opposed the mahomedans, and the armies met at Peshawar. The battle was long doubtful but, at length, Anangpal fled leaving 20,000 dead on the field.

Mahmood, in A. D. 1008, captured the temple of Nagarkot from which he is said to have carried off 1,100 maunds of pure gold and silver plate and jewels. In A. D. 1011, he captured the temple of Thaneshur and sent 200,000 captives to Ghazni laden with all the costly idols and wealth. His seventh and eighth expeditions both unimportant were to Cashmir. His ninth was in A. D. 1017, he marched with 100,000 horse, and 20,000 foot. He conquered Canouj and took Muttra, which for 20 days he gave up to plunder and all the idols were either melted down or demolished. His tenth and last expedition was directed against the temple of Somnath, in 1024, which he took, after a severe fight, in which 5,000 hindus fell. He obtained great wealth here. In A. D. 1028 he conquered Persia, from which he returned to his capital where he died A. D. 1030 at the age of sixty. He left two sons, Mahomed and Masood, with whom commenced a period of anarchy. At the time of Mahmud's invasions, India appears to have been divided, and perhaps had been so for centuries before, amongst a host of subordinate chiefs each owing homage to one of four considerable states. These four were, Delhi, under the Chahane; Canouj, under the Raktore; Mewar, under the Gehlote; and Anhilwarra, under the Chaura and Salunkhi dynasties. Delhi included the territory westward from the Aravalli to the Indus, and northward to the Himalaya; Canouj extended eastward to Benares, and comprehended a portion of Bundelkand. As he sacked and plundered Muttra on the one hand and Thaneshur on the other, had Delhi possessed any importance, it was not likely to have escaped him. It was not until Anangpal II had rebuilt Delhi in 1052 that it was again a populous city and its inhabitants an opulent and luxurious people. Firdusi, author of the Shah Namah, a Persian poem, wrote it at the request of Mahmud of Ghizni, but, disappointed of the promised reward of 30,000 drachmas, he returned to Thos his native city and there died.—*The British world in the East, Ritchie Vol. I p. 26. Tr. of Hind. Vol. II p. 158.*

MAHMUD, the 6th of the Kharasmanian dynasty, was driven out of Ghazni by Chengiz Khan in 1218 and died in 1220 — Orme.

MAHMUD, called sultan Mahmud, reigned at Delhi in 1398. He was the grandson of the emperor Feroz and was conquered and expelled by Timur.—Orme.

MAHMUN, great grandson of Bappa, invaded Cheetore from Khorassan but after twenty-four engagements was defeated and expelled.

MAHOE. See Dyes.

MAHOGANY. Caoba, of the Spaniards, Swietenia mahogani, named after Gerard van Swieten, a physician of Leyden is indigenous in the West Indies and Central America, and naturalized in some parts of India. It is a lofty tree with a large spreading head and glossy pinnate leaves. The trunk frequently exceeds 40 feet in length, with a diameter of 6 feet. The timber is of a rich red-brown, of different shades and markings, capable of a brilliant polish, close-grained, very little liable to warp or shrink, and having a semi-resinous juice which preserves the wood from the attacks of insects. The value of the best Spanish mahogany may be judged of by the fact, that the Messrs. Broadwood gave £3,000, for three logs of fine mahogany, each 15 feet long and 38 inches square. These logs were the produce of a single tree. The wood was exceedingly beautiful, and when polished, it reflected the light in a varied manner, offering a different figure in whatever direction it was viewed. Generally speaking, the purchase of this wood is a sort of lottery and dealers in mahogany often introduce an angur before buying a log; but this does not always enable them to judge with precision respecting the quality of the timber. Honduras mahogany grows mostly upon moist low land, is generally soft, coarse, and spongy. It has, however the advantage of holding glue admirably, and is in consequence, much used as a ground on which to place veneers of the finer sorts of mahogany. The mahogany of Cuba and Hayti, and of the islands in general, is close-grained, dark coloured, and sometimes highly figured: it is known as Spanish mahogany. The colours are brought out by the application of oil or varnish, but much washing or soaking of the wood in water will destroy its beauty and render it of a dingy brown. The colour of mahogany is often artificially deepened by alkaline applications, but the best effect is produced by the use of a colourless varnish, which allows the natural tints of the wood to be displayed unaltered. The first mention of this beautiful timber occurs in 1597, when it was used to repair some of Sir Walter Raleigh's ships at Trinidad. Yet the timber was not brought to England until about the beginning of the eighteenth century when a few planks brought over as ballast in a vessel from the West Indies, were given

MAHOMED.

to Dr. Gibbons, and would have been used, but for their hardness, by his workmen in erecting a house in Covent Garden. Having been rejected by them, a piece was given to a cabinet maker, named Wollaston, with the request that he would make a candle-box of it. This being done, the candle-box proved so beautiful that it became an object of curiosity, and the despised mahogany came into great request, and was soon established as a valuable material for household furniture. The genuine mahogany tree may be seen in some Indian gardens, where it appears to flourish. The Mahogany grows as well in Bengal as in its native country, and though inferior in fineness of grain to the best kinds, it is at least equal in quality to that of Jamaica. Dr. Roxburgh in a paper presented to the Society of Arts in 1806, on the growth of trees in the Botanic Garden at Calcutta, mentions that two plants (the first introduced into India) were sent by the Honourable the Court of Directors to the Botanic Garden in 1795, and by the end of 1804, above five hundred plants had been reared from these two.—*Faulkner, Tomlinson, Mason. Soc. of Arts Trans. Vol. XXIV p. 154. Royle's Productive Resources of India.*

MAHOMED, the founder of the mahomedan religion, was born on the 10th November 570 and died on the 8th June 632, in his 63rd year. The Arabian prophet, the Apostle, are terms sometimes applied to him in European literature, but his followers only recognize the appellations of Râsul Allah, the messenger (or prophet) of God, also Paighambar, the bearer of a message. He was of the tribe of Koresh: his great grandfather's name was Hashim; that of his grandfather, was Ab-ul-Mutalib, whose son Abd-Ullah was the father of Mahomed. Mahomed is generally supposed to have been of Ismaelitic origin, of the tribe of Kenanah. In Genesis, Ismail is made to marry an Egyptian woman, but Arab traditions make him marry into the family of Jorhem, a descendant of Kahtan. Probably he had two wives. The Kenanah tribe, from which he sprung, was near akin to that of Kais, and both were descended from Nezar, whose name was the war cry of the northern Arabs, in their combats with the armies of Yemen. The descendants of Kahtan, Arab ul Arab, were held to be the noblest of all Arabia and it is surmised that this alliance was introduced to raise Mahomed into the noble families of Arabia.

The melancholy incidents associated with almost every step of Mahomed's birth and parentage deepened the seriousness and

MAHOMED.

heightened the sensibility of his character. He was a posthumous child, orphan of both father and mother at five years of age, among a people with whom to be an orphan was a disgrace. How deeply he felt his unprotected state is evident from the earnestness and frequency with which in the Koran he recommends orphans to the care of the Faithful. The life and destiny of his father Abdullah was also peculiar, for he narrowly escaped being offered in sacrifice to an idol, in consequence of a rash vow of Abd-ul-Mutalib, and was only rescued at the price of a hundred camels. Mahomed was born during the period of tears and desolation of his mother, Aminah, after the death of her young husband, at the age of twenty-five, on a caravan journey; when born, he was carried by his grandfather before an idol, and received his name. Unable to nurse her own infant, his mother, after Arab fashion, wished to send him to the desert to be reared; but the Bedouin nurse who ultimately took him at first refused to have charge of a fatherless boy. At six years of age Mahomed lost his mother also, and was taken care of by his grandfather, and on the death of the latter three years later, by Abu Taleb, his uncle, who as long as he lived gave him his protection. The events known of his youth are few. He appears to have accompanied his uncle to Syria, and on that journey mahomedans place the absurd legend of Sergius, Djerzi, or Bahzia recognising the boy as the future prophet by a mark between his shoulders. During the wars of the tribes known as the wars of the Fidjar, he is reported to have been present at one battle when he was fourteen, and to have picked up arrows for his uncle; at twenty he was keeping sheep for something like a farthing a day—an occupation considered disgraceful by the Arabs and abandoned to slaves and women. But Mahomed always loved to dwell on the fact that Moses, and Jacob, and David had been shepherds before him, and indeed the race of visionaries and prophets has generally been largely recruited among shepherds and herdsman. Not long afterwards he entered the service of Khadija, a wealthy trading widow with three children, as camel-driver of the caravans which she despatched to the different markets of Arabia and Syria, and rose by his good conduct to be master of the caravan, a position of confidence. He was found a good man of business, and to have an acute perception of the market value of the striped stuffs and incense of Yemen, and the leather of Arabia, which he exchanged in the markets of Syria for corn

MAHOMED.

and oil, and the silk goods of Damascus, while his long monotonous marches across the desert with his long file of camels were perhaps spent in meditation. His good qualities gained him the title of 'El Amin'—the honest fellow. He was of comely appearance, and Khadija, in spite of being fifteen years older than Mahomed—an immense difference in a country like Arabia—conceived the project of marrying him, and carried it into execution. For such a marriage, Mahomed seems to have been an exemplary husband. He married another wife, it is true, in two months after Khadija's death; but he never ceased to speak of his deceased wife in such terms of praise, that Ayasha declared she was the only one of the prophet's wives of whom she had ever felt jealous. Seven children were the result of this marriage; and throughout the East crowds of green turbans claim to be descended from some one of the three daughters who survived. There were three sons, who all died young—one was called Abd Manaf, after the idol, which proves that Mahomed was at that time still an idolater. The last daughter, Fatima, was born eleven years after the marriage—when Khadija was beyond fifty. Four years after the birth of Fatima he had his first vision, and in connexion with that event some considerations are necessary respecting his mental and bodily constitution. Whatever may have been the superiority of his moral character, it is certain that he was as unlike the most esteemed type of Arab manliness as it is possible to conceive. Nowhere in the world does man reach such a degree of dauntless independence as the Arab, educated in the freedom of the desert, and exposed to its hourly and daily vicissitudes of destiny. The ideal of the Arab was a fiery-souled irresistible warrior, always in sight of his tribe, bold in speech, rapid with song and repartee, indulging in wine, feasting, gambling, and love of women, holding tears to be disgraceful, with limbs as iron as his armour, supporting without suffering the heat of the desert under an Arabian sun, delighting in the beauty and swiftness of his steed or of his camel, impassioned for the chase, a match unarméd for the lion, indefatigable in combat, and routing like Antar whole armies with his single spear and shield. Recent travellers have confirmed the experience of ages, that the Bedonin have the least religious sensibility of any known race—at the present time they are mere mahomedans in name, and never utter a prayer, or if they perform any religious rites at all, these may possibly be some lingering of the old Arabian adoration of the sun, expelled by

MAHOMED.

ing sun. In the days of Mahomed, the people of Mecca upheld the worship of their idols from motives of gain, but Arabs in general had little respect for them, and treated them worse than Neapolitans have ever treated a refractory saint. If the prophecies of their kalim, seers or holy men, did not concur with their wishes, they often put them to death. When Amr-ul-Kais commenced an expedition to avenge the death of his father, he entered, according to custom, the temple of the idol Dhoul-Kholosa, to obtain his approbation by means of the divining arrow. Drawing the wrong arrows three times in succession, he broke them all and threw them at the head of the idol, saying: 'Wretch! if your father had been killed, you would not forbid revenge for his death!' Mahomed was directly the opposite of the Arab ideal; he had inherited from his mother a delicate, nervous, and extremely impressionable constitution. He was gifted with an exaggerated and sickly sensibility; he had a woman's love for fine scents and perfumes; he was melancholy, silent, fond of desert places, solitary walks, and lonely meditations at set of sun in the valleys; full of vague restlessness, weeping and sobbing like a child when he was in pain; subject to attacks of epilepsy, and without courage in the field of battle. In addition to all which he had religious excitability of the most acute character.

Mahomed in the Koran asserts that his religion is that of Abraham. The religion established by Mahomed is termed Islam, signifying safety or salvation and comprises the two essentials, "iman" implicit faith and "din," practical religion. Five points are insisted on namely—Belief in God and Mahomed his apostle—Prayer—Alms-giving—Fasting during the month of Ramazan—Pilgrimage to Mecca. The first of these belongs to "iman"; the latter four to "din." Mahomedanism as it now exists, stands upon other foundations than the Koran. This book not furnishing a guide or precept to meet every emergency, a great body of tradition, nominated the "hadees," has been added thereto; and this law, oral as it originally was, is generally considered equally binding with the written law of the Koran. These traditionary precepts were derived from Mahomed himself, his companions and immediate successors. Some of them are, however, of doubtful authenticity, and not a few are evidently of more modern fabrication. The Persians reckon four kinds of hadees. At present the followers of Mahomed are styled Mahomedans also Mussulmans also by the following terms;

MAHOMED.

Muslim (Sing)	ARAB.	Mahomedan,	ENG

In the time of the emperor Jehangir, in India, the hindus were estimated as 5 to 1 mahomedan. Mr. Elphinstone's estimate was 8 to 1, another estimate makes the relative numbers, as $6\frac{1}{2}$ to 1 or about 17 per cent. of the population as mahomedans. At this last rate, of the 200,000,000 of people in British India and in the subordinate feudatory states, there would be about 34,000,000 of mahomedans. But all over non-feudatory India, the number does not exceed twenty-five millions, or one-seventh of the population in British India. They are most numerous in the Northwest and in the Madras provinces and gradually diminish in numbers towards the East.

In India, the people of this religion are of the most varied descent, the offspring of Arabs of every tribe, from the Iranian races of Persia, from the Scythic, Tartar, Mongol, Turk, Baluch and Afghans, with bodies of converts from the Agnicula Rajput, from the Jat, and from the prior Tartar tribes who preceded the Aryan immigrants. In the northern parts of India, the bulk of the mahomedans are of Tartar or Afghan descent, and recognise themselves by the titles of moghul and pathan, ordinary Arab mahomedans being sheikh. It was chiefly to rulers, often merely nominal, of these religionists, to whom the British power succeeded.

The most prominent and numerous of the monotheists of India are the descendants of the various mahomedans, who from time to time as conquerors and camp followers, entered India with Timur, Nadir Shah, Mahmud of Ghuzni, Ahmed Shah and others, and have sought employment in the armies of India or a livelihood by commerce. A considerable portion of them are engaged in trade or as petty dealers in towns. A few of the humbler are employed as labourers: but the majority have hitherto found military employment under rulers of their own faith in Delhi, Hyderabad, Arcot, Lucknow and Rohilkund, or in the native Indian armies of Great Britain. A portion of these people are doubtless of Arab descent, and many of them are syeds or descendants of Mahomed. The British, however, also come in contact with mahomedans of the Semitic race, the Arabs

MAHOMED.

at Aden, many of whom in the first ages of the Hijra spread their power into Africa, and along the shores of the Mediterranean, crossing into Spain which they held for 700 years, overrunning countries to the eastwards and northwards in Khorassan, Merv, Ispahan and Bokhara, to Bagdad where the race of Al Abbas reigned for five hundred years, and to Damascus, where the Oomniash family held sway from A. D. 661 to 744. On the western frontier of India, in the Panjab, and in the territories lying between the Indus and the Ganges, the mahomedans are chiefly Scythians of Mongol, Turk, Afghan and Baluch descent, with other smaller bodies as to whose origin, information is wanting. There are the Multani, Bhatti, and Khurni of the Rechnab Doab in the Panjab: the Awan of the Sind Sagor Doab: the Dawudputra of Bhawalpor, the Tuwana of the Shahpor district, the Mewatti of Goorgaon and many of the Goojar race, scattered through different parts of Northern India. In the northwest Provinces are the Rohilla of Rohilkund and the Kourboh of Meerut, likewise mahomedan. There are mahomedans also in Bhopal, Maudisor and Joura; the late rulers of Oudh were Syeds, the late rulers of Hyderabad in Sind'h were Baluch, and the rulers of Hyderabad in the Dekhan are Syeds. The Daood-Putra mahomedans trace their descent to the Kalif Abbas but take their name from Daood, the first of the family who acquired a name. They are, however, supposed to be Sindian Beluch, or Beluch changed by a long residence in Sind. They moved from Bahawalpore and seized land on the Sutlej reducing the remains of the ancient Lungga and Johia, and introducing the Sind system of canal irrigation.

Their claim to be descendants of the race of Al Abbas, who reigned at Bagdad from A. D. 749 to 1258, may however be correct. The sur-names met with, Gori, Kirmani, Koreshi, Sherazi, show their possessors views as to their origin and the tenacity with which the families look to their original starting places. All Afghans, while in India, carefully distinguish themselves by their tribal names, the Eusofzye, Mohmund, Barukzye &c. The Wallajah family, who for a few years, had a troubled rule in the Carnatic, traced their descent from the khalif U'mar, A. D. 644, and in their conversations would notice the course of their fortunes as having had amongst them a khalif, akazi at Samarcand, and nabobs of the Carnatic, and it will be recognised that races who, as in this instance, can take a retrospective view of their

MAHOMED.

history for 1280 years, can disregard hundreds of years of obscurity, and can see in that long time only the dignities possessed by three ancestors, a Khalif a Kazi and a Nabob, will readily accept a reverse of fortune as God's hand laid upon them, will regard it as but of temporary duration, and will watchfully await a change.

In Peninsular India, there are only small scattered bodies of mahomedan races. The only ruling power in India, of these religionists, of any magnitude, is that of the Syeds of Hyderabad, the Nizam Subahdar of the Dekhan, whose sway has existed for nearly two centuries, themselves strangers, ruling with a mixed foreign soldiery of Arabs, Negroes, Abyssinians and northern hindus, over parts of the Canarese, Tiling, Maliratta and Gond races, and their capital is now the principal resort of mahomedan adventurers. In the extreme south of India, there are three mahomedan races, the Labbi and the Nao Aiti, differing, by very marked characters, from those around them. The Labbi are a tall and large made race, of a deep bronze colour. Their usual dress consists of a wrapper round the loins. They are largely engaged in mercantile business and as pedlars. They use the Tamil alphabet, have a Tamil Koran and speak and read the Tamil language only. Their name is derived from the Arabic word "Labek," "may it please you," and the people are usually supposed to be descendants of trading or sailor Arab fathers with mothers of India, but this alleged origin seems to admit of doubts. Nao-Aiti, a small non-military body of Arabs who but for a slightly xanthous tinge, would have an almost English fairness, called Nao-nit, new comers, emigrated from Arabia about three hundred years ago, and are to be found in considerable numbers in southern India. They are slender, fair men with very handsome women, and are engaged in civil avocations, never becoming soldiers. They say that they came from Arabia to the Konkan. The Nao-Aiti are also supposed to have been sea-shore Arabs. Indian mahomedans assert that they are the descendants of women and children from Arabia, whose men were killed on being detected in an attempt to rob the tomb of Mahomed and their wives and children were sent off in a ship which landed on the western coast, but this is doubtless a story got up to vilify a race.

The Maiman or Mehman are said to be the descendants of a couple, of Sind, long childless, who about six hundred years ago became converts to mahomedanism, in consequence of the prayers in their behalf

MAHOMED.

by Mahbub Sub'hani at Baghdad, being rewarded by seven children. Their original language is Sindi. They greatly revere Mahbub Sub'hani. Many families are met with in Guzerat and Bombay, and are a useful, hard working, trusty mercantile people.

The Mopla in the South western coast of India and Ceylon, are said to have had a similar origin to the Labbi, viz., from Arab fathers and Indian mothers and the name is supposed to be derived from the Tamil, ma, mother, and pillai, son. On several occasions since that part of India came into the possession of Great Britain they have required to be coerced, and are known to possess a restless spirit, with much fanatical zeal; but it is generally supposed that agrarian disputes have been a prominent cause of their outbursts. The Mopla of North Malabar, although mahomedans, follow the rule, as to property, of *descensus a Matrice*, the Marumkatta tayan, having, in this respect conformed to hindu usage, in the times of the ascendancy of the hindus. The Mopla also take the wife of a deceased brother.

The Chulia, Moplah or Labbi are called by the Tiling, Jonangi, Zonangi, Jonagar, Jonakari. The intercourse of Mahomedan merchants and sea-men with the women of western India seems to have been from the most ancient times, Abnzaid writing A. D. 916 mentions that the more devout merchants of Siraf when young men were on board avoided sending their ships to Ceylon, as the women were very licentious and merchants would, when newly arrived make advances to the daughter of a king and she with the knowledge of her father would go to meet him in some woody place.

In Sumbawa, the mahomedans take a high place and they are largely proselytising the mountaineers, who however secretly trust in their idols.

There are many thousand mahomedans in China, who are neither zealous in the propagation of their doctrines nor over-strict in the observances of their religion.

The Abyssinian and Negro races in India are usually known as the Habshi or Sidi. Many of them are slaves, but both as slaves and freemen they are often employed about the households of native sovereigns. Some of them, known as the "Seedee of Janjera or Zanjera," were long a powerful and independent maritime people, occupying the coast a few miles south of Bombay. The Bohra are found on the N. western coast of Peninsular India and in the Rajpoot states, and represent themselves to be the descendants of the followers of the Sheikh-ul-Jabl, or the celebrated old man of

MAHOMED.

the mountain. They call themselves Ismaili, acknowledge an Archamandrite or religious chief: they principally follow mercantile pursuits, and are a robust, active, intelligent mercantile race. They are scattered all over the country, but are found principally in Guzerat and the adjoining provinces of Catch, Sind and other parts of the Bombay presidency, and are a peaceable, inoffensive body of men.

Another tribe is styled Khajah, which in Persian, signifies a bard, a teacher, and a merchant, but is sometimes, as an honorific appellation prefixed to an individual's name, as Master, or addressed to a person, as we should say "sir." It is the "Coja" of the "Arabian Nights," which was the French orthography of Khajah. It is applied as a titular appellation to a small tribe of strangers settled in Sind, principally at Karachi, where there are about 300 families, who say that they emigrated from Persia. They are Ismaili mahomedans, and are, therefore, heterodox shiahs, —for, while the Ismaili believes only in seven Imams, the Khajah continues the line down to the present day, Aga Khan, lately (1861) a pensioner of the British Government, at Bombay, being their present Imam. They reject Abu Bakar, Umar and Usman, and reverence Ali, Hassan, Hussoin, Zain Ul Abidin, Mahomed-i-Baker and Imam Jafar-i-sadiq. They do not worship in a mosque but in a Kano or house prepared for the occasion. They probably fled from Persia, when Ali Khan (Hulukan) treated the Ismaili sect with such severity. They are in general illiterate, but have invented a written character for themselves, in which they have transcribed the "Koran. Captain Burton however says, that the Kojah are a small caste in Western India, who appear to have originally come from Sindh or Cutch, and who by their own traditions, which are probably correct, were converted from hindooism about 400 years ago by a Pir named Sudr Din. They know but little of their prophet and of the Koran, and their chief reverence is reserved for Aga Khan, whom they believe to be a descendant of the Pir who converted them to Islam." When reading this, however, it must be remembered that the shiah branch of the mahomedan creed, whenever settled amongst anti-religionists, always hold as a tenet, and rigidly adhere to the practice called Takeyyah, i. e., the systematic concealment of everything that concerns their faith, history, customs, and in a word any peculiarities the disclosure of which might be attended with unpleasant consequences.

MAHOMED.

The Mehdivi or Ghair Mehdi are not a race but a small mahomedan sect, though mostly Pathans, who believe that a religious man who was born in Jonepur about three hundred years ago was Mehdi, or the prophet Elias on his second coming, and they are styled Ghair or "without" Mohdi because he has, in their belief, come and gone.

The mahomedan religionists are however of two great sects the Sunni and Shiah, the former being in India, Turkestan, Turkey and Arabia the more numerous, while the Shiah are most numerous in Persia. The Sunni hold amongst other points, the succession to the khalifat to have followed in the line of Mahomed, Abu Bakr, Omar, Usman and Ali; the Shiah sect, on the other hand, maintaining Ali to have and by right succeeded his cousin and father-in-law Mahomed. There are other points on which their sectarian differences turn; but small numbers of the Shiah religionists, in several parts of Asia as in the west of India believe in incarnations of Ali, and of these the Ismaili body may be instanced. The mahomedans of India, of these two great religious sects worship apart; but amongst both sects are to be found mixed together, the people of the various national or ancestral tribes, Syed, Shaikh, Moghul, Pathan, into which the mahomedans are found arranged and as in some christian countries the sons will be found as Sunni and the daughters Shiah. The Syeds, the Saadat, or lords, are descendants of Mahomed, through his daughter Fatimah and her husband Ali, and as a rule are quiet, humble minded men not distinguished by other qualities from the Sheikhs: they are of Sunni and also of Shiah persuasion, and are met with serving as soldiers, or in civil avocations or following some religious duties. The term Sheikh is given to other descendants of Arabian origin, and is applied generally to all of the Sunni sect other than pathans or moghuls. The Sheikh therefore is of the most varied origin, and is engaged in all avocations, military and civil, as soldiers, in regular and irregular armies, as police, shopkeepers, and a very few, a mere sprinkling of them, in learned professions or occupations requiring prior education. The Pathan is the descendant of the Afghan soldiers who came into India with the armies of Timur, Baber, Nadir Shah, Mahmud and Ahmad Shah Abdallah and carved out principalities or obtained lands for themselves, and their descendants; but there are numerous individuals of the Afghan and

MAHOMED.

Baluch tribes, large, powerful, fair men scattered throughout India, who are seeking a livelihood in it as soldiers, traffickers and chapmen. The Pathan styles himself by the designation of Khan, but this is never permitted at courts, Khan being one of the honorific appellations bestowed by Indian sovereigns.

Moghuls assume the suffix of Beg. They are comparatively few, in number, are generally fair people, of a larger physical frame than the Arab-mahomedans and are all of unassuming manners. Of all these religionists, few have taken to agriculture; a very small number have fitted themselves for the civil situations available under the British Government, except in entering the disciplined armies of Britain as private soldiers, and forming perhaps one-fourth of its Indian forces, very few of them have accommodated themselves to the changes which the British supremacy have introduced. They are essentially a people not belonging to the present time, but dwell on the past and look forward to the future, the religious among them meditating on the transgressions which have brought upon them the great reverses from the British arms and all, perhaps without exception looking forward to the time when it shall be God's will again to give them dominion. As a whole, they are earnest, ardent men, who can be easily excited. As soldiers, they are patient and have an "elan" in warfare which the steady calmer hindus in Southern India do not possess. Their religious feelings, for many years past, have been personal, and though dwelling and ruling in parts of India since eight-hundred years, and though holding an essentially proselytizing faith, they have not made many voluntary conversions from hinduism, either from the Arian family or from the non-hindu servile classes,—perhaps nothing has ever taken place from the efforts of mahomedans like the upheaving, which a few years ago occurred in the Punjab or has for some years past been agitating the races in the extreme South of the Peninsula. In India, as a body, they are illiterate and even as regards their religion, they have acquaintance only with a few formulas, in the Arabic language. Their book, the Koran, has been translated, into Persian, Hindustani, English, Tamil, Burmese and Malay, but in India, the Arabic is deemed the more sacred language, although so very small a number of them can read that tongue, so as to understand it, that in Madras with 70,000 Mahomedans it is supposed only four or five can read and understand the Arabic Koran. The spoken language

MAHOMED.

of mahomedans in India, is the Urdu or Camp tongue, called in the Peninsula, Hindustani, which, since the beginning of the nineteenth century, under British influence, has become a written tongue and a few books have been printed in it; but the educated of the higher classes all use Persian as their sole means of communication. Living as they have been amongst a body so highly educated as hindus are it is perhaps this want of learning that has blunted their proselytizing efforts, the only great change which their religion has effected having been amongst the Sikhs, whose faith is a modified hinduism and mahomedanism, and it is possible that the huge endeavours now being made by the British to educate the masses in India will in the end have greater success, for christianity; but in so saying it must be remembered that though the Arians have been pressing their brahminical creed upon the Turanian races for the past three thousand years, they have only got from some of them an outward assent to the brahminical forms, and a recognition of the institution of caste, and that everywhere throughout India, there are being worshipped a multitude of idols, of gods, and heroes, and devils and forms and incarnations, of whom the Vedas and Puranas make no mention, and whom the brahmins do not recognise,—the chief success that brahminism has achieved in India being the suppression of buddhism, a purer faith than its own. The Arian hindu is undoubtedly a meditative, reflecting, longing mind. But if the total absence of all extraneous objects could have attracted hindus to enquiry, the presbyterian churches and the mosques in India are all that could be desired. In Egypt, mosques are matted or carpeted, over which is spread the chandni, a carpet of white cotton cloth. But in India, the ordinary flooring is of stone slabs and usually the sole object to be seen is a small pulpit niche, the mihrab, and near to it, the mimber or two steps built on the wall next to Meccah, on or near which the Kazi, Mulvi, or Imam stand. There is nothing to distract the worshipper's attention and every one seems absorbed in devotion. The Revd. Norman Macleod, D. D., (Eastward p. 67) alludes to this, and says that the whole service imparts the impression of worship to an unseen God. It is perhaps something in their character, either original or acquired, or in their faith, or, perhaps, to their being accustomed to a more out of door life, that enables them so entirely to abstract themselves from their ordinary avocations and to engage with such reverend earnestness, in prayer. But every traveller

MAHOMED.

in the East must have seen mahomedans spread their carpets on the ground, or place their staff or sword in front of them, and bend their knee in lowly homage to their Maker, and, in all the bustle of a crowded bazaar or on ship board, remain apparently as much abstracted as if in a desert. Mahomedanism, adds the reverend author, owes its origin to Judaism and Christianity: like them is derived from Abraham and is the worship of the one God, and christians, he thinks, are apt to undervalue the good obtained from its divinely reflected beams, which in some degree irradiate spots that would otherwise be in outer darkness. Mahomedanism was perhaps seen in its brighter aspects at Baghdad during the khalifat, and at Cordova, to which christians repaired for a liberal education. But, in India, it has ever been a mere ritualistic worship, with certain dogmatic formulæ in Arabic words the meanings of which are known to very few even of those acquainted with the words themselves. Distributed as these religionists are, from the Atlantic, through Africa, Europe, Arabia, Persia, India and China, to the islands of the Pacific, the acknowledgment of the Koran by all of them gives a certain similarity to their religious observances, but the customs of social life in all these varied nations are as varied as are the nations themselves. In India, there are ceremonials before and after childbirth, such as congratulations to the young wife on the seventh month after her pregnancy. As in the Hebrew law, there are forty days of ceremonial after the birth of a child when the "chahlam" or fortieth day ceremonial is performed; and on the naming of the infant and each stage of his development, in childhood, entrance at school, are all attended with certain forms. There is no time rigidly adhered to for circumcision, and grown up lads have not, unfrequently, remained unattended to, for in India the authorized time is spread over from the seventh to the fourteenth year. The coming of age of a girl amongst the hindus is made known by noisy music, a practice which is imitated by the humbler mahomedans, though educated and noble families abstain from all such rude rejoicings. Very few of the mahomedan women of India can read and still fewer can write. But in towns, amongst the better classes, all boys are sent to school, and their infant education is conducted in such a manner as ineffably to fix their faith. At the age of four years, four months, and four days, each child is taught to pronounce the name of God with much ceremonial,—with more

MAHOMED.

even than is shown when children of the Episcopal persuasion in England are confirmed, for the ceremony is made to last for days. The boy is then taught the first words that were revealed to Mahomed. They are recorded in the 96th chapter of the Koran which says "Read in the name of thy God, for He it is who hath created all mankind out of a lump of coagulated blood. And He is likewise that Almighty being who has blessed us with the voice of utterance and taught us the use of the pen," and, until the lad has read the Koran (many of them learning it all by heart and then receive the designation of Hafiz) and until they have been carefully instructed in all the books of their faith, the lad is not allowed to read any other tongue. The Reverend John Anderson and the Rev. Mr. Braidwood when in Madras spoke on this subject of the conversion of these religionists and, when made aware of this early education, they felt how almost ineradicably the dogmas of the mahomedan creed, must become fixed in the youthful minds.

In the mahomedan belief, there are five divine commands, (a) the confession of their faith, the creed or the Kalma; (b) Namaz (prayer); (c) Roza (fasting) during the Ramadan; (d) Zukat (almsgiving) to a tenth of their goods and (e) the Haj or pilgrimage. In their marriages the Indian mahomedans are united by the civil and religious rite, the Nikah, similarly with all other of their co-religionists, but to this has been added several days of costly ceremonial rejoicings (Shadi), which they have gathered from the hindus. Divorce, in India, is almost unknown, for at the Nikah, the dower which the bridegroom promises is a fabulous sum, which no one can pay and as, until paid, divorce (tallaq) cannot be concluded, no one in India is ever divorced. The Indian mahomedan of the population lives faithfully to his one wife, and polygamy is almost unknown, except amongst the loose livers of great towns. The Ramadan month of fast, is very strictly attended to, but amongst the Sunni in the south of India the Maharram is a period of extravagant amusement, in which many non-hindu and many hindu races join. The Sunni, by far the majority, at this period grossly outrage the grief of the Shiah sect and scandalize the learned and devout. In Southern Asia, there is a great reverence shown to saints' shrines and foot marks. Amongst these are the tombs of the Pir-i-Dastagir, at Baghdad; of Kadirwali at Negapatam, and the footprints of the prophet at the Kadam Rasul hill near Secunderabad; to which, multitudes annually resort. The great religious festivals, holi-

MAHOMED.

given credence to. The wild hunter tribes of America have sublime notions of a future life; hebrews were in conflict as to the immortality of the soul; the buddhists believe in absorption or annihilation as a release from all the troubles and trials of a mundane existence, and christians believe the future to be a spiritual life, but the doctrines taught in the Koran as to the occupations in heaven are wholly confined to that book and its believers. For, there, the Koran says (Ch. lv., pp 393-394.) "they shall repose on couches the linings whereof shall be of thick silk, interwoven with gold; and the fruit of the two gardens shall be near at hand to gather. Which, therefore, of your Lord's benefits will ye ungratefully deny? Therein shall receive them beautiful damsels, refraining their eyes from beholding any besides their spouses, whom no man shall have deflowered before them, neither any genius; (which, therefore, of your Lord's benefits will ye ungratefully deny?) having complexions like rubies and pearls *** And besides these, there shall be two other gardens: *** of a dark green. In each of them shall be two fountains pouring forth plenty of water ** In each of them shall be fruits and palm trees and pomegranates. ** Therein shall be agreeable and beautiful damsels: ** having fine black eyes; and kept in pavilions from public view: ** whom no man shall have deflowered, before their destined spouses, nor any genius. ** Therein shall they delight themselves, lying on green cushions and beautiful carpets."

Such is the mahomedan heaven. Mahomed was a monotheist and an iconoclast. Before the final struggle, lifting up his voice he exclaimed, "May God be far from those who make the tombs of his servants places of prayers." The very last words he was heard to utter as he expired, as if in answer to an unseen visitor, were, "In the company of the blest on high."

Ali the son of Abu Talib, was the cousin and companion of Mahomed, also his son-in-law, he having married Fatimah, Mahomed's only surviving child; he was the first of the family of the Koreish to adopt the new faith. Notwithstanding these claims, and his personal merits and valour, on the death of Mahomed, in his 63rd year, in A. D. 632, and in the eleventh year of Hejira, Ali was not recognized as his successor, but Abu Bakr was so elected, and after a reign of two years was succeeded by Omar who was assassinated in the twelfth year of his reign. He, again, was succeeded by Othman, and then, in A. D. 656, by Ali

MAHOMED.

With Ali's rule severe political convulsions ensued. The earliest arose from the intrigues of Aesha and after such were settled, the governor of Syria, Moawiyah ibn Abi Sofian, threw off his allegiance to Ali and had himself proclaimed Khulif of the western provinces. An appeal to arms resulted in the defeat of Ali, after a desultory war of 102 days, and Ali then retired to Kuffa in Chaldaea, on the banks of the Euphrates. The people of Karund in the south of Persia believe Ali to be a god, and they are styled the Ali Illahi. The shiah sect of mahomedans consider that Ali ought to have been the first khulif. In Khorasan, Ali is usually styled Shah-i-mardan "King of men."

The khujah sect, the entire Ismaili sects all worship Ali as an incarnate deity and the present incarnation (1867) is Aga Mahomed, a pensioner of the British Government at Bombay.

The tombs of mahomedans have usually been of earth, or unbaked brick, but every material is employed, and names are even engraved on the tomb. The tomb stone of a man is distinguished by a raised part in the centre, and that of a woman by a depression. The prevalent form in India of mahomedan tombs of the rich is a dark or black tomb-stone with verses of the Koran engraved on it, and covered by a cupola. Some of these are very magnificent. Those of the Adal Shahi dynasty at Bijapore and Gogi have attracted much attention, as also have those of the Brahmini dynasty at Gulburgah and Kutub Shahi dynasty at Golkondah. The cupolas at Roza where Aurungzeb is buried have not any display, and that of Aurungzeb is the least ostentatious. His daughter's tombs at Aurungabad is magnificent and many of the tombs at Delhi and Agra are great structures. That of Mumtaz Begum, known as the Taj Mahal is particularly remarkable. The reformers amongst the mahomedans consider that unbaked brick or earth should alone be used. The protestant christian doctrine that man, in all that he can do of good, is still without merit, is not shared in by the mahomedans, the buddhists or hindoos, who consider that a personal merit is gained by their good doing, and a mahomedan passing a funeral turns with it a short way and lends his shoulder to convey the body to the grave, thereby bringing a merit on himself. Mahomedanism has made little progress amongst the Bedouis. They still turn towards the sun, as he is rising and go through certain formulas of adoration and invocation. They despise pilgrimage and the fast of the Ramazan, and they sacrifice sheep and camels at the tombs of their

MAHOMED.

kinsmen. The northern part of Africa, and a seventh part of Turkey, are mahomedan, most of Turkish Arabia, all Persia, Afghanistan, the Khanats of Khiva and Bokhara, parts of Turkestan, much of N. W. India, parts of the Archipelago. The manners of the Bedouins are those of extreme licence, and community would better express their relaxation of the mahomedan law, than polygamy. Mahomed himself, in the Koran, acknowledged that he could make nothing of them, they are beings movable as water, and incapable of receiving a permanent impression. In the Jowl, the Arabs long abandoned the very name of mahomedanism, for a local fetichism and semi Sabean worship, prayers to the sun and sacrifices to the dead. And though the Wahabi sect endeavoured to force it upon them in its most rigid form, they only met with a limited success.

Mahomedans are bound to recognise professors of mahomedanism, being enjoined to do so in the Koran; Do not say to one who meets you and salutes you, "you are not a true believer," and "O ye true believers avoid suspicions for suspicion is often a crime" are texts known to all and generally obeyed. Hence the pronouncing of the first part of the creed La ilah il Allah, there is no deity but God, entitles the speaker to a favourable reception.

Mahomedans in India are divided into the four great classes, Syed, Shaikh, Moghul and Pathan. The Arab shaikh are of three origins, the Koraishee, Mahomed's tribe; the Siddegee, Abou Bakr's tribe; and the Farooqee or Oomer's tribe. The Syed are all descendants of Mahomed through his daughter Fatimah. The Moghul are of two countries, the Iranee or Persian and Toogance or Turkish. The Pathan are mahomedans from Afghanistan. These classes may be and are often, indifferently of the shiah or sunnee sect of mahomedanism. There are other small sects and classes, as the Nowact, the Ghair-Mehdi, Ishmaelce, Lubbay, Bora, &c.

Mahomedanism comprises five divine commands. 1st.—Kulmah parhna, or confession of faith.

2nd.—Numaz karna, or prayers.

3rd.—Roza rakhma, or fasting.

4th.—Zukat dena, or alms-giving.

5th.—Makkay ka huj karna, or pilgrimage to Mecca.

The principal places for minor pilgrimages are the tomb of Ali, called Mash'hid-i-Ali at Nej'f near Cufa; the shrine of Imam Hosein at Kerbela, and that of Imam Raza at Mush'hid in Kho-

MAHOMED.

rassan, but all the numerous Imam-zadeh and tombs of holy characters, throughout the country, are visited. The minor pilgrimage is termed a ziyarat, as distinguished from the haj or great pilgrimage to Mecca. Of the mahomedan saints of India are Abd-ool-qadir surnamed Gows-ool-Azam the great contemplative, born at Jal, near Bagdad, A. H. 471 (A. D. 1078-79). He was endowed with great virtue and with the gift of miracles, had many disciples, and is still much revered. He is called Shaikh, but was a Syed, i. e., of the race of Hosein, and died in A. H. 571 (A. D. 1175), aged ninety-seven years. Where he died or was buried does not appear.

Sooltan Surwur, at Balooch, four coss from Mooltan, was distinguished for piety and purity of manners, and died as a martyr with his brother, fighting against a troop of idolaters, and was buried with his wife (who died of grief) and his son, in the same tomb. Several miracles are related as having happened at his tomb. A camel's leg, when broken, was forthwith made whole; the blind, the leprous, the impotent were cured.

Shah Shums ood Deen, Dariai, at Dopaldal in Lahore. He is stated to have had even a pious hindoo among his disciples. The latter having expressed a wish to go and bathe in the Ganges, the saint directed him to shut his eyes, when lo! the hindoo found himself among his relations and friends on that sacred stream, in which (as he supposed) he bathed with them. On opening his eyes again, he straightway found himself beside his spiritual guide in Lahore. His tomb is guarded by hindoos, who will not resign their posts to the mahomedans. It is also related that some carpenters having proceeded to cut down a tree which grew near his tomb, split it into many pieces for use. Suddenly a dreadful voice was heard; the earth shook, and the trunk of the tree arose of itself; the workmen fled terrified, and the tree did not fail to resume its flourishing condition.

Qutub Sahib, or Qutubud Din, near Delhi. He lies buried at Qootoob, a town near Delhi named after him, in which the late Shah Alum and many members of the royal family of Delhi are buried. His tomb is much frequented by pilgrims, he being one of the most renowned and venerated of the mahomedan saints.

Sheikh Baha ood Deen, Zakaria, born at Cotcaror in Mooltan. He was a great traveller, having it is said, overrun Persia and Turkey, and a disciple for some time of Shihab ood Deen Sohrmurdee at

MAHOMED.

Bagdad. He died on the 7th Sufur, A. H. 665 (A. D. 7th September 1266), and was buried at Mooltan.

Furreed-ood-Deen, born at Ghan-awal near Mooltan. He was so holy, that by his look clods of earth were converted into lumps of sugar. He was therefore surnamed Shakar-gunj, the treasury of sugar.

Sheikh Sharif boo Ali Qalandar, born at Panipat, a town thirty coss north-west of Delhi, to which capital he came at forty years of age, and became a disciple of Qoot-ood-ood-Deen. He devoted himself for twenty years to external sciences; after which he threw all his books in the Junna, and began to travel for religious instruction. In Asia Minor he profited greatly by the society of Shamis Tubreez and Mulvi Roomi. He then returned home, lived retired and worked miracles, and is said to have died A. H. 724 (A. D. 1323-24.)

Shah Nizam ood Deen Aulia, by some supposed to have been born at Gazna, A. H. 630 (A. D. 1622-3), and by others in A. H. 634 (A. D. 1236) at Badaam, a town in the province of Delhi where he lived. He died A. H. 725 (A. D. 1325), and was buried near Delhi, hard by the tomb of Qootoob ood Din. Through his great piety he was considered one of the most eminent saints of Hindoostan.

Kabir, a celebrated hindoo unitarian, equally revered by hindoos and mahomedans founder of the sect called Kabir Panthee or Nanak Panthee, from which Nanak, founder of the Sikhs, borrowed the religious notions which he propagated with the greatest success.

Baba Lal. A darvesh (and likewise a hindoo) who dwelt at Dhanpoor in the province of Lahore, the founder of a sect called Baba Lali. He held frequent conversations on the subject of religion with Dara Shikoh, eldest son of Shah Jahan, and brother of Aurangzeb, which have been published in a Persian work by Chundarbhan Shah Julance.

Shah Dola, died in the seventeenth year of the reign of Alimgaer, was at first a slave of Humayandar Sialkoti in Lahore. But he seems afterwards to have attained great affluence as well as fame; for, having settled at Ch'hotee Goojrat (little Gzerat), he built tanks, dug wells, founded mosques, and bridges, and embellished the city. And no wonder, for though his contemporaries came to visit him from far and near, and made him presents of gold, money, and other objects, he returned to each three or fourfold more than he received. His generosity was such, that had he been contemporary with Hatim Tai, no one would have mentioned the name of that hero.

MAHOMED.

Syed Shah Zoohoor, distinguished by his wisdom, piety, and austerity of life. He built a small monastery of earth at Allahabad, which still remains. He was celebrated for his miracles, and by his prayers the most frightful chronic complaints were immediately removed, of which an instance is given in respect to the case of the governor of Allahabad, nawab Omdat ool Moolk Ameer Khan Zoohoor boasted of having lived three hundred years.

Sheikh Mahomad Ali Hasin Jilani his tomb is at Buxar, where he died in A. H. 1180 (A.D. 1766-7, distinguished for his science, learning, and literary talents. He wrote in both prose and verse with equal skill.

The two most successful religious diffusions which the world has yet seen, are buddhism and mahomedanism. Each creed owed its origin to the enthusiasm of a single individual, and each was rapidly propagated by numbers of zealous followers. But here the parallel ends; for the Koran of Mahomed was addressed wholly to the "passions" of mankind, by the promised gratification of human desires both in this world and in the next; while the Dharma of Sakya Muni was addressed wholly to the "intellect," and sought to wean mankind from the pleasures and vanities of this life by pointing to the transitoriness of all human enjoyment. Mahomed achieved this success by the offer of material or bodily pleasures in the next life, while Sakya succeeded by the promise of eternal deliverance of the soul from the fetters of immorality. The former propagated his religion by the merciless edge of the sword; the latter by the persuasive voice of the missionary. The sanguinary career of the mahomedan was lighted by the lurid flames of burning cities; the peaceful progress of the buddhist was illuminated by the cheerful faces of the sick in monastic hospitals, and by the happy smiles of travellers reposing in dharmasalas by the road side. In the Mahawanso, p. 249, it is mentioned that Upatisso, son of Buddha Das, built hospitals for cripples, for pregnant women, and for the blind and diseased. Dhatusena (p. 256) built hospitals for cripples and sick. Buddha Das himself (p. 245) ordained a physician for every ten villages on the high road, and built asylums for the crippled, deformed, and destitute. The one was the personification of bodily activity and material enjoyment; the other was the genius of corporeal abstinence, and intellectual contemplation. There is a curious coincidence also in the manner of the death of the two teachers. According to

MAHOMED. *

the buddhists, Maro, the Angel of Death, waited upon Sakya to learn when it would be his pleasure to die. Some mahomedans assert the same of Mahomed. Azrail, the Angel of Death, entered the chamber of the sick man to announce that "he was enjoined not to interfere with the soul of God's prophet, without an entire acquiescence on his part."

In North Western India, a khetri convert from Hinduism, or any convert from Sikhism, is styled a Sheikh, and converts from inferior races are styled Moguls and Pathans.

The number of mahomedan sects is not great, as a broad distinction they are generally classed as Shi'ah and as Sunni, but the six bodies of sectarians who oppose the Sunni are classed by them as Rafiziah, Kharjah, Jabriah, Kadriah, Jahmiah and Marjah, each of whom are broken up into smaller bodies. Before the end of the first century, the ascetic turn and the theosophy inseparable therefrom, a combination styled among the Arabs Sufi, had arisen. This made rapid strides; and in the end of the third century, was already itself the subject of learned works, and the mahomedan world has carried this system to the utmost extreme. Their Sufi outstrip in every point of view both the hindu Jogi and the christian monks. The asceticism of the Sufi is more systematic, their pantheistic teaching deeper and more consistent, and their vices more enormous, than those of any other people. Spinoza and Schelling are left far behind by Ibn Arabi. But a deep metaphysical system may be found among all rude nations; for the supernaturalist has no need of learning, dreams suffice for him. Dr. Sprenger traces an essential element of early Moslem literature to the proud supremacy of Islam; and illustrates the position by the analogy of the British in India. He says:—"One must live and labour in India to know to what grand aspirations this feeling of supremacy gives birth. The heroic defence of Lucknow and the daring siege of Delhi in 1857, prove to what a pitch of greatness such influences lead. The pride of belonging to the dominant nation makes every man a hero; and, even in the domain of mind produces under such circumstances, the elements of greatness. In the days of Muavia, the finest provinces of the world, yielding a revenue of 40 millions sterling, were at the feet of the conquering mahomedans. All non-Moslems were their slaves. And it was this that moulded the heroic character of the mahomedan world. Supremacy begot assurance.—*Ferri's Journey*, p. 210,

MAHOMEDABAD. See Koh-i-nokreh.
MAHOMED ALI, nabob of the Carnatic, was recognised by the treaty of Paris as an independent sovereign. He had several brothers, Abdul Rahim; Abdul Wahab Khan and Mafuz Khan. His father, Anwar ud-din, when about seventy years old, fought and fell at the battle of Amboor, in 1749, on which Mahomed Ali fled to Trichinopoly. After the defeat of the French in the Carnatic, Mahomed Ali, succeeded to the throne, and was recognised by the treaty of Paris in 1763. From that time till his death in 1795, the Carnatic was occasionally under his rule and at times under the civil and military administration of the British. In 1795, he was succeeded by his eldest son, Oomdat-ul Umra, who died in 1801, when the British put aside Oomdat-ul Umra's son, Ali Hussain, and placed his nephew Azim-ud Dowlah on the throne. The British in 1856, on the demise of Mahomed Ghous, grandson of Azim-ud-Dowlah, finally abolished the titular nabob, from which followed long but unsuccessful efforts to seat prince Azim Jah, the second son of Azim-ud Dowla on the musnud.—*Malletson's French in India*.

MAHOMED BIN ABDALLAH, See Khalif.

MAMOMED-BIN-KASIM, a general of the caliph Walid, about A. D. 718 overran Guzerat and was advancing on Chetore when he was met by Bappa and entirely defeated.

MAHOMED SHAH, emperor of Delhi, was the son of shah Jehan and succeeded Rallia ud Dowlah. He was raised to the throne by the two brothers Abdallah and Hussain Ali; but one of these brothers subsequently fell in battle against Mahomed Shah, and the other was assassinated by his courtiers. The reign of Mahomed Shah was indolent and irresolute. He offended Nizam-ul-Mulk who invited Tamas Kuli Khan to invade India. Tamas Kuli Khan defeated Mahomed Shah, in 1739, but re-instated him on his throne receiving the cession of all the provinces west of the Indus river, Mahomed Shah afterwards ruled timorously. In 1748, he sent his son Ahmed Shah and his minister Kamrudin, against the Abdalli but his minister was slain, and in April Mahomed Shah, on hearing of the death, died of convulsions. Orme.

MAHOMED TAGHALAQ. Juna Khan, upon the death of his father, mounted

MAHRATTA GOVERNMENTS.

the throne under the name of sultan Mahommed, but he is known in history as Mahomed Taghalaq. A mad expedition in 1337 was, according to Firishtha's account, directed against China. Of the force, which both that historian and Ibn Batuta estimate at one hundred thousand horse besides infantry, scarcely any returned to tell the tale, except the few who had been left to garrison posts in rear of the army. It is difficult to guess by what point this host entered the Himalaya, nor has the town of Jiddiah at the base of the mountains, mentioned by Ibn Batuta, been identified, which would ascertain the position. He maintained an enormous royal establishment analogous to the Gobelins, or weavers in silk and gold brocade, to provide stuffs for his presents and for the ladies of the palace. He is said to have been the most elegant and most accomplished prince of his age, but full of wild schemes of aggrandisement.—*Malletson's French in India*. *Not. et Extraits*, xiii 183. *Yule Cathay II.* p. 412. MAHRATTA GOVERNMENTS IN INDIA, have been in number seven, viz.

(1). *The family of Seraji rajas* of Satarah, founded in A. D. 1644 by Shah-ji, a subhador of the Carnatic under Aurangzib, bestowing jagires on his sons, giving Tanjore to Ekojee. His son Sivaji, the founder of the Mahratta empire was born in 1627, he was rigid in matters connected with the hindu religion. When only 16 years old, he headed a band of people residents of the Mawal or ravines of the ghats, and subsequently by incessant predatory excursions largely extended his possessions. In 1664 he plundered Surat. In 1659, he treacherously stabbed Afzul Khan, a general of the Adil Shahi family at an interview. He was alternately making aggressions on the Moghul territories and making treaties with their ruler Aurangzeb, and at length, he completely routed in a pitched battle an imperial army of 40,000 men whom Aurangzeb had sent under Mahabbat Khan. On the death of the king

MAHRATTA GOVERNMENTS.

of Bejapore, in 1672, Sevaji annexed all the Concan with the exception of the English, Portuguese and Abyssinian settlements, and assumed royalty at Raighur in the 6th June 1674, and for the next 18 months he was engaged in extending his possession to the south, exacting the Choutha or quarter share of the revenues and annexing the dominions of his half brother Venkaji. He suddenly died in April 1680 at Rauree. From this time, a troubled period of usurpations occurred till 1707, when on the death of Aurungzib, Sivaji II, son of Sambha, nicknamed Shao-ji, was released and crowned at Sattarah in March 1708. His nominal successor was Ram Raja 1749, but the power rested with the Peshwa or minister, the last of whom, Baji Rao, surrendered to and was pensioned by the British in 1818. PertabSiva or Sinh was re-instated at Sattarah by the British on April 11, 1818, but he was dethroned in 1840, and sent to Benares, his brother being raised in his place, and the family became extinct with this brothers demise.

(2). *The Peshwas of Poonah*, were hereditary, and after the reign of Sivaji II, in 1749, they assumed the power of the Sattarah sovereigns in the military government established by Sivaji the first in 1669. Their open power lasted from 1740, when Balaji Bajee Rao, succeeded his father and died after the battle of Paniput, until 1818, when the next Baji Rao yielded to the British on the 3rd June and was pensioned. Nana Furuvais, Karkun of Madhaji Rao Belal, died November 1771.

(3). *The Bhonsla Rajas of Nagpur*, commenced in 1734, when Raghoji Bhonsla was nominated Sena Sahib Suba or general of the Mahratta confederacy. The family became extinct in 1865 during the administration of Lord Dalhousie, on the demise of Goozur, grandson of Raghoji, who, in 1818, had been seated on the throne when Mudaji (Appa Sahib) was deposed. Appa Sahib having succeeded Parsoji, an idiot, whom he strangled.

(4). *The Sindia family*, now the Gwalior rajahs, came from a family near Satara. The first, 1724, Ranoojee Sindia was an officer in the Peshwa's army. In 1825, Baiza Bai, widow of Dowlas Rao, adopted Jankuji, who assumed the reins of government in 1833.

(5). *The Holkar family* rose from Mulhar Rao Holkar 1724, an officer of note in the Peshwa's army, and obtained the Jaghire in Malwa in 1750. The names of this family most familiar to history are those of Ahilya Bai in the middle of the 18th century. Jeswant Rao Holkar an illegiti-

MAHRATTA GOVERNMENTS.

mate son, who (1797) maintained predatory rule, and in 1805 died insane. In 1811, his widow Tulsi Bai, adopted his illegitimate child Mulhar Rao Holkar with whom was fought the battle of Melhapur in 1818. In 1834, Martand Rao an adopted son was dispossessed by Hari Holkar, the late chief.

(6). *The Gaikwar family*, now reigning at Baroda, in Gujerat, sprung in 1720, from Dammaji Gaekwar (Shamsher Bahadoor) an officer under Khandi Rao Holkar, and they ruled till the treaty with the British Government in 1802. The Marathas are supposed to have been originally a race of mountaineers, in Baglan on the crest of the ghauts, and cultivating the fertile valleys or mawals, and the country called Maharashtra, which is first mentioned in Indian history in the Mahawanso, probably obtained its name and received a distinctive language from the existence of a Marathi dynasty at some period not recorded in history. According to Coleman (Myth p. 285) the original Mahratta state comprehended a country of great natural strength, interspersed with mountains, defiles, and fortresses. The best modern accounts he says, lead us to suppose that it included Kandeish, Baglan, and part of Berar, extending towards the north-east as far as Guzerat and the Nerbuddah river. To the west, the Mahrattas possessed the narrow but strong tract of country which borders on the Concan, and stretches parallel with the sea from near Surat to Cannara. This country is well calculated for the maintenance of defensive warfare, but that the people were not of the military caste is proved by the names of their particular tribes, the Koonbee, the Dangar, and the Goolah; or, the farmer, shepherd, and cow-herd; all rural occupations. The exteriors also, of the Rajpoot and Maharatta mark a different origin. The former is remarkable for the grace and dignity of his person, the latter, on the contrary, is of diminutive size, in general badly made, and of a mean rapacious disposition. The Maharatta brahmans, also, differ in their customs from their neighbours, with whom they will neither associate nor intermarry. Major Moor, however, says (p. 241) that the Maharattas are called Maharashtra in Sanskrit: Maha is great and illustrious, and Rashtra, synonymous with Rajaputra, implies their royal descent; and their name also indicates that they were acknowledged to belong to the second class on their arrival in India, and of course, that they were not brahmans. When these adventurers had obtained power and influence, they assumed the superior title of Maha-Rashtra; and by striking out such letters as become useless,

MAHRATTA GOVERNMENTS.

when brought to the standard of the spoken dialects, we have *Maharatta*, or *Mahratta*, similarly as we have *Surat*, from *Surasutra*; and *Gujarat*, from *Gurja-Rashtra*. They have no physical resemblance to any of the Rajput tribes. It is certainly extraordinary, that a nation so numerous as the *Mahrattas* should have remained almost wholly unnoticed in Indian history for so long a period as from the first mahomedan conquest until the reign of Aurungzebe; but it appears probable that prior to the time of *Sevajee*, the *Mahratta* country, like the other parts of the Deccan, was divided into little principalities and chiefships, many of which were dependant on the neighbouring mahomedan princes, but never completely brought under subjection. *Sevajee*, the first *Mahratta* commander, who combined the efforts of these discordant chiefs and tribes, was born in A. D. 1626, and died in 1680. His genealogy being obscure, his adherents were at liberty to invent the most illustrious, and accordingly traced his origin from the *ramahs* of *Oley-poor* (the purest of the *Khetri* caste), who claim a descent, equally fabulous, from *Nowshirwan* the just. But towards the close of the 18th century, they suddenly started on a career of conquest during which they obtained the control over a great portion of India, and established governments of shorter or longer duration at *Poonah*, *Sattarah*, *Gwalior*, *Nagpore*, *Ludore*, *Gujerat* and *Travancore*. Four-fifths of its words have been adopted from Sanscrit. That *Mahrattas* even of the highest rank have not a dignified appearance. They are hardy and active, under the European standard, and well proportioned with dark skins and irregular features and the women as a rule are not well favored. They are sturdy men, rude, rough, boorish and illiterate, but patient under labour. Their fields and gardens are kept in excellent order and they have formed good soldiers, capable of endurance, much of their tactics having resembled that of the *Parthians*, though even in this, *Lord Lake's* energy overcame them. They have all outwardly assimilated to the brahminical teachings, and have amongst them a brahminical body, who are considered to apply brahminical tenets as to caste, more stringently than any other brahmins of India; the bulk of the *Mahratta* nation however, are only of the *Sudra* caste. Their chief objects of worship are certain incarnations, or images of deified mortals, known as *Eoba* and *Kandoba*, at *Panderpoor*, *Jejuri* and *Malligaon*, but the village deities receive a large part of their attention in times of sickness or peril. Brahmins state that *Siva* became

MAHRATTA GOVERNMENTS.

incarnate in *Kandeh Rao* for the purpose of destroying an oppressive giant named *Manimal*, at a place in the Carnatic, called *Pehmer*. The giant *Manimal* made a most desperate defence against *Kandeh Rao*, but was at length slain: whereupon all the oppressed subjects of this giant paid adoration to *Kandeh Rao*, to the number, as the story goes, of seven crore of people, whence this avatara is called *Yehl-khut*: *yula* in Tamil? meaning seven, and *khut*, or *koot*, being a *Mahratta* pronunciation of (100,00,000) a hundred lakh, or ten millions. A handsome temple, dedicated to the worship of this avatara, now known as *Kandoba*, is at *Jejuri* a town of some extent about thirty miles to the south east of *Poonah*. It is situated in a beautiful country, on a high hill, and has a very commanding and majestic appearance: the temple, walls around, and steps up to it, are well built, of fine stone. The *murlidars*, or musical girls attached to it, are said to exceed two hundred in number. A great many brahmins reside in and about the temple, and many beggars. *Kandoba* is not an uncommon name with brahmins and other hindus for instance, *Lakpat Kaudhi Rao*.

The efforts of the *Mahrattas* in emancipating themselves from a foreign yoke, were neither guided nor strengthened by any distinct hope or desire. They became free, but knew not how to remain independent, and they allowed a crafty brahmin to turn their aimless aspiration to his own profit, and to found a dynasty of "Peshwas" on the achievements of unlettered *sudras*. Ambitious soldiers took a further advantage of the spirit called up by *Sevajee* but as it was not sustained by any pervading religious principle of action a few generations saw the race yield to the expiring efforts of mahomedanism, and the *Mahratta* owe their present position, as rulers, to the intervention of European strangers. The genuine *Mahratta* can scarcely be said to exist and the two hundred thousand spearmen of the eighteenth century are once more shepherds and tillers of the ground. The *Mahratta* is equally averse to the European system of warfare, and the less stiffened *Goorkha* has only had the power or the opportunity of forming battalions of footmen, unsupported by an active cavalry and a trained artillery. The attention of the *Mahratta* *sudra*, for nearly two hundred years, from the middle of the 17th up to the 19th centuries was directed solely to foreign conquest, and nearly all India from *Cape Comorin* to *Delhi* yielded the fourth part of the revenues as tribute to their kingdoms. During that period of war, agri-

MAHRATTA GOVERNMENTS.

culture cannot but have been neglected and in the early part of the present century they were characterized as mountaineers, herdsmen and soldiers, but essentially bad farmers. For the past forty years however they have been settling down to their fields, and are now, extremely well to do agriculturists, for the great bulk of them follow this pursuit, and are usually designated the Kunbi. The origin of this name is uncertain, but the first mention of it was in its application to a branch of the Mahratta people inhabiting the town and country of Lony, situated on the mountain range, about 12 miles from Poonah. In the Mahratta country, generally, Kunbi now-a-days, however, is the term, by which the cultivators are designated, and the neighbouring Canarese and Telugu races apply it similarly. The Mahrattas bordering on the Tiling and Canarese nations in the south-east are taller and better made men than those around Ahmednuggur. Speaking generally, the race is shorter, more robust and darker in complexion than the races of northern India, or even than the Tiling people, and their appearance is so dissimilar to that of the Aryan families as to preclude the belief that they have come of that stock. Even the brahminical race amongst them short, dark, and broad framed, is entirely dissimilar in physical structure from the tall fair Aryan people who form the brahminical race of the Telugu and Tamil countries. The Mahratta people have amongst them, outside every village, the pariah or dher, whom they designate as Mhar; the tanner who is called Mhang, and inside the hamlets dwell the Dhor, or carrier. There are still several petty chieftains of this race, with almost regal powers, amongst whom may be mentioned the branches at Sandoor, Gunjunderghur and a few miles from Kulladghi of the once powerful Ghorpham family. In Hindustan and Bengal the republic or village system has been greatly disturbed by the repeated inroads and conquests of foreign races and the long period of mahomedan rule and the village officers and servants are less complete. But, even there, the headman and the accountant are almost invariably retained and some of the other officers and servants are also to be found and in most instances the offices are hereditary, are capable of being mortgaged or sold: are paid by recognised fees and perquisites, by allotments of grain at the time of harvest or sometimes by portions of land held rent free or at a low quit rent.

In the Canarese and Maratta countries the village authorities are still ruling. They greatly vary in number and in duties,

MAHRATTA GOVERNMENTS.

but there are office-holders who claim to be descendants of the persons who first settled and at dates long before the oldest of the European dynasties were established. Potails are in the Mahratta country, who trace their descent from persons who settled a thousand years ago and more in the villages they now hold and the same is to be found amongst the Reddi and Ganda of the South and East, it is this that preserves the Indian villages from the changes which would otherwise have occurred from the irruptions of the Aryan, Brahmi, Jat, Persian, Tartar, Rajput, Arab, Moghul, Afghan, Portuguese, French and British. Amongst the Mahratta, office-bearers are known as Balute or Alute; amongst the Canarese, as Ayakarru, Ayagaru or Ayangandlu. The following municipal officers may be enumerated:

Head office, styled Potail, Reddi, Gauda.
 Assistant do. or Changala.
 Accountant, or Kalkarni.
 District do. or Despandi.
 Chandari, or convener of trades.
 Money-changer, assayer, gold and silversmith, or Potadar.
 Barber or Nhai or Nai.
 Washerman, Parit, Dhobi.
 Temple servant, or Gurao.
 Carpenter or Sutar.
 Potter or kumbhar.
 Gate-keeper or watchman, usually a pariah, or Mhar, Mhang, Ramusi or Bhil, called eskar, veskar, tallari.
 Waterman do. do. do.
 Astrologer or Josi.
 Shoemaker or Mhang.
 Bhat or Bard.
 Maulana or Mulla, a mahomedan priest.
 Corn meter.
 Blacksmith.
 Notary.
 Sweeper.
 Tailor.
 Physician.
 Musician.

The Mahratta village head, the potail, rents the lands to cultivators, collects the Government land tax, and forwards it to the Tahsildar. He is also the Civil Magistrate, and settles petty civil matters to the extent of two maunds of grain, or four or six rupees and sends higher claims to the tahsildar. In criminal matters he is only the Police, and sends all to the Amin. In lieu of pay for the above services, the potail is allowed from 25 to 50 bighahs of land, rent free, the land tax being about Rupees 3 or 4 the bigha. For the cultivation of his rent free lands two to four bullocks would be

MAHRATTA GOVERNMENTS.

needed because, from 10 to 16 bhigahs, according as the rains are heavy or light, are all that a pair of bullocks can get over. There are, generally, two to four potails in a village, not always of the same caste, for instance the village of Khanpur, zillah of Nandair, has four potails, two mahratta, a Canarese speaking lingaet, and a Kulkargah, and there are a few brahman and mahomedan and pariah potails, but a christian potail is unknown.

The northern limits of the Marathi language stretches on the sea coast from the Kolwan hills or country of the Kol, near the Portuguese settlement of Damian, above the ghauts in a north-easterly direction along the Satpura range, parallel to the Nerbudda, intermingling with the Gujarati, about Nandobar, in the jungly valley of the Tapti. It is spoken throughout Berar, in the open parts of the Nagpur territories; and on the whole of its eastern border it abuts on the countries and languages of the Gonds. From Nagpur, the Marathi trends to the south-west, and near the Chambasha and Si-bhasha villages of Dongopura and Murg'h to Oodghir; from thirty miles west of Beder to Sangam and Sadasheepet, it meets with the Telugu and Canarese; touching in advance nearly on Bijapur and Shankashwar, and thence trends south-westerly to the coast at Sidasheghur, skirting the western boundary of the Canarese. From Damian in the northern Konkan, Marathi runs down the coast to the neighbourhood of Goa, both below and above the coast. It there meets the Konkani, which runs nearly as far as Mangalore. And the southern limits of this mixed language is a village four miles north of Upi or Oodapi near Condapore, where Tulu or the language of Canara begins.

Konkani, the mixed Konkani tongue, however appears to be only Marathi with a large infusion of Tulu and Canarese words, the former derived from the indigenous inhabitants of Taluva of Canara; the latter, from the long subjection of this part of the Konkan to Canarese dynasties above the ghauts. Mr. H. Mogling however mentions that the Konkani speaking brahmans of Mangalore, consider it quite distinct from, though cognate with, Marathi. Its limits extend from Goa below the ghauts, to the village above mentioned north of Upi. From this part of the coast in northern Canara, a diagonal line, running in a north-eastern direction towards Beder, marks the boundary between Marathi and Canarese, of the latter at least above the ghauts.

The Guzerati language spoken in the peninsula of that name, is occupied by Rajput tribes, Gujur, Katti, Kuli and Kun-

MAHRATTA GOVERNMENTS.

bi, all claiming a distinct origin. Gujarati is bounded by the Marwadi, a little to the north of Deesa, to the north and east by the Hindi or Rangri Basha of Malcolm, in Rajputana and Malwa respectively; and in the south it dovetails with Marathi in the valleys of the Nerbudda and Tapti, ending at Hamp on the former river and running into Nandobar on the latter.

The Maratha race largely worship deified heroes. There is a celebrated idol, termed Massoba. In the Chauki, pass, in the Lakenwara range, which forms the watershed between the Godavery and the Tapti about 10 miles north of Aurungabad, there is a shrine of this deity to which from a circle of a hundred miles, people of all castes resort, brahmin, sudra and dher, but chiefly the Maharatta kunbi. The Jatra is held in the month Chaita, and lasts for four days, during which many sheep are offered in sacrifice. It is in the northern side of the pass, a mere block of stone, with smaller stones at its foot all smeared with red lead. The objects of their pilgrimage are wholly personal, beseeching the deity to give them, or preserve their, children, their flocks and their food. The Mahrata people profess brahminism: but, amongst them is a more general amount of demon, spirit, fetish, totem, shaman, and hero worship than is observed amongst the other races of the peninsula. The deities Kandoba and Hanuman, are to be seen in every village south to the Tumbadra, and blood sacrifices of sheep and fowls are largely made. Hanuman is the chief of the village gods, and is invariably smeared over with red lead, which is also applied to every bit of stone or wood that has been erected into a fetish god. There has seemed amongst them, also, a more extensive polytheism, than prevails in any other part of India, and an introduction even of the Semitic and Christian names. Between Ellichpoor and Oomraoti, the pariah races are ordinarily called Krishu, a variation of the word christian; all along the tract southwards to Oodghir the Bawa Adam, near Punderpoor, is largely worshipped, and the Jabral Abral, worshipped in east Berar, is evidently the Gabriel or Jibrail of the Semitic races. Even amongst the Kunbi race, who profess brahminism, the hindoo deities Siva and Vishnu are little heard of and with consent the editor put up for two days in the temple of the village of Assaye to which the villagers came at the usual periods to worship Hanuman and the serpent, and the officiating priest to wash and ornament its lingam. An officer of Sindiah's artillery who had fallen in the battle of Assaye had been

MAHRATTA GOVERNMENTS.

buried beneath a tree, and there the villagers continue to worship his spirit. Sicknes is usually attributed by them to the influence of a malignant spirit, and all through the Mahratta speaking districts the practice of the "Bolwan" prevails, viz., the ceremony of propitiating the Bhuta or spirits who have entered a village, inducing them to leave the village and conducting them across the borders with music and a procession. The conductors often move to the next village and thereby cause intense fear and anger, as the morbid influence is supposed to be conveyed to it. Ai, mother, equivalent to the southern Ammun, is largely worshipped in the form of a rude stone smeared with red lead, and her temples are to be seen in lone places, passes and defiles. The Mahrattas have public recitations of histories or stories of the gods, called Katha (qu. Kahta) as the Burmans have the Pui, a theatrical representation. The Gondana or Gondala of the Mahrattas is a tumultuous festival held in honour of Devi, perhaps the same as Gondhal.

Since Lord Lake's defeat of the Mahrattas near Delhi, and that by Sir Arthur Wellesly at Assaye, the power of the Mahratta chiefs gradually decreased. The privileges of Mahratta Sirdars under British rule date from the time of the reduction of the Deccan about the year 1819 in the war with the peshwa Bajee Rao. The Sirdars were high officers under the raja of Sattara and the peshwa. Their titles correspond to those of Quarter Master General, Keeper of the Records, Prime Minister, Private Counsellor, &c. Some as the Vincburkar in Ahmednuggur zillah and the nawab of Sadernur near Dharwar held such offices under Aurmzeb and other moghul emperors. A few of the lesser Sirdars were feudatories of smaller local chiefs. The grasping policy of the last peshwa, Bajee Rao, made most of them alarmed and discontented: accordingly, after the battle of Kirkee, most of them were willing to accept the liberal terms offered in the proclamations of Mountstuart Elphinstone and the other great men who reduced the different provinces. They were as a rule guaranteed the enjoyment of their ancient rights and privileges by treaties entered into by the British Government and still in force. These treaties bind them to provide a contingent of troops, to make adequate police and judicial arrangements in consultation with the Political Agents, for the extradition of criminals. They have generally exclusive civil and criminal jurisdiction in their own territories, in many cases, however, as for example in those of the first class Sirdars

MAHRATTA GOVERNMENTS.

under the Political Agent of Sattara, the treaty provides that in grave offences such as murder, the trial shall take place before the Agent. They are allowed to make their own Revenue Settlements and are not bound to give leases for a definite term as the British Government is by the Survey Act. The amount of assessment and other taxes they are entitled to collect is unlimited: this is a source of constant complaint among their ryots who envy the secure and liberal terms given by the British government. The political privileges of Sirdars are the following. By Regulation 29 of 1827 it was provided that suits against certain persons of rank should not come under the jurisdiction of the Civil Courts. Three classes of Sirdars were thereby established and three several modes of procedure defined. An Agent of Government, now styled the Agent to the Governor for Sirdars in the Deccan, was appointed to try such suits against them as would ordinarily be cognizable by the Judges of Poona or Ahmednuggur. The First Class being persons of the highest consideration under the Peshwa's Government, reference is to be had in the most ample degree to their former privileges as by usage and custom enjoyed: no decree of the Agent against a Sirdar is to be executed without the order of the Governor in Council to whom also plaintiff may appeal, a further appeal to the Queen in Council being open to either party. Suits against the second class are conducted with the same regard for former privilege and usage: the Agent is also to consider the present means of the Sirdar of discharging the debt and to apply equity. Appeal lies to the superior court of the Governor in Council but the decree may be executed against defendant by the Agent himself. The final appeal is as before to the Privy Council. Many of the Sirdars had contracted heavy debts or lost their property in the war with the Peshwa, hence the provision for considering their means in the decree. As the Agent is an Administrative as well as a Judicial Officer, he has ample means of ascertaining their circumstances. The third class of Sirdars are entitled to a similar but rather less regard being had to usage and custom. The strict rules of procedure are, if necessary, to be relaxed in their favour especially as regards decree, appeal lies to the High Court and thence to the Privy Council, but it is the practice of the Governor in Council, as a Special Court, to refer appeals for the opinion of the Judges of the High Court. The Agent for Sirdars is the Judge of Poona: he sits as Agent every Friday, both as a political and

MAHRATTA GOVERNMENTS.

judicial officer. By a later Act, the Assistant Judge is made Assistant Agent and can try original suits up to Rs. 5,000. The Sirdars of the zillah of Dharwar are exempted from the jurisdiction of the Civil Courts and subjected to that of the Political Agent of the Southern Marat'ha country whose procedure is the same as that of the agent for Sirdars in the Deccan. Formal respect is shown to Sirdars, all process sent to them is posted in a silk envelope covered with tissue, and mandates take the form of polite requests. The personal privileges of Sirdars consist in formal courtesies varied with each class. Their precedence in Durbar is exactly settled. If His Excellency the Governor invite a Sirdar of the 1st Class to attend a Durbar at Poona, the Assistant Agent has to meet him at the entrance to the city, and escort him to his house. This has to be done no matter at what time of day or night the Sirdar arrives, to meet one for instance at the Railway Station long before day-light. A Sirdar of the 1st Class is presented in Durbar by the Agent himself, the other classes by the Assistant Agent. The Sirdar on arrival is expected to pay a visit to the Agent as representing the Governor; the Agent returns this visit but the Assistant Agent may not go unless either the Agent or the Sirdar ask him. There is also an exact etiquette, varied with much nicety for each class as to the manner the Agent or his Assistant receives the Sirdar, presents him with pan-supari and attar, and invests him with garlands. The dignity of the Sirkar and respect to the Sirdar have both to be maintained in presence of beholders who regard any variation of etiquette as significant of something good or bad. They are not entitled to salutes as some rajas and nawabs are. Sirdars are also exempt from attendance in the Civil Courts and their evidence is taken by a Commission. They are of course entitled to chairs in all Courts and Sirdars of the 1st class sit on the judge's raised dais. The process of Criminal Courts in the British territories does not run in those of a Sirdar, and separate arrangements have to be made for the extradition of criminals. They stand on the footing of Foreign States under the Civil Codes, and as process does not run, witnesses in a Sirdari territory are examined by Commission. The political privileges of Sirdars are decreed by legislation; their personal privileges by orders of Government. Both originated in the conciliatory policy applied by Mountstuart Elphinstone, by Mr. Chaplain, the Commissioner of the Deccan and the other officers of the Company who settled the

MAHSEER ROHOO.

country after the fall of the Peshwa: Old natives speak of these men as "having made the Deccan bandobast." Besides Sirdars, there are other classes who hold land, by different kinds of chivalrous tenure. They are called Jagheerdars, Sarin-jamdars and Tuamdars. They may be Sirdars not included in the list of Regl. 29 of 1827. In such case, the Government is empowered to grant them sunnuds to exercise judicial functions. If the Sirdar is of the 1st or 2nd Class, the appeal lies to the Agent: if of the 3rd Class to the Zillah Judge.—*Thomas Prinsep's Antiquities*, p. 286 and 287. *Moor*, pp. 241, 424. *Cole. Myth. Hind.* pp. 189, 285. *Wilson's Glossary of Indian Terms*. See Hindoo: India; Inscriptions; Kandeh-Rao; Kattayawar; Kili-Katr; Kunbi; Lake Reddi.

MAHSEER ROHOO, or "Bastard Rohoo" is a noble carp-like fish with very large golden scales, vermilion fins and tail, and brilliant olive green coppery hued eyes. It is a mountain fish apparently a cross or hybrid between the true Malaseer and the fine Cyprinus called the "River Rohoo." In the cold season, this splendid species descends to the low country and warm rivers of the plains. In the cold season to the great rivers of the Punjab, the Sundah, rivers of Kemaon, the Raptee at Goruckpoor, the backwaters and main stream of the Upper Burrampooter. It is very widely distributed and is a quiet peaceful fish remaining in small shoals around sunken rocks, and fallen trees in deep eddying pools. It is a fish of prey; the most sport is had and the finest specimens are taken with a paste made of coarse flour and coarse sugar kneaded with ghee and a little chopped cotton; also with the ripe fruit of *Ficus Indica*. This species frequents sacred ghats and steps of temples where it obtains easy and plentiful pabulum from brahminical hands, the Pind Pooja with its concomitant balls of rice, flour offerings and ficus fruits being greatly attractive. Large specimens (up to 20 pounds) are taken about the temples at Hurdwar,—in Upper Assam, at Bagesur in the Sundah,—and in many other parts of India approaching the mountains. One of more than 40 lbs., was taken at Goruckpoor in the "Raptee"; they pull splendidly; the captor hooked it at 3 o'clock p. m., near a pool where great religious offerings are made, and the dead are burned; but it was not landed till after dusk, a lighted torch assisting the operation, the commune vulgar rather impatiently put down the unseen monster for a "Rachis" or "unclean spirit" and re-

MAHSEER ROHOO.

peatedly advised a fracture of the tackle so as to part company effectually. It was a noble specimen. The great peculiarity of this species is the unusual breadth and solidity compared to length. - He is one of the best or most profitable fish for the table—rich, firm and flaky; must be fed, and that can be done cheaply with all the berries of the ficus tribe and many other gratis products. This fish, after a short time, with all the cunning of the carp species, evades the hook; flattening the paste gradually with his nose, it is then sucked off in fragment. Always change ground from day to day for this reason, any large number of good specimens are never caught, they are so crafty and stout in their resistance when hooked.

Mahaseer, the *Megaloccephalus* of Griffiths, as its hindoo and Greek names denote, Big Head, is the striking feature of this otherwise handsome, and delicious fish. Voracious as an English pike, many a one is taken with his own species while spinning in the heavy rapids of the upper Burrampooter, the Ganges, and the Tohee river in Jumna territory. He grows to an unlimited size and I am afraid to tell you his probable weight and dimensions; let it suffice, says a writer, that I have been three times played out, knocked down, and pulled rudely about for hours, with tackle come from London, the line 256 yards costing 6 guineas, being waterproof 3 plait silk. These leviathans of the fresh water completely conquered me although in one instance I had a canoe, and changed boatmen more than once. He is a tyrant among the weaker, and will eat every fish he can swallow, but loves change of food, rising greedily at all large, and gaudy flies—natural and artificial, and will also take wild fruits, and sweet pastes, when the angler is trying for other fish, pulls and rushes very violently at first—and then moves down sulkily to the bottom, where he will remain for hours together if not opposed; swarms in all the mountain streams of India, when they retain water in the hot season; the Ganges, Jumna, and Burrampooter hold the largest; next, the great rivers of the Punjab, but this fish is often met with running to a huge size in small streams with deep pools. In the Punjab, just after the annexation, there were largely stocked ponds, pools and reservoirs called "Matchyal," abounding in kinds of fish of which this was the chief—they were considered sacred and fed daily by sound of bell or clapping of hands, and in these ponds or pools, (fed by springs), attained a fine size, but the golden haired invaders have ere this cooked most of these holy pets!

MAHVI.

The Mahaseer will certainly thrive in lakes and artificial waters, kept up by springs or subterranean streams provided only the temperature and elevation are of reasonable amount. In Nines Tal (situated in Kemaon) a very deep blue sheet of water with subterranean influx, no Mahaseer or any other fish but one lean looking lanky kind will live; and these degenerate creatures were placed there by human hands. Elevation 7 or 8000 feet above the sea. Descending about 1000 or 1500 feet to "Bheem Tal"—the said degenerate improve in appearance and size, but no Mahaseer, or anything else in its deep cold crystal. Lastly, descending to about 3 or 4000 feet elevation above the sea. Tropical vegetation abounds, and the waters even are warmer. The torrents swarm with a nursery of scaly infants of all sorts and sizes and "Mulloo Tal," a fine natural tarn surrounded on three sides by precipices, its dark surface shaded by overhanging trees, rocks and bushes, and its waters well defended by snags and projecting logs, displays in the multitude and size of its rippling circles, a swarm of scaly tenants of the higher orders, it is well and naturally stocked with the Mahaseer and its congeners, which sometimes rise well at the fly from a boat, for otherwise the tarn was unapproachable. In Cashmeer, at Islamabad, is a sacred collection of fish tanks, terraced one above another and forming a delightful succession of cascades, they are fed by a rivulet entering from a swamp behind the town, in any one of these four or five reservoirs the water is not 4 feet deep, but clear as crystal. Goolab Singh used to bestow daily 2 or 3 maunds of flour to the piscatory collection, while a writer nightly with hook and line abstracted the best fed, and best flavoured specimens of the usually coarse Hill Trout he ever tasted. Feeding decidedly improves fish as it does flesh and fowl, producing flavour and plumpness combined. The Mahaseer is a great forager, and when starving or sharp set will eat carrion. Where very plentiful they will devour even their own kind hence all the small fishes especially the "Chiliva" should be especially produced for their larder.

MAHSUL. AR. PERS. HIND. Revenue, a tax or toll.

MAHTAR, HIND scavengers, and, like the Dher, or Mhar, and Mang, generally village servants.

MAHVJ, a force was sent against the Bozdar Affghans in March 1857 through the Mahvi and Mungrota passes, and after seeing their green crops destroyed, and

MAIAUTZE.

seeing the Osterani, a small but warlike tribe, join the British, one morning the Bozdar chiefs rode into the British camp and sued for peace. They were received in solemn Durbar, and for every man they had slain in their forays 125 Rupees were paid, and 50 Rupees for every wounded man, this being the regular price of blood in the hills. A few months afterwards, they furnished a contingent to protect the frontier, when the troops were sent to quell the mutiny.—*Medley's years Campaigning*, pp. 5, 20 and 21.

MAHUL, a Nepal tree that affects the highest situations; its flowers are large and of a deep red, and yield by decoction a purplish colour, which is converted by acids into a tolerable pink. The Jumno-mandroo tree, the Gurras, the Puddiem or Payah, the Chootra-phul, the Mahal and the Puhnttoli tree, all grow in Nepal.—*Smith's Nepal*.

MAIHULA. BENG. *Bassia latifolia*.—*Willd.*

MAH-UL-LAIM. HIND. Essence of meat, used in medicine. The flesh of a young lamb being cleared of bones, fat, sinews, &c., is boiled in a moderate quantity of water, until only one-third of the water remains. This is strained and condiments added and portions distilled when needed.—*Powell, Hand Book Ec. Prod. Punjab*, p. 154.

MAHURA. HIND. *Aconitum ferox*,

MAHUR. HIND. SANS. *Ægle marmelos*.

MAHU SHUDA. SANS. *Allium sativum*.

MAHVIRA SWAMI. See Inscriptions.

MAHWA. MAR. *Bassia latifolia*.

MAHWAL. HIND. *Bauhinia vahlii*.

MAH YUH GAH. BURM. A tree of Amherst, Tavoy and Mergui, maximum girth 2½ cubits, and maximum length 18 feet. Abundant all over the Tenasserim and Martaban provinces. When seasoned it floats in water. It is used for elephant bells; but is not a durable wood.—*Captain Dance*.

MAI. See Cochin-China.

MAI. TEL. *Schleichera trijuga*, *Willd.*

MAIA. MALEAL. *Quercus infectoria*.

MAIAUTZE. Marco Polo mentions as a custom amongst several ancient tribes that in the Zur-dandan (gold teeth) tribe on the frontiers of Burmah, when a woman bore a child, she rose and went about her business and the husband took to bed for forty days, and was fed on possets. A Greek epic treats entirely on the same subject, as customary amongst a people on the Euxine,

In the Tibaronian land,

When some good woman bears her lord a babe,
'Tis he is swathed and groaning put to bed;
Whilst she arises, tends his baths and serves,
Nee possets for her husband in the straw.

Marco Polo in the thirteenth century seems to have observed the custom in the

MAIDEN HAIR.

Chinese province of west Yunnan amongst the aboriginal tribes of the land, the Miautze, who practice it to the present day. The father of the new born child, so soon as the mother can leave her couch, gets into bed and there receives the congratulations of acquaintances. About the beginning of the christian era, Strabo (iii 4,17) mentions, that among the Iberians of the north of Spain the women after the birth of a child, tended their husbands, putting them to bed, instead of going themselves. In the same locality amongst the modern Basques in Biscay, M. Michel found the same custom prevailing a few years ago. The women, he says, rise immediately after child-birth and attend to the duties of the household, while the husband goes to bed, taking the baby with him and thus receives his neighbours compliments. This practice seems to have spread to France and to have there received the name of fuire la couvade. It has been found in Navarre and on the French side of the Pyrenees. Diodorus Siculus mentions that in Corsica the wife was neglected and the husband put to bed and treated as the patient. According to Apollonius Rhodius, the same almost incredible custom prevailed among a people called the Tibareni at the mouth of the Black Sea. Amongst the Caribs of the West Indies, the father is put to bed and fed on meagre diet and his body punctured and tortured, and the Abipone husband of S. America is treated like a lying in woman—*Apoll. Rhod. Argon ii. 1012. Tylor's Early History of Mankind quoted in Quarterly Review, July 1868. Mac Muller Chips*.

MAI-BARI, also Mai-elhoti. HIND. the larger and smaller galls of *Tamarix orientalis*.

MAI-BEE. *lit.* lady mother, the priestesses of the Manipore people, deemed oracles.

MAICHANO KANRAI, PUSHTOO, a mill-stone.

MAIDA. HIND. Flour.

MAIDA. HIND. *Tetranthera Roxburghii*.

MAIDA. PERS. a cat, *Felis catus*.

MAIDAN. In India, an open plain, or the esplanade outside a city; in Western Asia it seems to be used specially for the public square or piazza, in the Italian sense, of a city.—*Yule Cathay*, I. p. 63. See Kabul.

MAIDEN HAIR, the common name of the *Adiantum Capillus Veneris*, a fern found wild in many parts of Europe, on damp shaded rocks and a favourite garden plant with the English in India. It is the *Adianton* (*Ablavros*) of the Greeks, and has probably gained its trivial name from its having

MAKER SANKRAUT.

formed a part of the preparations used by the ladies for stiffening their hair.—*Dioscorides*, l. iv. c. *Eng. Cyc.*

MAI-IN. *Burm.* *Mangifera oppositifolia*.

MAI ERIKATA. *Tel.* *Celastrus paniculata*.—*Willde.*

MAIKAL. The range of hills running south-west from Amarkantak, for a distance of some seventy miles, whence they are continued by a similar range, locally known as the Saletakri hills. The Maikal hills form the eastern scarp or outer range of the great hill system, which traverses India almost from east to west, south of the Nerbada: they do not ordinarily exceed 2,000 feet in height, but the Lophu hill, which is a detached peak belonging to this range, has an elevation of 3,500 feet.

MAIKAY. *Burm.* A species of *Murraya*? A timber tree of Amherst, Tavoy and Mergui, maximum girth 1 cubit and maximum length 15 feet. Abundant inland in Tavoy, but is scarce near Monlmein. When seasoned it floats in water. It is too scarce for helves, but recommended for handles of planes, chisels, hammers, &c. It is used by Burmese for handles of knives and other weapons, and is a strong, tough wood, in grain like Box wood. It is recommended by the Ordinance carpenters as the very best wood, in the collection, for planes or for any purpose in lieu of box.—*Captain Dence Major Simpson's Report.*

MAKER SANKRAUT is a festival at the time the sun leaves Cancer for Capricorn and which always falls either on the 12th or 13th January, Kark Sankrant is the day on which the sun again leaves Capricorn for Cancer and this festival generally occurs on or about the 15th July. Of these two the former has been regarded by all hindoos as a regular holiday; whereas the latter is confined to the brahmins and therefore less known to the lower classes of the hindoo creed. There is another festival known to all classes of hindoos held about the 31st January under the name of Ruth Saptamee, on which day according to hindoo mythology, the sun is said, to commence his travelling in a car drawn by a horse having seven heads, on this day all the bramins draw a representation of the sun riding in a chariot drawn by the seven headed horse, mentioned above, and worship it. The following hindoo holidays are regulated by the moons positions.

Voojathu.—The Telugu New Years day, is the day of the moon entering in the Kowotko and Asvaneo Stars.

MAKER SANKRAUT.

Chithra Pavovam.—In the first Tamil month, i.e., Chethra. The entering of the moon at the star Chitrah.

Garooda-seva.—In the same month, do. do. at Vesaka.

Rathavonhavum.—Do. do. and do. at Poorashada.

Aroothra.—Do. do. and do. Aroothra. **Streerama Navamy.**—In the first Telugu month Chethra. Falls after the 9th day of the new Moon. The presence of moon at Poonarvasoo or Pushamee Star.

Garooda-seva at Conjeveram.—In Malabar Vyusu and do. at Vesaka.

Rathavoochavum at Conjeveram.—In do. do. and do. at Poorvashada.

Kistna Jayanthi.—In do. Avany do. at Rohence.

Pillayar Chavithi.—Do. do. do. at Chithra.

Mahalaya Amavasya.—In Telugoo Butthapatha month, New Moon day and do. at Poobha and Wootthara Stars. On this day is performed the oblation of funeral rites, to deceased forefathers.

Anyutha Pooja or **Dasara** fest.—In Telugoo Ausavayujum d. at Buthra or Chithra.

Nava-rathri Pooja.—Begins at Sravannu and ends at Vootthashada, beginning day is Vija dasamy 10th day after the New Moon.

Deepavalee.—In Malabar Alpusee, Moons entering at Voothara or Hustha, being the 15th day from, or 11th after, the New Moon.

Deepavalee Katharo Verathum.—In do. and do. at Hustha or Chithra day of performance of Verathu.

Kartheekee - In Kartheekce month of Tamil and do. at Krithica Star.

Vykoonta Ekadase.—In Margalee 11th day after the New Moon and do. at Kerootheca or Rohence.

Ratha Saptami.—In Thyee and do. at Asvaneo 7th day after New Moon.

Ponghol Feast.—On the first of Thyee without reference to the particular Star.

Eclipse of the Moon.—There will be a moon's Eclipse when it enters at Rathoo or Rathoo Stars on the eve of the Full Moon on its turning by rotation at the 27 particular stars during 27 days in each month, joining at the completion of each turn at Asvaneo the first star.

Eclipse of the sun.—During each Malabar month the sun stays on 27 stars and when it exists at Rathoo or Rathoo on the eve hours of the New Moon day then there will be a sun's Eclipse, so it stays during 12 months at the 27 stars on coming by rotation.

The Tamil months receive their names from the Stars which the sun reaches during each particular month.

The Telugu months from the Stars at which the Moon stays on the Full Moon day:—viz.

Chithram from Chitra.	The tamil months are,
Vysakum from Vesaka.	Chithro.
Aushadum „ Poorvashada.	Vyasoo.
Justum from Justa.	Ansoo.
Sravannu from Sravana.	Andy.
Butthapathum „ Voothara.	Avany.
Buthra.	arutasee.

Karthecum from Kerootheca.	Karthaca.
	Margalee.

MAIMUNA.

Marguserum from Meroo-Thyee.
gusera. Mausee
Pushum from Pushame. Pangoony.
Makum from Makan.
Palgunum from Voothara.
Palgoona.

The 27 particular stars are named as follows:—

Asvance, Baranee, Karootheca, Roheneo, Meroogusera, Poonarvasoo, Pushame, Anslasha, Makan, Pubba, Voothara, Kustha, Chetha, Swathy, Anuvatha, Vesaki, Jasta Moola, Poorooshada, Voothane, Voothane Sravaunni, Thanista, Shathabeshumi, Poorvabuthru, Voothara do- Ravathe, Aroothira.

MAIL, also MAIL, TANG. HIND. *Pyrus kumanensis*.

MAI KIN. BURM. A tree of Moulmein. Wood used as an ordinary building material. Fruit used in medicine.—*Cat. Cal. B.* 1862.

MAILAH, the Tamil name of a tree which grows to about twelve feet high, and twelve inches in diameter. It is generally curved, and is used in boat work. It produces a fruit on which the wild pea-fowl feed; and is to be found in the forests of Malabar, and also in Ceylon.—*Edye. M. and C.*

MAILANSHI, MALEAL. *Lawsonia alba*.

MAILERU (?) KARN, a class of slaves in Kanara.

MAIL-MISSI, H. dross of melting brass.

MAIMA CHIN, see Pekin.

MAIMAN, a mahomedan sect, believed in Bombay, to be converts to mahomedanism from the Lawana, a hindu tribe of Cutch.

Khoja mahomedans, are said to be converts from the Bhatya, a hindu tribe of Cutch, the Khojah profess the sunni, but some are of the shiah persuasion.

Bohra are mostly of the shiah sect, but some follow sunnat. The sunni Bohra are sometimes called Sulamani; The shiah Bohra, is called Dawadi, their chief is styled Mulla-ji, the name of their chief in A. D. 1868 was Abdul Kader Najm ud din, who resided at Surat. The Bohra are estimated to number 100,000.

Ismaili are shiah sectarians, they take their name from the imam Ismail, son of the imam Jafar Sadaq.

MAIMUNA. Across the Moorghab, and towards Balk, which city is in the territory of the king of Bokhara, lie the small states of Audkho, Maimuna, Shibbergam, Siripool and Akehec; a connection subsists between them and Herat, but since they are divided against each other, their aid is of small avail. All of them are engaged in the slave trade, and independent, though they send presents of horses both to Herat and Bokhara, Maimuna is the most important of the whole: the

MAIN-PHAL.

chief in 1840 was Mizrah Khan, an Uzbek of the tribe Wun, and his country extended from Maimuna to the Moorghab, and adjoined that of Sher Mahomed Khan. Huzara. Maimuna itself is an open town, or rather village, of about 500 houses; but the strength of the chief consists in his "il," or moving population, who frequent Ulmur, Jankira, Sorbagh, Kaffir Killa, Khyrabad, Kusar, Chuckaktoo, Tukht-i-Khatoun, and other sites, which can scarcely be called villages. He also numbered Arabs among his subjects, many of that tribe having been long settled here. Audkho, or Audkhoe, was ruled by Shah Wale Khan, an Afghan Toork, who settled here, with others of his tribe, in the time of Nadir. They were then shiahs, but are now soonees. The "il" of the chief, besides the chief's race, were Arabs, and he could furnish 500 horse, and is on good terms with Maimuna. Audkho has a larger fixed population than Maimuna, being in one of the high roads to Bokhara, but there is a scarcity of water in this canton. It is here that the wheat is a triennial plant. Audkho is the place where Moorcroft perished. — *Papers East India Cabul and Affghanistan* p. 136.

MAIN, H. the gull on *Tamarix furax* and other species of *Tamarix*. Main-hari and Main chote are the larger and smaller galls from *Tamarix orientalis*.

MAINA. HIND. *Medicago denticulata*.

MAINA, or Sarika, the Indian grackle, *Gracula religiosa*, is about the size of a jackdaw having violet black plumage, with a naked yellow occipital band. These birds are of a lively docile disposition, and when kept in a state of confinement, imitate with great facility the various sounds within hearing, and learn to speak even with greater distinctness than most of the parrot tribe. Bontius, speaking of this bird, which he calls the Indian starling, observes, that it imitates man's voice much more accurately than a parrot, so that oftentimes it is troublesome with its prattle.—*Hind. Theat. Vol. II*, p. 277.

MAINABAN. BURM. A Tavoy wood, used for bows, lances, beams, rafters, &c.

MAINATTA MALEAL. A washerman.

MAIN-AY. BURM. Indigo.

MAING BURM. A town.

MAING-LENG-GYE. See Shan.

MAINI. HIND. *Trigonella polyserrata*.

MAINOTE the Greek word Mainote, in the ancient Albanian dialect, is of eastern origin, from maina a mountain.

MAIN-PHAL. HIND. *Randia dumentorum Lam.* also *Alourites triloba*, also *Vangueria spinosa*. The latter tree grows

MAIR.

in Marwar: the dried fruit which is used, is considered stimulating; and when given to cattle in the cold weather prevents their suffering from the cold: not given to mankind, three seers for one rupee.—*Gen. Med. Top.* p. 146.

MAINPURI, a town of the Agra district.

MAIN SABZAH H. berries of *Cupressus sempervirens*.

MAIN TOVARAI. TAM. *Cajanus Indicus*, Spreng.

MAI OH. BURM. *Calotropis gigantea* Brown.

MAI-PHAL, DUK-Galls.

MAI-PILLAI, See Maplah, Moplah.

MAIRA or Mera a kind of soil, sandy and rather inferior.

MAIR. The Mair is a branch of the Mena or Maina. The Mair is also called Mairote and Mairawut; Mera is 'a mountaineer' in Sanscrit; Mairawut and Mariote 'of or belonging to the mountain; the name of the Albanian mountaineer, Mainote, has the same signification. Mairwarra is that portion of the Aravali chain between Komulmer and Ajmere, a space of about ninety miles in length, and varying in breadth from six to twenty. The Mair are a branch of the Cheeta, an important division of the Mena, a race which consists of as many branches as their conquerors, the Rajpoots. All these wild races have the vanity to mingle their pedigree with that of their conquerors, though in doing so they stigmatize themselves. The Cheeta-Mena, accordingly, claim descent from a grandson of the last Chohan emperor of Delhi. Unail and Anoop were the sons of Lakha, the nephew of the Chohan king. The cocoa-nut was sent from Jessulmer, offering princesses of that house in marriage, but an investigation into their maternal ancestry disclosed that they were the issue of a Mena kept woman: and their birth being thus revealed, they became exiles from Ajmeer, and associates with their maternal relatives. Unail espoused the daughter of a Mena chieftain, by whom he had Cheeta, whose descendants enjoy almost a monopoly of power in Mairwarra. The sons of Cheeta, who occupied the northern frontier near Ajmer, became mahomedans about fifteen generations ago, when Doodha, the sixteenth from the founder of the race, was created Dawad Khan by the hakim of Ajmer; and as Athoon was his residence, the "Khan of Athoon" signified the chief of the Mair-ote. Athoon is still the chief town of the Mair race. Chang, Jhak, and Rajosi, are the principal towns adjoining Athoon. Anoop also took a Mena wife, by whom he had Burrar, whose descendants have continued

MAIRWARAH.

true to their original tenets. Their chief places are Burrar, Bairawara, Mundilla, &c. The Mena were always notorious for their lawless habits, and importance has been attached to them so far back as the period of Beesildeo, the celebrated prince of Ajmer, whom the bard Chand states to have reduced them to submission, making them "carry water in the streets of Ajmer." Like all mountaineers, they broke out whenever the hands of power were feeble. The Mair country is situated but a very few miles west of Ajmere, and is composed of successive ranges of huge rocky hills, the only level country being the valleys running between them. From the sturdy valour of this race, the rulers of India never made any impression on them, notwithstanding their vicinity to the occasional residence, for a long period, of the emperors of Hindustan. In later times the Mair were the terror of their lowland neighbours; and even the Rajpoots, perhaps, with the sole exception of the Rohilla, the bravest men in India, dreaded their approach. The Mair of the Mairwara hills occupy the Aravali range running towards Ajmir. Their chiefs claim to be of Rajput descent, but the Koli assert their relationship to them, and they admit having intermarried with the Bhil and Meena, and Colonel Dixon says that for hundreds of years they have been recruited by refugees and all sorts of rascals from Hindustan, and they are probably a very mixed race. They are described as rather good looking. Colonel Briggs states that the Mahrattas and Mairwara have their origin from Mair. Colonel Tod remarks we should scarcely have expected to find a mountaineer (mera) in the valley of Sind, but their Bhatti origin sufficiently accounts for the term, as Jessulmer is termed Mer. Athoon, is the chief town of the Mair or Mera race, the mountaineers of Rajpootana, and the country is styled Mairwarra, or "the region of hills."—*Tod's Rajasthan Vol. i, p. 681. Cole. Myth. Hind. p. 299. Campbell p. 45.*

MAIRASSI, Muller's name for the Papuans of New Guinea.

MAIRU. TAM. Hair.

MAI RUBIYA, a dried fish brought from Delhi: considered good in impotency; four tolas for one rupee.—*Gen. Med Top.* p. 147.

MAIRWARAH has been rescued by the British Indian Government from barbarism of the worst kind. No Native corps did more substantial service at the time of the mutiny than the Mairwara battalion. The mere fact of its having held Ajmere with an immense arsenal when the troops in Nusseerabad mutinied, was a boon to the British

MAI TAI YO.

which it would be difficult to over-estimate. Had the mutineers got possession of the arsenal with its vast stores, it would have given them a prestige which would have made it impossible for the Rajpoot princes to resist the pressure of the people to rise against the British Government. In subsequent actions they were always loyal, often very gallant. A single company on one occasion turned the whole of Tantia Topee's force when trying to pass the Aravallee. They were some years afterwards formed into a police corps. This has been felt keenly by the Mairs, who are proud of their old prowess. The district of Mairwarra, is inhabited by predatory tribes and belongs partly to Oudeypore, Jodhpore, and the British Government in virtue of its possession of Ajmere. The pergunnahs of Beawur, Jak-Shamgarh, Behar-Burkochra, and Bhacian belong to the British Government; Todgarh, Dewair, and Saroth to Oudeypore; and Changand Kot-Kurana to Jodhpore. Mharwarra was entirely subdued by a British force in 1821. With a view to the pacification and improvement of the country it was taken under British administration and a local corps was raised to which Oudeypore and Jodhpore were to contribute annually Rupees 15,000 each. Under the British Government the Mairs greatly benefited. In 1847 the British wished to take over all Mairwarra; but this was not done. Mairwarra remains in an unsatisfactory state.—*Treat. Eng. and Sumnuds Vol. IV. p. 6.*

MAISUR. Hill Station, $12^{\circ} 16' 7''$; $76^{\circ} 39' 18''$, 2 miles S. E. of the town of Maisur is 3,447 Ft. G. T. S.

The town is in L. $12^{\circ} 18'$; N. L. $76^{\circ} 39'$, 6 miles S. of the Kaveri. The Dak bungalow is 2,514 feet.—*Schl., Ad.* See Maheshwar Mysore.

MAI-SHUUT-ARABI. blood which has congealed in the belly of a young camel; after being overfed, the young camel is driven about violently, and then killed, and the blood extracted; is brought from Bombay and Delhi; supposed to benefit in impotency: one tola costs three rupees. *Gen. Med. Top. p. 147.*

MAIT OR MEYT. A small town on the African Coast, in lat. $11^{\circ} 1' 38''$ N., and long. $47^{\circ} 10' 25''$ E. It is the Tapeteye of the Periplus, and now a mart of considerable trade.—*Horsburgh.*

MAI TAI YO. BURM. A tree of Amherst, Tavoy and Mergui, of maximum girth $2\frac{1}{2}$ cubits and maximum length 22 feet. Found abundant all over the province. When seasoned it floats in water. Its wood

MAIZE.

is used for posts and many other purposes by the Burmese, and it is a particularly good wood for helves, being durable, light, and tough. *Capt. Dance.*

Mokka,	HIND.	Trigo de Turquia,	SP.
Mokka Juuri,	"		

The Zea mayz of botanists is much cultivated in India and in all the islands of the Asiatic Archipelago. It is however more reared in the western than in the old continent. In the torrid zone, maize predominates in America, rice in Asia; and both these grains in nearly equal quantity in Africa. The cause of this distribution is, without doubt, historical, for Asia is the native country of rice, and America of maize. In some situations, especially in the neighbourhood of the tropics, wheat is also met with, but always subordinate to these other kinds of grain. Besides rice and maize there are in the torrid zone several kinds of grain as well as other plants which supply the inhabitants with food, either used along with them or entirely occupying their place. Such are, in both continents, Yams (*Dioscorea alata*), the Manihot (*Jatropha manihot*), and the Batatas (*Convolvulus batatas*), the root of which and the fruit of the Pisang (*Musa paradisiaca*.) furnish common articles of food; in the same zone in Africa, are Doura (*Sorghum*), Pisang, Manihot, Yams, and *Arachis hypogaea*; in the East Indies and in the Indian Islands, *Eleusine coracana*, *E. stricta*, *Panicum frumentaceum*, several Palms, and *Cycadaceae* which produce the Sago, Pisang, Yams, Batatas, and the Bread-Fruit (*Artocarpus incisa*). In the islands of the South Sea, grain of every kind disappears, its place being supplied by the bread-fruit tree, the pisang, and *Tacca pinnatifida*. In the tropical parts of Australia there is no agriculture, the inhabitants living on the produce of the sago, of various palms, and some species of Arum. "In the high lands of South America, there is a distribution similar to that of the degrees of latitude. Maize indeed grows to the height of 7200

MAIZE.

feet above the level of the sea, but only predominates between 3000 and 6000 feet of elevation. Below 3000 feet it is associated with the plantain and the above mentioned vegetables, while from 6000 to 9260 feet the European grains abound: wheat in the lower regions, rye and barley in the higher, along with which *Chenopodium quinoa* as a nutritious plant must also be enumerated. Potatoes alone are cultivated from 9260 to 12,300 feet. To the south of the tropic of Capricorn, wherever agriculture is practised, considerable resemblance with the northern temperate zone may be observed. In the Southern parts of Brazil, in Buenos Ayres in Chili, at the Cape of Good Hope and in the temperate zone of Australia, wheat predominates; barley, however, and rye make their appearance in the southernmost parts of these countries, and in Van Diemen's Land. In New Zealand the culture of wheat is said to have been tried with success, but the inhabitants avail themselves of the *Acrostichum forestum* as the main article of sustenance. Hence it appears that in respect of the predominating kinds of grain, the earth may be divided into five grand divisions, or kingdoms—the kingdom of rice, of maize, of wheat, or rye, and lastly of barley and oats. The first three are the most extensive; the maize has the greatest range of temperature, but rice may be said to support the greatest number of the human race."

Its composition is as follows:

	Per cent.		Per cent.
Moisture . . .	12.90	Mineral constituent	
Nitrogenous matter	9.23	(ash) . . .	1.86
Starchy matter .	71.63		
Fatty or oily matter	1.59	Total...	100.00

The growers on the hills of Nepal reckon three kinds of maize: a white grained species, which is generally grown in the low and hot valleys; and a smaller one, called "Bhoteah," or "Marilli Moki," which is considered the sweetest of the three, but from being less productive is not generally grown on good lands. Maize thrives best on a siliceous, well-drained, rich soil. The finest Indian corn of the Sikkim range, is grown where the soil consists of a substratum of decomposed mica from the under or rocky stratum, with a superstratum of from three to six inches of decayed vegetable matter, from leaves, &c., of the ancient forests. Throughout Hindostan, June is the usual time for sowing. In Behar, about two seers are usually sown upon a beegah; in Nepal, twenty-four seers upon an English acre; in the vicinity of Poonah, one and a-half seer per beegah. Before the seed is sown the

MAIZE.

land is usually ploughed two or three times, and no further attention given to the crop than two hoeings. In Nepal, where it is the principal crop cultivated, the seed is sown, after one delving and pulverisation of the soil, in the latter end of May and early part of June, the seeds being laid at intervals of seven or eight inches in the drills, and the drills an equal space apart. The drills are not raised as for turnip sowing, but consist merely of rows of the plant on a level surface. The seed is distributed in this manner with the view of facilitating the weeding of the crop, not for the purpose of earthing up the roots, which seems unnecessary. Indian corn sowing resembles that of the *gohya* (or upland) rice, in the careful manner in which it is performed; the sower depositing each grain in its place, having first dibbled a hole for it five or six inches deep, with a small hand hoe, with which he also covers up the grain. The after-culture of this crop is performed with great care in the valleys, but much neglected in the hills especially on new and strong lands. In the former it undergoes repeated weeding during the first month of its growth, the earth being loosened round the roots, at each weeding, with the hand hoe. After the first loosening of the soil, which is performed as soon as the plants are fairly above ground, a top dressing of ashes or other manure is given. By this mode the crop gets the immediate benefit of the manure, which otherwise, from the extraordinary rapidity of its growth, could not be obtained by it. In three months from the time of sowing, the seed is ripe. The crop is harvested by cutting off the heads. In Nepal these are either heaped on a rude scaffolding near the cultivator's house, or, more commonly, they are suspended from the branches of the trees close by, where, exposed to wind and weather, the hard and tough sheath of the seed cones preserves the grain for many months uninjured. Cattle are voraciously fond of the leaves and stems, which are very sweet, and even of the dry straw, which Dr. Buchanan surmises may be the reason why it is not more generally cultivated by the natives as the difficulty would be great to preserve the crop. It is said that near Kaliyachak, though the people give all other straw to their cattle, yet they burn that of maize as unfit for fodder. In Nepal, the stalks, with the leaves attached, often twelve feet long, cut by the sickle, are used as fodder for elephants, bedding for cattle, and as fuel. The maize crop within the hills of Nepal suffers much from the inroads of bears, which are very numerous

MAJNUN.

in these regions, and extremely partial to this grain. The average return from this crop is seldom below fifty seers, ranging frequently far above it. In the peninsula of India, it is nowhere used for diet food but like fruit, as a luxury, roasted, maize is increasing in cultivation in Java, and some of the Eastern islands. It is found to have the advantage there over mountain rice, of being more fruitful and hardy, and does not suffer from cold until the mean temperature falls to 45 deg. of Fahrenheit, and no heat is injurious to it. Several varieties of it are known, but for all practical purposes these resolve themselves into two kinds: one, a small grain, requiring five months to ripen, and a larger one, which takes seven to mature. In some provinces of Java it yields a return of 400 or 500 fold. Mr. Crawford found, from repeated trials, that in the soil of Maturam, in Java, an acre of land, which afforded a double crop, produced of the smaller grain 848½ lbs. annually.—*Simmonds, Commercial Products*, p. 283. *Schow in Jameson's Philosophical Journal*. *Simmons's "Colonial Magazine,"* vol. ii. p. 309. *Transactions of Agri-Hort. Society of Calcutta,* vol. iv. p. 125. *Crawford's Dictionary*.

MAIZE, a river of Boondee runs near Dooblana in Kotah.

MAIZURRY? *Chamærops Ritchiana*.

MAJACHICHA, See Wijao.

MAJA KANI, MALAY. Galls.

MAJIGA, TEL. Butter-milk.

MAJITH, HIND. *Rubia munjista*, madder, also *R. cordifolia*.

MAJMAL-UT-TUARIKH, an Arabic work, descriptive of the early Arab invasions on Sind. It is by an unknown author and is an abridgment of universal history up to the 6th century of the Hijira, it was commenced in the reign of Sanjar of the Saljuki A. D. 1126, (A. H. 520) but he must have died an old man as he notices an event of A. D. 1193.

MAJNI, HIND. *Pluchia, sp.*—.

MAJNUN, II. *Salix babylonica*, weeping willow, also, Persian, a lunatic.

MAJNUN.

Majoon, HIND. SANS. | Majoon, TURK. an electuary or compound generally an intoxicating electuary formed of ganjah leaves (*Canabis sativa*), milk, ghee poppy seed, flowers of the thorn apple or *Datura*, the powder of the *Nux vomica*, and sugar, sometimes also cloves; nutmegs; mace; saffron and sugar candy. It is used by the mahomedans and hindus, particularly the more dissolute, who take it to intoxicate and ease pain.—*Faulkner*.

MA-KLEU.

MAJOON, TURK. Opium.

MAJORUM, GER. Marjoram.

MAJU, HIND. *Quercus incana*, *Quercus infectoria*.

MAJUPHAL, HIND. Oak galls, galls of *Quercus infectoria*, *Q. incana*; also the berries of the cypress, *Cupressus sempervirens*.

MAJURI, HIND. *Coriaria nepalensis*.

MAK, also MAK'KA, HIND. *Zea mays*.

MAKADE CHETTOO, TEL. *Schrebera Swietenoides*.

MAKAI, HIND. &c. a fibre.

MAKAI, HIND. *Citrullus colocynthis*, *Schrad.* also, *Trichosanthes palmata*, *Roxb* also *Modecca trilobata* also *Populus balsamifera*.

MAKAN, HIND. a house, a burial place.

MAKANDAR, the proprietor of a burial place.

MAKANDAMA. SANS. or MAMIDI, TEL. *Mangifera Indica*.

MAKAND BABRI, HIND. *Ajuga, sp.*

MAKANI, was the title of Akbars.

MAKARA, the god of love. Kama, who bears on his banner the fish Makara, an aquatic monster something like the sign of the zodiac Capricornus.—*Hind. Theat.* Vol. ii. p. 84.

MAK'L. PERS. *B'dellium*.

MAKLAM. SIAM. *Abrus precatorius*. L.

MA-KLEU. BURM. *Diospyros mollis*.

MAKWA.

MAKLEUA. The berry of a large forest tree at Bangkok, said to be the *Diospyros mollis*, which is used most extensively by the Siamese as a vegetable black dye. It is merely bruised in water, when a fermentation takes place, and the article to be dyed is steeped in the liquid and then spread out in the sun to dry. The berry, when fresh, is of a fine green color, but after being gathered for two or three days it becomes quite black and shrivelled like pepper. It must be used fresh and whilst its mixture with water produces fermentation.

MAKO,

Puddun.	HIND.	Gurkhi	HIND.
<i>Solanum nigrum</i> ,		<i>Solanum rubrum</i> .	

The dried black and red berries are indiscriminately sold as medicine, are also eaten fresh by the poor; the leaves are given in flatulency, and are eaten as a vegetable in dropsical swelling of the hands and feet: are also pounded with ginger to rub the hands and feet, do not seem to be poisonous in India.---*Gen. Med. Trop.* p. 145.

MAKOK a Siamese plant, producing a sharp acid fruit, after eating which, if water be drunk, a sweet taste is left in the mouth and palate, which remains for a whole day.

MA-KOIT, SIAM. *Feronia elephantum*.

MAKOL, HIND. Granular gypsum.

MAKRAN, a province to the East of the Persian empire, and by the Greeks called *Gedrosia*, or *Gadrosia*, on the borders of Sind; Cape Monz terminates a range of mountains that the boundary between Persia and India --*Onseley's Travels Vol. I, p. 149.* See Kej.

MAKWARPUR. See India.

MAL. AR. Wealth. Mal-Dar. Wealthy; Mal-Guzari. Revenue.

MAL. HIND. *Populus alba*, white poplar, or abile.

MAL also Bledgerme. FR. Malt.

MALA, also Malavadu. TEL. the Chuckler race. BENG. A pariah.

MALA. *Bryonia laciniosa*.

MALA. HIND. A necklace, a garland, a rosary. The tulasi or rudraon has the same estimation amongst the hindus that the musketoo had amongst the ancient Britons, and was always worn in battle as a charm, --*Tod's Rajasthan Vol. I.* p. 619.

MALABAR. A Madras collectorate running for 100 miles on the western part of the peninsula, between the mountains and the sea. It has many rivers and marine lagoons. Its name is obtained directly from the Portuguese "Malavares" but the people call themselves Malleallar from "Mala" a mountain and "alam" a district or country. Malabar is 138 miles long, 25 broad in the northern and 70 in the southern half and contains 6,262 square miles. It is divided into 17 talooks or districts and has a population of 1,602,914 souls, of whom 1,165,174 are hindus, 414,126 moplabs and 23,614 christians. Malabar is the garden of peninsular India. Here nature is clad in her brightest and most inviting robes; the scenery is magnificent; the fields and gardens speak of plenty; and the dwellings of the people are substantial and comfortable. The term Malabar as usually applied by older geographers, designates the whole of the narrow belt of country rarely above fifty miles broad, west of the great Peninsular chain, from Goa to Cape Comorin: it thus includes the British district of Malabar, besides Cannara and Kurg to the north of it, and the kingdoms of Cochin and Travancore to the south. This tract is in general hilly and mountainous; a narrow strip of low land borders the sea, frequently intersected by long sinuous salt water creeks, and covered with cocoa-nut trees; the hills which are thrown off as spurs from the main axis often reach the sea and dip suddenly into it; they enclose well cultivated valleys, and though generally low to the west, they rapidly rise to the east, where they join the chain. The climate of Malabar is characterized by extreme humidity, and an abundant rain-fall during the south-west monsoon, when the temperature seldom rises above 75° the mean of the year being 81°. Malabar was over-run by Hyder Ali, and made tributary to Mysore, but after the war of 1791-2 the

MALABAR.

treaty of 1792 transferred it to the British. The rain-fall is on the average 120 inches. Malabar has many hindus following the rule of descent e matrice, also many mahomedan Moplahs, active intelligent men, engaged in commerce. The *Charumar* are predial slaves whose name Wilson derives from "Chera" Malayalam, the soil; they follow the rule of Maruma-ka-tayam. They are very diminutive with a very black complexion and not unfrequently woolly hair. The *Makkaran* is a fisherman caste of Malabar also called Makawa and their women Makate. The toddy drawer of Malabar is called Katti Karan. The *Ashary*, in Malabar, is the carpenter caste. In common with the brass founder, gold and iron smiths, they continue the practice of polyandry, but in civil inheritance follow from father to son, and not the old Italian practice of maternal descent, descensus ab utero. The elder brother marries and the wife is common to all the brothers. If a junior wish to marry he must live apart and set up business apart, but if any of his younger brothers reside with him, his wife is common to them. The *Panni Malayan* are a servile caste of Malabar. The *Adiyan* of Malabar is a slave, serf or vassal who lives under the protection of a *rajah* or religious establishment. The *Malayan* of Malabar, seem to be the same as the *Palayan*. The *Nair* are the ruling race of Malabar, they profess to be *sadras*. They were formerly accustomed to duelling. The practice was called *Ankam* and hired champions were often substituted. The *Palachi* is a forest tribe in Malabar, who are deemed so unclean that they are not allowed to approach other castes. The *Uradi* or *Urati* of Malabar are a servile race. The *Tigra* race in Malabar are toddy drawers and agriculturists. The *Pulayan* or *Pulian* of Malabar is a servile caste, often slaves, this is doubtless the Pullar. *Ch'ra* was a small ancient state, between the territory of the Pandya and the western sea. It comprehended Travancore, part of Malabar, and Coimbatour. It is mentioned in Ptolemy, and may have existed at the commencement of the Christian era. It spread, at one time, over the greater part of Carnata, but was subverted in the tenth century, and its lands partitioned among the surrounding states.

Gold is largely washed out of the sands of the Arliporanboor river, a feeder of the Todakul river; of the Arankunum river disemboguing at Caraloudy; at the Beypore river, gold is found in the beds of the several branches of this river which flow through the Nelamboor valley, before they all unite above Mambaat Angaddy. The Carampoya or Carambye river rises like the Ponapoya,

MALABAR.

with which it unites at Poolliumpara in Wynaad, and their united stream is then called Pamdy-paya, but this, on approaching the ghauts, again divides into two streams and the main branch called in the Nelamboor valley, the Caramboe, rushes down the Alliumpullly cheram. The Pooloowye and the Iroopoonjay rivers in Calicut talook and the Goodernapoya river, a feeder of the Beypore river all contain gold.

Caracoorpoya river, descends from Devalla to the right of the road through the Carcoor pass to join the Poonapoya river. Gold is also found in the Camballa Nullay, one of the Chulamally range close under Nellialum, and in many other places, at Kutchambara on the bank of the Goodoora Poya river, in the bed of the Killakumpoya river, which rushes down from the Wynaad into the Nelamboor valley to join the Poonapoya river. The matrix of the gold ore is supposed to be in the mountains and hills of Malabar, and even many elevated spots in the valleys of Nelamboor and Mookoorty, and immediate vicinity of Devalla and the Koondah and Neilgherry mountains whilst that which is found in the beds of rivers and other mountain streams seems to be brought down by the monsoon rains. The mines of the Nelamboor valley are here innumerable: the principal, however, are in the thickest part of the jungle immediately under the Wynaad Hills and near the villages belonging to the Teeroopad. The sands on the sea beach between Parparangaddy, Caraloudy and Beypore contain gold.

The Poonapoya or Golden river, rises in the Parul Mallah N. E. of Mookoorty, forming part of the main chain of the Neilgherries. The Poonapoya descends the mountains between Alliam Pullay and the Carcoor Cheram and long before its formation with the Carrumbye, it receives both the Kellakumpoya and Caracoopoya the sea beach between Parparangady in the Shernaad talook to Caraloudy and thence to Beypore.

Teeroowalay or Teermoulay is a hill near Mambaat Angady, about 150 feet above the level of the Beypore river. In the Teeroowanibady division of Polwye, north of the Beypore river is a mountain stream which, descending the ghauts to the left of the road through the Tamboorcherry pass, runs through the Tamboorcherry and Palwye districts and forms a junction with the great Beypore river between Manroor and Sherwaddu, and opposite to Mapooram, in the Ernaad Talook.

In Wynaad, above the ghauts, gold is found in Parkmeetil, a higher table land, between Manantody and Nambolkacotta, at a place called Chollyode in Nonnaad and Nellialum

MALABAR NIGHT-SHADE.

and Ponany in Moopeyanaad, it is likewise found at Devalla and its immediate vicinity in Nambollacotta. Along the Malabar coast, at every seaport town, cocoanut day, is one of the great feasts. It occurs in August, and is supposed to mark the termination of the S.W. Monsoon, the date when the navigation of the sea is open, and when the hindoo trader may very safely trust his ships and goods to the ocean. At Bombay, the natives clad in their holiday attire, go in procession from their houses in the town to the seashore, preceded by bands of music. On the beach, numerous ceremonies are performed over a cocoanut, generally covered with gold and silver leaf, which is then cast into the sea as an offering by the principal person present. Every trader or boat-owner there makes a similar offering on his own account. Many of the lower classes of natives swim or wade in, to fish out the cocoanuts; and as during the scramble, some of them often receive severe knocks from the cocoanuts, which are thrown in by persons in the crowd, there is generally a good deal of laughter, noise and excitement. The first boat of the season generally puts to sea directly after, gaily decorated with streamers. In former days, the chief civil functionary at the E. I. Company's factories, at such places as Tanna, Surat, and Broach, used to attend and sometimes cast in the first cocoanut; but this practice was long since stopped by orders from the Court of Directors, and no servant of Government is now allowed to take any part in any such ceremony.—*Madras Lit. Journ. Elphinstone's History of India*, p. 414. *Chow Chow*, p. 290. See India, Jains, Jews, Kerala, Kummaler, Laccadives, Marco Polo, Musiris, Nicolo-di-Conti, Polyandry, Riu, Scholastikos, Sri-sampradaya, Teer.

MALABAR BRAHMAN is the chief priest at Kedarnath.

MALABAR HEMP. Eng. *Crotalaria juncea*.

MALABAR HILL. With the exception of Malabar and Worlee Hills, on the western, and Chinchpooogly hills on the eastern shore, the land in Bombay is very flat, and a very large area is still below the level of the sea at high water and is annually flooded during the rainy season.

MALABAR NIGHT-SHADE. *Basella rubra*.

MALABATHRUM.

MALABAR NUT, fruit of *Adhatoda vasica*, syn. of *Justicia adhatoda*.

MALABAR POINT, in Bombay, here, are the ruins of a very ancient black stone temple, and many fragments strewn about with a variety of images sculptured on them. Below the point among the rocks, there is a cleft well known to the natives, and esteemed very sacred. Here the believing hindu, obtains regeneration or a second birth. He comes to the spot and deposits all his clothing, then passing through the aperture he is supposed to be born again, and ablution in the tank and gifts to the priests completes the washing away of his sins. *Chow Chow*, page 60 and 61. See Yoni.

MALABAR SAGO-PALM. Eng. *Caryota urens*.—*Linn.*

MALABATHRI TAMALAPATHRI, leaves of *Cinnamomum tamala*.

MALABATHRUM, a name which occurs frequently among the writings of the ancients, and which was applied to a leaf imported from India, whence it was likewise called *φάλλον Ἰνδικόν*, and also simply *Folium*. It was employed by them both as a medicine and as a perfume. From it there was prepared both an oil and a wine by maceration of the leaves in these menstrua. Many fabulous statements accompany the earliest accounts, as that of Dioscorides, by whom it is stated that by some they are thought to be the leaves of the Indian Nand; that they are moreover found floating on Indian marshes, and that they grow without roots (lib. i. c. 11), and that (lib. ii. c. 10) it is by feeding on them that the animal affording the *Onychia* or *Unguis Odoratus* of the ancients, becomes aromatic. In the works of the Arabs, *Saduj* is given as the synonyme of *Malabathrum*; and *Saduj*, both in Persian works and in India, is applied to *Tej-Pat*, or *Tej-bal*, or the leaf of the *Tej*, which is a species of *Cinnamomum*, *C. albiflorum*, growing in the dense forests of the valleys of the Himalaya, which extend from Rungpore to the Deyra Doon in 30° N. lat. Dr. Hamilton found the same name applied to a very nearly allied species, the *C. tamala*. Both species, as also *C. aromaticum*, most probably yield the leaves which were so highly esteemed in ancient times, and are still as extensively employed in eastern countries, and may be found in every Indian bazaar under the names of *Tej*, or *Tej-Pat*, or *Tej-bal* or by the Arabic name of *Saduj-Hind*. They are analogous in all respects to bay-leaves produced by the *Laurus nobilis*, and are in fact the bay-leaves of India. The name *Malabathrum* no doubt is derived from *Tamala-patra*, or

MALACCA.

Tamala-leaf, as was first indicated by Garcias:—"Appellatur autem Indi folium Tamalapatra quam vocem Græci et Latini imitantes corrupte Malabathrum nuncuparunt." These are brought from the interior of almost inaccessible forests, and necessarily stripped from the branches for the facility of carriage; hence, most probably, originated the fables with which their early accounts are accompanied. Some of the early writers after the Portuguese discoveries took the pan or betel leaf for the malabathrum of the ancients, but the physician Garcias da Horta, in his work on the aromatics of India (first published at Goa in 1563), pointed out that malabathrum was the Tamalapatra, the leaf of a species of cassia.—*O'Shaughnessy Beng. Dispens. Eng. Cyc. Yule Cathay* I p. cxlv. *Powell*, p. 302.

MALACA MALAY. *Embolica officinalis Gaertn.*

MALACCA. Except Goa, Malacca was the earliest European settlement in the east. The province, at one time the great emporium of trade from the innumerable islands of the Indian Archipelago, has seen many changes since it was wrested from Mahomed Shah by the Portuguese in 1511. After remaining in quiet possession of Portugal for 130 years, it fell into the hands of the Dutch, who held it for 74 years, when the British took possession and their first act was, at an expense of two lacs and sixty thousand Rupees, to demolish the Fort, erected at a vast cost by the Portuguese and much improved by the Dutch. In 1818 Malacca was again ceded to the Dutch, who finally exchanged it with the British for Bencoolen and other settlements in Sumatra; in 1825 the British by treaty with the Dutch agreed to hold no possessions in the Archipelago, south of the Equator, and the Dutch, vice versa, north of the Equator. The approach to Malacca from Penang cannot be excelled in picturesque beauty. On one side the steamer skims along the Malay coast, the treble peaked mount Ophir 4,000 feet high and other high-lands are in the distance; on the other she passes through a chain of beautiful Isles, wooded to the water's edge so low, that they appear like masses of verdant bushes growing out of the ocean. Malacca occupies a crescentic Bay. A street of substantial two storied houses faces the sea, forming one horn of the crescent, erected from the debris of the old Fort by the ruler over the settlement at the time, as a private speculation. A river navigable for small boats for twenty miles runs down the centre of the crescent and on the right bank the native

MALACCA.

town is built. To the left of the first line of houses is the remains of the fort gateway decorated with the Portuguese and Dutch arms—and on the summit of a conical hill rising behind the houses, is the ruined church of St. Marie, in which are tomb stones from the year 1595 downwards, and the remains of the citadel which formed the centre of the Fort, the British turned the old church into a powder magazine. Malacca is the favorite resting place for the Straits Chinese. So soon as they have made a little money they retire to lay their bones there. Many of them speak English fluently and in commercial dealings they are running a close race with the merchants from civilized Europe. With their own ships they carry the produce from the islands around either for barter or for sale at Singapore, or for shipment to England and they are as liberal in their commercial transactions as they are bountiful in their charities.

The town of Malacca is situated on the Malay peninsula, at the mouth of a small river flowing into the Straits of Malacca, in long. 102° 12' east, lat. 2° 14' north. and the Malacca province on the western sea-board of the Malayan peninsula, has a sea frontage of 43 miles. Malacca derives its name, according to Malay history, from the Malacca tree. In 1517, the salvation of this city from the Acheinese was ascribed to the sudden appearance of Saint Francis Xavier, the apostle of India, who was then on his pilgrimage through the East, and had recently made 600 or 700 converts among the pearl fishers of Manaar. At the period of his arrival, Malacca was threatened by a formidable invasion from the opposite island of Sumatra which was delayed though not abandoned.

Malacca alone, of the three Straits stations has a name in history; it being not improbable as is thought, that it is the eastern extremity of what was known as Ophir to the ancient Hebrews, or Sophir to the authors of the Septuagint version, whither the fleets of Hiram and Solomon voyaged on their trading expeditions. In various parts of the First Book of Kings are notices of the productions of Ophir. 'And they came to Ophir, and fetched from thence gold, four hundred and twenty talents.' 'And the navy also of Hiram, that brought gold from Ophir, brought in from Ophir great plenty of alung trees, and precious stones.' 'Once in three years came the navy of Tarshish, bringing gold and silver, ivory, and apes, and peacocks.' The learned dispute as to the situation of Ophir. Some

MALACCA.

contend that the Eastern part of Africa now called Zauquebar and Mozambique, where there is a region called Fura, producing gold, was the Ophir or the Tarshish of the East. Spain being that of the West. Others believe that the district of Oman in Eastern Arabia, where is a place called Al Ophir, is meant; and others say that India and Ceylon are to be understood. But although it is said, that the Queen of Sheba (the present country of the Habshi or Abyssinians and the southern parts of Arabia) came to see Solomon with great stores of gold, precious stones, and spices, it is nowhere said that these, at least the gold and precious stones were the productions of Sheba. As Sheba lay contiguous to the gold regions of Africa and not far from India, it does not seem at all improbable that she obtained these precious articles by trade with those countries. A production peculiar to the Archipelago is the camphor tree *Dryobalanops camphora*, one of the most gigantic and lofty of the great trees of the forests, which so densely clothe these islands. The trunk often rises 120 feet before it branches out, with a girth a few feet above the ground of 25 feet. A single trunk would form a most magnificent pillar or column. The timber is so plentiful, that 'terraces' or 'highways' being made of it appears nothing improbable; it is also valuable, being fragrant and lasting. An extensive trade has always been carried on in it. The word 'almug' etymologically leads to the idea of the wood having the appearance of coral, and 'algun' may show that the wood was either resinous, or produced some resin. The timber of the camphor tree is resinous in quality, produces the most valuable camphor known, and has a fresh, pale red tinge much resembling that of the common coral. Here, then, in the camphor tree, we may find the qualities and appearance of the 'almug' or 'algun tree.' Camphor is not strictly speaking, a resin; it is rather a solid volatile oil. Josephus expressly says that the Aurea Chersonesus was the Ophir of Solomon's time. Kini Ballu (the Chinese widow) is the name of the highest mountain in Borneo. Within the limits of the British province of Malacca are several productive mines of tin and gold, which are worked by thousands of Chinese and Malay miners. But the principal mines of both gold and tin exist in and about Mount Ophir. The depth of the gold mines is from 70 to 200 feet, and the process of pounding the rock and washing the gold dust is simple and rude. The tin is worked from lowlands at the depth of a few feet, and some of the ores are so rich,

MALACCA FORT.

that they contain about 80 per cent. of the metal. The whole Malayan Peninsula, from Perak and Queda (Kedah) on the North to the islands of Carimon and Banca, which were once probably connected with the main land, in the South, is one rich deposit of tin. The population of the whole province is about 80,000 that of the town being a third of the above number. Of the town population not many are Malays, they are chiefly to be found in the country; but there are about 12,000 Chinese, 5,000 Kling, 3,000 Christians (Dutch and Portuguese,) 1,000 Bengali (chiefly convicts and their descendants,) and about 1,000 of the various races of the Archipelago and Arabs.—*Newbold, British Settlements* Vol. i. p. 108. 1 *Hough, Christianity in India*, ii. iii. 188; *Abbe du Bois*, 3 *St. John's Indian Archipelago* Vol. i. p. 162. *Cat. Rev.* No. 73 Sept. 1861 p. 49-57 *Low's Sarawak*. See Jakun, Johore, Leedes, Koenig, Marco Polo, Monsoon, Kedah, Pulopisang, *Phyllanthus emblica*.

MALACCA BEAN. Eng. fruit of *Anacardium occidentale*. Marking Nut. See Balazar.

MALACCA CANE the Heo-tau of Cochin-China, is the long internodes of the *Calamus seipionum* of Loureiro, of which a thousand reach Liverpool annually, to form walking sticks. The late Dr. Griffith believed these canes to be produced from the *Calamus seipionum*, the Heo-tau of Cochin-China. They do not occur about Malacca, but are imported from Sink, on the opposite coast of Sumatra. Some of them are simply mottled or clouded, others of a brown colour, in consequence, it is said, of their having been smoked. The most slender specimens, with the longest internodes, are the most valued.—*Seeman*.

MALACCA CINNAMON. See Cinnamon.

MALACCA CIVET. Eng. Syn. of *Viverricula Malaccensis*.

MALACCA FORT, or the Church on the hill, is in lat. 2° 18' N., long. 102° 15' E. The country a few miles inland, is formed of undulating hills, moderately elevated, called Malacca Hills, and 7½ leagues E. by N. ½ N. From it rises the high mountain Goonong Lodang, called also Queen Mount also Mount Ophir, about 7,000 feet high. In the entrance of the Strait of Malacca, near the Nicobar and Acheen Islands and betwixt them and Junk Ceylon, there are often very strong ripplings, particularly in the S. W. Monsoon. There is no perceptible current, yet the surface of the water is impelled forward by some cause. They are seen in calm weather approaching from a distance

MALACOPTERYGII ABDOMINALES.

and in the night their noise is heard from a considerable distance before they are near, alarming to persons unacquainted with them, for the broken water makes a great noise when the vessel is passing through it. They beat against a ship with great violence, and pass on, the spray coming on deck, and a small boat could not always resist the turbulence of these remarkable ripplings.—*Horsburgh*.

MALACHIA, (?) H. A class of thieves and dishonest persons in Bengal, now apparently extinct.—*Beng. Rev.* 22, 1793.

MALACHITE. The mines of Siberia, at Niehne Tagilsk have afforded great quantities of this ore. A mass partly disclosed measured at top 9 feet by 18 feet; and the portion uncovered contained at least half a million pounds of pure malachite. Other noted localities are Chessy in France, Sand-lodge in Shetland, Schwartz in the Tyrol, Cornwall, Australia, and the island of Cuba. This mineral receives a high polish, and is used for inlaid work, and also ear-rings, snuff-boxes, and various ornamental articles. It is not much prized in jewellery. Very large masses are occasionally obtained in Russia, which are worked into slabs for tables, mantel pieces, and vases, which are of exquisite beauty, owing to the delicate shadings and radiations of colour. In the Great Exhibition of 1851 there were magnificent specimens of this material in the shape of doors and vases sent thither by the Emperor of Russia. At Versailles there is a room furnished entirely with tables, chairs, &c., wrought in malachite, and the same are to be found in other European palaces. At Niehne Tagilsk, a block of malachite was obtained weighing 40 tons. Malachite is sometimes passed off in jewellery as turquoise, though easily distinguished by its shade of colour and much inferior hardness. It is a valuable copper ore when abundant, but it is seldom melted alone, because the metal is liable to escape with the liberated volatile ingredient, carbonic acid. In India it is rarely worn as a gem and only by Europeans. It occurs abundantly in the copper mines in Australia.—*Eng. Cyc.* p. 134.

MALLAPURAM.

MALLAPURAM. The city of the great Malla. According to the Mackenzie MSS, Malla is the patronymic title of a northern tribe of mountain chiefs, who sprang from the aboriginal inhabitants, and who were non-Aryan. The Khond, it appears now call themselves Mallaru. According to the inscription near the Varahsvami temple, it was also known as Janouathapnra, a name possibly indicating Jaina ascendancy. The idea of Dr. Babington is that the place was first procured by the brahmins as an Agrahara, and that they employed stone-masons at their own cost from time to time to ornament the rocks with the excavations and sculptures which we now find. Brahmins apply the legend of Mahabali to Malla, the king of Mallapuram and identify the one with the other. According to the legend, Mahabali was a rajah, living in the treta-yuga, who by penance and austerity had obtained possession of the whole universe, including heaven, earth and hell, so that he was a universal monarch. He became so elated by his greatness, that he omitted to perform the customary religious ceremonies to the gods. Vishnoo, in order to check the influence of so bad an example, became incarnate in the person of a wretched looking brahmin dwarf, and in this form appearing before Mahabali asked as a boon as much of his wide possessions as he could pace in three steps. This the king readily granted, upon which the dwarf grew larger, and continued to expand till he filled the whole universe, thus depriving the insolent monarch of all his possessions except hell, which he was allowed to keep. This legend probably represents the victory of hindoos of the vaishnava sect over some powerful non-Aryan king. But the application of it to the king of Mamallapuram naturally leads us to conclude that there must have been some similarity between him and the asura Mahabali.

The shore temple is so close to the sea that the surf in the calmest weather dashes against the door way. This and the usual stone pillar in front of such temples lying in the sea, as well as fragments of images, large quantities of stone, and broken bricks lying about, some partially buried in the sea, plainly show that at one time buildings existed to the east-ward which have been destroyed and overwhelmed by the sea. The situation of this temple, therefore, and the remains of ruins towards the sea, plainly indicate an encroachment of the sea, and traces of a large city destroyed by the sea are confirmed by tradition. Besides the tradition it is stated in the catalogue of the

MALARIA.

Mackenzie MSS. that the whole coast from Mailapur, or St. Thome, down to Mamallapuram was overflowed by the sea, and that many towns were destroyed, and this tradition is confirmed by the appearance of a ruined city about two miles north of Mamallapuram. That there has been a great convulsion of nature is proved by the unfinished state of the temples, and the great rent in one of the largest ratha. These celebrated rock sculptures at Mavalivaram, are commonly known to Europeans as the "Seven Pagodas" but the sculptures cannot be older than the 13th century of our era. The mythology of the figures is Aryan, chiefly taken from the Mahabharata, and the language of some of the inscriptions is Sanscrit, which plainly proves the predominant influence of the brahminical priesthood. The Rev. W. Taylor states, it is beyond doubt that before the time of Kulattunga Cholen, and his illegitimate son Adondai (about A. D. 1200) the whole district bounded on the north by the Pennar, on the south by the Palar, on the east by the sea, and on the west by the ghats, was dwelt in by half-civilized people termed Kurnubar, who had embraced the Jaina religion, brought to them from the north. Allowing, then, a period of 100 years for the brahmins to eradicate Jainism and establish their authority, the date of the oldest temples, the rathas, cannot be placed earlier than the 13th century, of the christian era. Some of the sculptures are probably much later. The good state of preservation in which they are, and the freshness of the workman's chisel observable here and there, as well as the legibility of the inscriptions, all tend to show that they cannot be very old. Mavalivaram in ancient times seems to have been a large city, the capital of a kingdom, and the seat of the ruling sovereign. In the Sthalapurana, written in Sanscrit, the name is simply Mallapuri. But in the inscription near the Varahsvami temple, it is enlarged into Mahamallapuram by pre-fixing the Sanscrit adjective Maha. Mallapuri means the city of Malla.

MALARIA. It has been remarked along the Mahavelliganga, a few miles from Kandy that during the deadly season, after the subsidence of the rains, the jungle fever generally attacks one face of the hills through which it winds, leaving the opposite entirely exempted, as if the poisonous vapour, being carried by the current of air, affected only those aspects against which it directly impinged. The most malarious part of India, is the Therai near the Himalayas.

MALATI.

MALATAFAT, Ab. Attenuentia.

MALATI and **MADHAVA** is the title of a hindu drama, in which the social life of the race is largely represented. Malati puts on her bridal dress in presence of the deity. It was customary also amongst the Greeks for the intended bride to pay her adoration to some deity before her marriage, usually to Diana; but at Athens no virgin was allowed to be married before worshipping Minerva, who, was the tutelary deity of the city. Madhava's passion is described as

Heard, felt, and seen, possesses every thought,
Malati alone, fills every sense, and pants in every vein.

The passion of Malati is equally intense with that of Juliet; but her unconquerable reserve, even to the extent of denying her utterance to him she loves more than life, is a curious picture of the restraint to which the manners of hindu women were subjected even whilst they were in enjoyment, as appears from the drama, of considerable personal freedom. Megasthenes tells us that the Indians of his time did not communicate their metaphysical doctrines to women, thinking that, if their wives understood their doctrines and learned to be indifferent to pleasure and pain, and to consider life and death as the same, they would no longer continue to be the slaves of others. We find from the later ceremonial sutras (Srauta and Grihya sutra) that women were not allowed to learn the sacred songs of the Vedas, the knowledge of which constituted one of the principal acquirements of a brahman before he was admitted to the performance of the sacrifices. *Mann*, ix and 18 says "women have no business with the text of the Vedas, thus is the law fully settled; having therefore no evidence of law, and no knowledge of expiatory texts, sinful women must be as foul as falsehood itself and this is a fixed rule." The practice of the wife worshipping the husband is very ancient. In the drama styled *Ratna vali* or the necklace, Vasavadatta, after worshipping the image of the deity, her attendant says

"The worship of the divinity concluded, be pleased madam to pay adoration to your lord.

Vasava. Where are the flowers and nugent?

Kanch. Here madam.

On which Vasavadatta worships the king. This is conformable to the Bhavishyottara Purana, which directs, "Having offered adoration to the mind-born divinity, let the wife worship her husband, with ornaments, flowers, and raiment. Thinking internally with entire complacency, 'this is the god of

MALAY KONJI MARAM. Tam. *Colleen excelsa*.

MALAY men average 5 ft. 3 in. high. They are far more gallant than the natives of other parts of the east and those they love, they also respect. Their dress is the baju or jacket, generally white; the sluar, short trousers, and sarong, or petticoat, with the saputangan or coloured handkerchief round the head. The women are generally fairer than the men, with soft lustrous eyes, and long drooping lashes. They use the sarong falling from under the arms, and the kabia a long loose robe open in front and falling from one of the shoulders, to within one or two inches of the ground.

The Malays were not originally coerced into mahomedanism, nor have instances of violent conversion, such as the recent one of many of the Batta by the padris in Sumatra, been frequent in later times. The Arabs and other mahomedan missionaries conciliated the natives of the country, acquired their

MALAYALAM.

language, followed their manners, intermarried with them, and, melting into the mass of the people, did not, on the one hand, give rise to a privileged race, nor on the other to a degraded caste. Their superiority of intelligence and civilization was employed only for the instruction and conversion of a people, the current of whose religious opinions was ready to be directed into any channel into which it was skillfully diverted. They were merchants as well as the Europeans, but never dreamt of having recourse to the iniquitous measure of plundering the people of the produce of their soil and industry. This was the cause which led to the success of the mahomedans, and it was naturally the very opposite course which led to the defeat of the christians. The Europeans in the Indian Archipelago have been just what the Turks have been in Europe, and the consequences of the policy pursued by both may fairly be quoted as parallel cases."—*Crawford's History of the Indian Archipelago* Vol. ii. p. 275 B. D. p. 276 J. I. A. No. v. May 1848. See India.

MALAYALAM, or Malayarima is spoken along the Malabar Coast on the western side of the Ghats or Malaya range of mountains from the vicinity of Mangalore where it supersedes the Canarese and the Tulu, to Trivandrum, where it begins to be superseded by the Tamil. The people speaking it in the states of Travancore and Cochin, and in the provinces of Malabar and Canara, are estimated by Dr. Caldwell at two and a half millions. The language, however, on the Malabar Coast, is rapidly being driven out by the Tamil. The people who speak it are of all the Dravidian races, the most exclusive and superstitious and shrink with most sensitiveness from contact with foreigners, though their coast, more than any part of India, has been in all ages visited by the traders of other lands, by Phœnicians, Greeks, Jews, Syrian Christians, and Arabs, and the three last even formed permanent settlements amongst them. Their retired character has led to the less scrupulous and more adroit Tamilian people occupying all the lines of communication and monopolizing the greater part of the public business and commerce of the Malabar states. In a short time, perhaps, the Malayalam will only be known in the hilly tracts or jungle fastnesses. Malayalam was separated from the Tamil before the latter was cultivated and refined, and, from brahminical influence, has since had an infusion of Sanscrit words more than in any other Dravidian language, the fewest of such being in the Tamil. In all the southern languages, save the Malayalam, the pronoun is

MALAYALAM.

post-fixed in a contracted form to the verb. Some of the post-fixes are also made honorific by slight euphonic changes. The Malayalam is spoken by about 2½ millions, and the Tulu, on the sea-border somewhat to the north, by about 100,000 or 150,000. All along the southern portion of the West Coast, a large part of the population is to a great degree of foreign blood. The Mappila in N. Malabar write Malayalam with the Arabic character but with additional vowel marks for e, o, and i, and some of the consonants have additional dots. In S. Malabar they use the old Tamil character called *வெழுத்து* *vattazhuttu*. The origin of the Mappila is explained by the fact that till lately Tyatti or women of the Tiya race did not lose caste by forming connections with rich and respectable foreigners. Since two or three have risen in the Government service to position (one was a Deputy Collector) they have put a stop to this practice. The Mappila race have several times risen in insurrection seemingly from agrarian grievances. Hindu landlords kept the land in their own hands or leased it out to the Mappila at high rents and then took advantage of legal rights to turn them out. The derivation of Mappila seems uncertain because it is written Mappila and not Mappallai or Mappilla, it may be a corruption of some Arabic participle? The 'Hill Kings' called in Malayalam *Male-ansar*, are hill tribes inhabiting the Southern Ghats. They speak corrupt Malayalam in the northern part of the range, where the Malayalam is the prevailing language, and corrupt Tamil in the southern, in the vicinity of Tamil speaking districts. The term Malabar is evidently derived from Malayala or Malayam, meaning the hill country. Some writers indicate its origin as from the Arabic word *Ma'abr*, meaning the place of crossing over, but it is dangerous to quit India for derivations of Indian words. The Malayalam language is spoken in the low country and along the western ghats from Cape Comorin to the Chandagiri river. The people occupying that tract are mostly settled but it has had several dynastic races, the Zamorin of Calicut, the Bibi of Cannanore, the rajah of Cochin, the rajah of Travancore, the Dutch have held sway there, and the present paramount power is the British. Adjoining the Malayalam district on the north, is the S. Canara district, in part of which, around Mangalore, the Tulu language is spoken, Canarase being the tongue in general use. In this tract, the Nair race occupy large holdings, the rajah of Travancore is a Nair, and there are many of the

MALAYALAM.

mahomedans styled Mopla or Mappilah. In South Malabar, descent to sons is the law, but in North Malabar, the Nair, the artisans, carpenter, brass-smith, black-smith, gold-smith, the Tiyar, who are toddy drawers, and the Mookwa who are fishermen, are all polyandrists and descent of property goes in the female line. In North Malabar this law of descent is called Marumakatayam, and the mahomedan Mopla has conformed to this usage. In Canara, a similar law called Alya-Santana, or nephew inheritance prevails, and is in practice more strictly carried out than in North Malabar. In North Malabar, the adherents to Marumakatayam form united family communities termed Tarvaad. The senior member of whatsoever branch is the head of the family and is termed Karnaven; the other members are styled Anandraven. The remotest member is acknowledged as one of the family and entitled to maintenance if living under subordination to the head of the family and taking part in their religious observances; for the women there is nothing analogous to the state of widowhood as existing elsewhere,—whether, in alliance with men or not, they reside in their own families. The Nair marries before he is ten years of age, but though he supports, he never associates with his wife, who receives at her pleasure, any men, provided they be not of lower birth. Consequent on this form of descent, a Nair does not know who his father is. In law, property is held to vest in the females only: practically the males are co-sharers with the females. In default of males, females succeed to the management of the family property. In some families, the management devolves on them preferably to the males and the senior female takes it. There is, however, a growing tendency to convey property from father to son, arising from the gradual abandonment of polyandristism. The connubial connection in question is called in Malabar “goona-dosham,” —“goona,” good, “Dosham,” evil (for better for worse) In Travancore, it is styled “mundu-vanga,” viz: mundu, cloth “vanga” receiving, where the girl taken is of ripe age and her consent must be obtained. Personal acquaintance thus precedes the union. The hour selected is 8 P.M.; there is an assemblage of friends; the man presents the woman with a “munda” or white muslin cloth, in a corner of which in North Malabar, a small sum of money is tied. The girl either goes to the man’s house, or remains in her own and is visited by him there. Each party is unrestricted as to the number of such connections that may be formed, but these ordinarily do not exceed two or three. The

MALAY TANGHI VAYR.

descent being in the female line, the parentage of the father is immaterial. The marumakatayam law is not followed in North Malabar by the Aka-Podwal, a class of pagoda servants, nor by the brahmins of North Malabar or of Canara, but in Travancore law, only the eldest brother of a brahmin’s family is allowed to marry with his equal, and the other brothers form other connexions. In the Tuluva country, the brahmin widow can devote herself to the temple, and reside outside or inside its walls. If within the walls, she is a servant of the idol and receives the visits of men of her own caste only: the offspring of such, if boys, are called Moylar, and the girls are married to them. But if she elect to reside outside the wall she must pay a monthly sum to the pagoda and may cohabit with any man of pure descent. The Mopla, written also Mappilai, possibly derived from the Tamil words ma, mother, pillai, a son, are all mahomedans, and are descendants of Arabs who visited or settled in Malabar, and Wilson supposes that the Malabar women who bore children to them, from such casual or permanent intercourse, ignorant as to who of the race of foreigners were the fathers, styled the children sons of mothers, but the probability is that the law of descensus ab utero, marumakatayam followed by the mothers was prevailing from prior ages. The Mopla are all large men, active, enterprising and possess much landed property. They have been restless under British rule, and have repeatedly risen in insurrections but these have been local, and seem to have been from agrarian grievances the result of the British being unacquainted with their proprietary rights in the lands—*Journal of the Indian Archipelago* No. iv. and v. April and May 185, p. 216. See Dravidian, India, Kerala, Kummalar, Mopla, Nair.

MALAYAN. The designation of a caste of slaves in Kanara and Malabar.

MALAYANESIA. Instead of the name Indian Archipelago which is too long to admit of being used in an adjective or in an ethnographical form, Mr. Earl at first suggested the term Indu-nesia but rejected it also in favour of Malayanesia. The purely geographical term Indonesia, is suggested by Mr. Logan as a short synonym for the Indian Islands or the Indian Archipelago, as we thus get Indonesian for Indian Archipelagian or Archipelagic, and Indonesians for Indian Archipelagians or Indian Islanders.

MALAY TANGHI VAYR. Tam. root of *Sida lanceolata*.

MALDIVÉ ISLANDS.

MALAY TAYNGA. Tam. *Sterculia foetida*.

MALAY TOVARAI. Tam. *Cajanus Indica*.

MALAYA LAND. See India.

MALBAH? village expenses.

MALBHOJ? a name given by the Bhot race to a fine rice of Assam.

MAL BURUTE, SINGH. flowered satin-wood; *Buruta, Chloroxylon swietenia*.—*Roxb.*

MALCHANG. Hind. *Salix alba*.

MALCOLM, Sir John, K. C. B., an officer of the Madras Army. He went as ambassador to Persia, was employed with the army against Baji Row, peshwa, in the last Maharatta war, and afterwards was governor of Bombay. He was an active, able man, with much energy and great bon-homme. He greatly aided Colonel Kirkpatrick in the dispersion of the trained French armies of the Hyderabad Government. He accompanied the Hyderabad armies when they advanced to aid in the siege of Seringapatam. After the battle of Assaye, at which he was not present, he was Resident at Mysore. He died in July 1833 in London. He wrote a history of Persia; History of Central India; Life of Clive.

MALCOM, HOWARD. An American missionary and traveller, who published a history of his travels in Ava.

MALDA, a district and station town of Bengal, the station 191 miles from Calcutta. It is a small district N. W. of Rajshye. The ruins of Gour, the ancient capital of Bengal, are in this district.

MALDEO, died S. 1671 (A. D. 1615), he had twelve sons. His death formed an important epoch in the annals of the Rahtor race. Up to this period, the will had waited upon the wish of the gallant descendants of Siva; but now, the banner of the empire floated over the 'panchranga', the five coloured flag, which had led the Rahtor from victory to victory, and had waved from the sand-hills of Amerkot to the salt-lake of Sambhur; from the desert bordering the Garah to the peaks of the Aravalli. Henceforward, the Rahtor princes were required to maintain a contingent of their proud vassals, headed by the heir, to serve at the Mogul's pleasure.—*Tod's Rajasthan, Vol. II. p. 30.*

MALDEVA. See Malwa.

MALDIVE ISLANDS. A vast group of islands in the Indian Ocean, estimated at twelve hundred; extending southward from lat. 7° 6½' N., to 0° 42' S. The islands are formed into large groups which the natives call Atoll or Atollon. Of these there are

MALE.

nineteen, and they appear to be the summits of coral mountains. The inhabitants are mahomedans, governed by a sultan or king, and engage in trade and navigation. The Maldivo and Lakkadive islands have the Arabic alphabet, but their language is Singhalese. The group extend 466 geographical miles in length and 46 or 48 miles in breadth. Between the islands the water is of great depth but on the surrounding reefs the waves beat with great violence. The reefs have openings which admit ships to enter, and though the water inside the atolls, is generally shallow and calm, the depth is sufficient to allow vessels to pass from one side to another. The number of the islands is supposed by the natives to be 1,200; but it is generally believed that there are much more numerous. Mali the largest island in L. 4° 10' N. and L. 73-40 E., is 7 miles in circumference and contains about 2,000 people. There are four safe channels through the islands. The soil is sandy, all the islands are densely clothed with palms, fig trees, bread fruit trees and a thick jungle covers them all. Indian corn, sugarcane and millet are grown in a few. There are no sheep or goats, but there are a few cattle and the inhabitants live chiefly on fish and cocoanuts. They trade with India, carrying, in boats, cocoanuts, couries, salt-fish, coconut oil, coir, jaggery, coral, ornamental mats, tortoise shell and cowries, and import grain, cotton, silk and tobacco. The population of the latter group is estimated at 1,50,000 to 200,000. They are all mahomedans, who do not conceal their women. They are governed by a ruler, who is styled Sultan of the thirteen Atolls and twelve thousand Isles but who is tributary to the British Government of Ceylon. The people are quiet and inoffensive and little accustomed to war. The larger islands produce edible roots, fruits, and poultry and they traffic with Sumatra. The bread fruit, coconut and fish are the chief food of the people.—*Memoir by Lieuts. J. A. Young and W. Christopher, I. N., in Bombay Geog. Trans. 1836-1838; and in Bombay re-print vol. i. 54. Huey, Brit.*

MALDODA, HIND. *Leucas cephalotis*.

MALDUNG, HIND. *Ulmus erosa*.

MALDY. A fabric made at Maldah, of a mixture of silk and cotton, very durable and which washes well. It is exported through Sikkim to the North West provinces and Tibet.—*Hooker Vol. II p. 251.*

MALE, HIND. *Panicum antidotale*.

MALE of Cosmas is a region of Malabar.

MALE. The Rajmahal hills form a kind of knot, at the extreme eastern point of the hill

MALE.

country of Central India, dividing Bengal from Behar and the Rajmahal people are known as Male. They are to the east of the Oraon, but are entirely different from their neighbours the Sonthal. They are better looking than the Sonthal. The skin is dark, face broad, eye small, and lips thicker than those of the men of the plains. Their language abounds in terms common to the Tamil and Telugu, and contains so many Dravidian roots of primary importance, though it also contains a large admixture of roots and forms belonging to the Kol dialects, that Dr. Caldwell considers it had originally belonged to the Dravidian family of languages. A brief vocabulary of the words of the tribe inhabiting the Rajmahal hills in Central India, is contained in Vol. V. of the Asiatic Researches and Mr. Hodgson's more complete collections prove the idiom of this tribe to be in the main Dravidian. Test words show an identity of language among the Rajmahali on the east, and the Maria in the remote jungles down to the Godavery, and the Gond who live along the Satpura as far west as Nimar and Malwa. It is akin to that of the Oraon. Latham says Bodo is one of their gods, and is the same as the Batho of the Boda, the Potlang of the Kuki and Buddha, and their priesthood like that of the Bodo consists of Devian and Devasi. It was the Male race, amongst whom Mr. Cleveland so successfully laboured to impart to them settled habits. They have been successfully reclaimed, are quiet cultivators and formed the bulk of the corps known as the Bhagulpore hill ranges. Ghatwall estates are particularly numerous in the Bhagalpur and Bherbham districts adjoining the Rajmahal hills on either side. The estates pay no revenue, but are held on the condition of guarding the passes against hill robbers, murderers and cattle-lifters. The Sonthal and Male or Rajmahali are regarded by Mr. Logan as a displaced portion of the prior inhabitants of the country. The Male and Kol tribes are supposed by him to resemble the coarser Binua tribes of the Malay peninsula, more than the Burman the Malay, or other Indonesian tribes. But the same type as the Male and Kol are found amongst Malayas and Burmans, although generally softened, and the short and turned up nose are Binua, as also is the small stature and the vertical, turned up head. The Male or Rajmahali are described as mostly very low in stature, but stout and well proportioned. There are many less than 4 feet 10 inches and perhaps more under 5 feet 3 than above that standard, but 5 feet 3 inches is about the average height of the men. Their nose

MALE.

is flat and their lips thick, though less so than the Kafir of Africa, but their lips are thicker than those of the populations of the neighbouring plains. Buchanan Hamilton says that the features and complexion resemble those of all the rude tribes whom he had seen on the hills from the Ganges to Malabar. Their noses are seldom arched and are rather thick at the points, owing to their nostrils being circular, Bishop Heber says that the Male nose is rather turned up than flattish, but they are not so diminutive as the noses of the Tartar nations, nor flattened like those of the African negro. Their faces are oval and not shaped like a lozenge, as those of the Chinese are. Their lips are full, but not at all like those of the negro; on the contrary their mouths in general are very well formed. Their eyes, instead of being hid in fat and placed obliquely like those of the Chinese, are exactly like those of the Europeans. Their women, though hard worked are far from having harsh features. Bishop Heber says that the Malay or Chinese character of their features is lost, in a great degree, on close inspection. The Male head like that of the Kol has more of an elongated oval than that of a lozenge shape. The forehead is not narrow and the lateral projection of the zygomatic is comparatively small. Nothing is said respecting the shape of the back of the head, a very important point in comparing Turanian tribes. The Male, or hill man is described by Captain Sherwill as much shorter than the Sonthal and of a much slighter make. He is beardless or nearly so, is not of such a cheerful disposition nor is he so industrious. In the mountains S. W. of Calcutta, are the Dhanga, Oraon, the Kol, the Larka Kol or Ho, and the Khond.

The Ho are a comparatively small tribe. Their country proper is the part of the Singbhum district, called Colehan, a series of fair and fertile plains studded with hills. It is about 60 miles from N. to S. and from 35 to 60 in breadth, and has, to the South and S. E., the tributary estates Mohurbhum, Keonjur, Bonai and Gangpur, inhabited by Uryah speaking hindus: to the east and north the Bengali pergunnah of Dhalbhum and district of Manbhum; and to the N. and N. E. the Hindi district of Lohar lagga.

For the Male or Rajmahali, the most eastern dialect, and those which it might have been supposed, were longest in contact with the east Gangotic, we have vocabularies by Major Roberts (A. R. iv. 127) and by Mr. Hurder (in Mr. Hodgson's series, J. A. S. XVIII, 553.) The Oraon vocabulary of

MALE.

Colonel Ousely (Hodgson's series) has so much resemblance to the Male that it may safely be set down as a dialect of the same language. It frequently agrees with the Male where it differs from the co-dialects, with which it is now in contact in Chota Nagpur. This may be considered as confirming the tradition of the Uraon that their original country was Rotas and parts of Rewa, or the hills along the northern bank of the Sone (to the southward of Benares). According to the tradition, they were driven across the Sone by the intrusion of Gangetic hindus into their native land, and ultimately settled in Chota Nagpur, the country of the Kol tribe of Munda or Ho. At a latter period hindus pushed into this territory, reduced the more civilized Uraon to slavery drove the wilder Kol into revolt, and eventually forced them to migrate to the southward and eastward into the land of the Bhuian. The more northerly of the eastern emigrants passed out into the low country, and mixing with the Bhumij and Bhuian natives, formed the class of Tamaria. The more southerly moved into Singbhum, and Kolehan, living at peace with the Bhuian pre-occupants until the intrusion of Hindus from Marwar, who first leagued with the Bhuian against the Kol and then with the Kol against the Bhuian, and finally appropriated Singbhum leaving Kolehan or Ho-desam to the Kol or Ho, as this southern tribe call themselves. Remnants of the Kol are still found to the northward nearer Chota Nagpur, and they appear to be also spread to the northward towards Rajmahal. One tribe, the Sonthal, is found in Chota Nagpur and in the skirts and vallies of the Rajmahal hills. It is enumerated by Mr. Stirling in his list of the Kol tribes of Cuttack, and according to Captain W. S. Sherwill its range is from Cuttack through Chota Nagpur to Rewa, thus embracing the territory of both divisions of the eastern Vindhyan. The Raen, Male, and some others, are not inferior to the Jat in fierceness and sobriety, although they are inferior in enterprise and resolution.

The Male and Uraon languages are mainly Dravidian, and it is remarkable that although the Male are now confined to the N. E. extremity of the Vindhya, where the Ganges washes and bends round the chain, and are separated from the South Dravidian nations by the Kol race, their language is more Dravidian than the Kol itself. The pronouns and numerals, for instance, are Dravidian, while those of the Kol are Gangetic, Himalayan and Ultra Indian. The explanation is probably to be found in the cir-

MALEGAON.

cumstance of the Uraon and Male having, originally, formed an uninterrupted continuation of the Gond tribes and dialects that extended from the Godavery to the N. E. extremity of the Vindhya. The Kol, again, must have formerly had a greater extension either on the north, breaking through the Male Gondian band, into the Gangetic valley, or on the south to the seaboard of Cuttack and the lower valley of the Ganges, where they would be exposed to the influence of maritime visitors and settlers, Ultra Indian and Gangetic. But as both the Kol and the Male-Uraon are physically Ultra Indian more than Dravidian, and the occupation of the Eastern Vindhya and the hills on the opposite side of the Gangetic valley by Ultra Indians implies that the valley itself was at one time possessed by the same race, the simplest conclusion is that the Kol were an extension of the ancient Ultra Indo-Dravidian population of the Lower Ganges and the highlands on its eastern margin. The peculiarities of Kol, when compared with the S. Dravidian, and the Male-Gondian or purer north Dravidian dialects, are chiefly glossarial.—*Journal of the Indian Archipelago* No. IV. and V. April and May 1853 pages from 196 to 198. Tickell J. A. S. 1849 pp. 694-7. Mr. Logan in J. L. Arch. Latham Campbell, p. 25 to 33.

MALE, See Tsan-pe-na-go.

MALE ARASAR, or hill kings, are small tribes of mountaineers on the hills in the extreme south of the Peninsula. They inhabit the range of ghats between Tinnevely and Travancore, in small communities of five or six families and probably do not exceed 500 in all. Their huts consist of a few sticks covered with bark and thatch. They live on wild forest products, but, since A. D. 1850, they have been cultivating potatoes for their own family use. They have a few fowls and dogs. As a race they are diminutive and pot-bellied, their crania small, and pear shaped, rising to a point about the junction of the occipital bone and the sagittal suture; a low retreating forehead, long, tangled, black hair, flat nose, and small eyes. They are averse to intercourse with strangers. They catch wild animals with pits and traps and use bows and arrows. They are a miserable body, low in the scale of civilization.

MALEBATHURUM, drug from the west coast of India.—*Tennant's Hindustan* Vol. I. p. 133.

MAHD KHAR a natron salt obtained from the saline waters of the Loonar lake.

MALEGAON, in L. 20° 38'; N. L. 74° 35', E. in the Dekhan, on an affluent of the

MAL.

Girna. The mean height of the village is 1,587 feet.—*Wills. Schlag.*

MALEGAWA, a budhist temple at Kandy, contains the Delada or reputed tooth of Buddha.

MALEI AVAREI. TAM. Inga xylocarpa.

MALEIR KOTLAH a Cis Sutlej state has 165 sq. miles, with a population of 46,200 souls and a revenue of one lakh. The family came originally from Kabool.

MALEK. In the first periods of mahomedanism, four Arabian doctors, Malek, Ambel, Hanifee, and Shafee, made commentaries on the original text of the Koran, which were adopted by sects, now severally distinguished by the names of the commentators. But these explanations did not militate with much force, against the first system, nor create any violent feuds, among the different sectaries. The mahomedans have now as many sects as the christians.—*Chetfield's Hindoostan*, p. 206.

MALEK. ARAB. a king.

MALE MANGOSTEEN. ENG. fruit of *Garcinia purpurea*.—*Roxb.*

MALEO or the *Megacephalon rubripes*, deposits its eggs in the loose sand of the sea beach, in holes just above high-water mark; the female lays one large egg, which she covers over and returns to the forest; but many birds lay in the same hole. A dozen eggs are often found together. One egg fills an ordinary teacup, from 4 to 4½ inches long, and 2½ to 2¾ wide. They are very good to eat, and much sought after. The hen-bird takes no further care of the eggs, which the young bird breaks through about the 13th day, and runs at once to the forest. Each hen lays six or eight eggs in a season of two or three months.

MALETENGI. TAM. *Sida acuta*, BURM.

MALEVARA, a tribe of hill men in the Nagar district of Mysore, said to be the aboriginal landholders.

MALEVELAN MALEAL. A tribe of mountaineers.

MALGEEN. See Khyber, p. 518.

MALGUZAR. In India, the person responsible to government for the payment of the revenues assessed on a village. *Malguzari*, revenues.

MALI. HIND. A gardener. The gardener race are a very large body of agriculturists, generally engaged in the finer branches of their profession. They are particularly numerous in the Dowlatabad province, extending into Ahmedunggur and Poonah, southwards to Sholapoor, and in Berar they are 153,220 in number. They are cultivators and sell vegetables, fruits, and flowers. In the Ma-

MAL KANGI KANNI.

ratha country the Mali is distinguished by the article he chiefly cultivates, as Jiri-Mali, grower of cummin and other aromatic seeds, Phulmali, grower of flowers, &c.—*Wilson.*

MAL OCCHIO. ITAL. Evil Eye.

MALOK. HIND. Kaghan, &c. corruption for amlok.

MALONI BAPCAI, seed of a small plant found about Ajmeer; tasteless; has a fine scent: is of a warm nature, a dram is given in medicine: used externally with other medicines to cure the itch.—*Med. Top. of Ajmeer*, p. 127.

MALOO. HIND. *Bauhinia vahlii*, W. and A.

MALOPE. A genus of very beautiful annual plants, of the Malvaceæ, grown readily from seed at the commencement of the rains, the colour of flowers purple, and violet, the plant grows to the height of seven or eight feet and is better adapted for a shrubby than the flower garden. *M. grandiflora*, is a plant of India, which yields fibres.—*Riddell*.

MALJHUN. HIND.

Mawal,	BENG Maloo,	HIND.
Patwa,	"	

This is the *Bauhinia racemosa*. Along the forests of the Sewalik and the hot valleys of the Himalayas, from the doos of the North-West to the valley of Assam, may be seen this magnificent climber, with a two-lobed leaf. It hangs in elegant festoons from the tops of lofty trees, which one is at a loss to conceive how, from the distance of its root from the stems, it could ever have ascended; but occasionally a half-killed tree displays the mode of its progress, and indicates the destruction it must have created in the forest. With the bark of this plant, which, when stripped off, is of a reddish-brown colour, the natives of the mountains make ropes, the stems are usually cut in July and August; the outer bark being stripped off, is thrown away, and the inner is used for ropes, as wanted, by being previously soaked in water, and twisted when wet. It is also said to be boiled and beaten with mallots, which renders it soft and pliable for being twisted into ropes and strings for the sleeping cots styled charpacs. Though the fibre makes very strong ropes, it is not over-durable, and rots if kept constantly in water. Its strong coarse ropes, answer well for suspension bridges, but some had been in use only for two or three years, and iron suspension bridges substituted."—*Royle Himalayan Botany*, p. 184.

MALO-KALANG. The fruit of a plant called quixpo by the Indians, and by the Spaniards malo kalong, is celebrated for its

MALTA.

being the basis of a kind of soap, for which it is a substitute in the Philippines. It is a species of the water lily, and grows in all the rivers; its leaves are very large, resembling those of the cow lily. It bears a fruit nearly the size of an apple, the pulp of which, after maceration, is boiled in the common manner with potash, and produces soap of a very good quality.—*White's Voyage*, p. 149.

MALORI GHA, HIND. *Rumex hastatus*.

MALOWN capitulated on the 15th May 1815.

MALOZA a town and river in Basellan island, one of the Philippines.

MAL-PATAR, CAN. *Circaetus Gallicus*.—*Gmel*.

MALPHIGIACEÆ. The Barbadoes Cherry tribe of plants which consists of 9 genera 17 species, viz. 3 *Malpighia*; 2 *Byrsonima*; 1 *Gaudichandia*; 2 *Hiptage*; 4 *Hiraa*; 1 *Stigmatophyllum*; 1 *Heteropteris*; 2 *Banisteria*; 1 *Ancistrocladus*. Of the properties of the plants of this Order little is known.

MALPHIGHIA COCCIFERA. A small stunted shrub, with leaves resembling the box; common in gardens. *M. Heteranthera* a handsome shrub, with leaves like the holly, and nearly related to the Barbadoes cherry, is occasionally cultivated in European gardens. *M. puniceifolia*, the Barbadoes cherry is an ornamental shrub introduced from the West Indies. *Hort. Garden* 25.

MALT.

Mount,	Dur. Maltum,	LAT
Mal, Bledgerme,	FR. Solod,	RIS.
Malv,	GER. Cobada retonadao	
Malto,	It. entalledda,	SE

Malt is grain, steeped in water, and made to germinate to a certain extent, after which the process is checked by the application of heat. This evolves the saccharine principle of the grain, which is the essence or malt. Rice, and almost every species of grain, has been used in malting; but in Europe, and especially in England, malt is almost entirely prepared from barley. It is the principal ingredient in the manufacture of beer, and is little used except in brewing and the distillation of spirits.—*Faulkner, McCulloch's Commercial Dictionary* p. 777.

MALTA. An island in the Mediterranean sea in lat. 35°54' N., lon. 14°31' E., about 200 miles from the African Coast and 60 from Cape Pessaro in Sicily; its length is about 17 miles, and average breadth 9 miles. The population, exclusive of the garrison and sailors of the fleet, comprising a mixture of Maltese, Frauks, Greeks, Africans, and na-

MALVACEÆ.

tives of the Levant, is estimated at about 106,000. Malta has been successively occupied by Phœnicians, Greeks, Carthaginians and Romans; on the decline of the Roman power it was seized by the Goths and Vandals, and then passed for a short period into the hands of the Eastern Emperors, who surrendered it to the Saracens. It then came into the possession of the Norman and German kings of Naples, with whom it remained until 1522, when it was granted by Charles V. to the Knights of St. John of Jerusalem, who on several occasions valiantly defended it against the Turks, but surrendered it to Napoleon on the 12th of June, 1798, at the first summons. The island was soon after blockaded by the British fleet under Lord Nelson, and, after suffering severe privations, the French finally relinquished the island to Sir Alexander Ball in August 1799.

MALTHA or Sea Wax. A solid, whitish, inflammable, vegetable substance, not unlike tallow, and may be impressed with the nail. It swells when heated, and on cooling assumes the consistence of white cerate. It affords a better light than petroleum, and emits a less disagreeable smell. It is found on the surface of the Baikal lake in Siberia, at the foot of the Bakhtiari mountains in Persia, and other places.

MALVE. See Nicobar Islands.

MALWA. The rajas of Malwa, the capitals of which are Ujjayana and Mandor, are known from the writings of Abul Fazi whose information is supposed to have been flourish-

MALWA.

ed from Jain authorities. It would appear that in early ages, Mahabmah founded a fire temple, which was destroyed by buddhists, but restored in B. C. 840 by Dhanji (Dhananjaya) a name of Arjun, about 785 before Vikramaditya. Between A. D. 866, and A. D. 1390, the country repeatedly changed hands from hindu to mahomedan sovereigns from the time that in S66 Maldeva was conquered by Sheikh Shah, father of Ala ud din, to 1399 when Dilawar Khan Ghori, viceroy of Malwa assumed sovereignty. Malwa was added to the Delhi empire by Haimayun, before his flight. The peshwas, the southern jaghiredars, the principal officers of state, and chiefs who remained in the Mahratta countries south of the Taptce, were brahmins. The Bhonslahs, who early possessed themselves of Nagpoor, the Gackwar of Guzerat, and the family of Puar, who settled in Malwa, were of the Khetri tribe. The Sindia and Holkar families were of the sudra caste. At the close of the Pindaree war, the districts in Central India and Malwa were left in a disorganized state, the Mahratta chiefs had parcelled out amongst themselves the possessions of the Rajput chiefs and the smaller states were all subject to Sindia, Holkar or the Puar, and sometimes to all three. Many of the smaller chiefs had been driven from their possessions, and had sought refuge in the jungles and mountains where they robbed or levied "tankhah" or black-mail from the larger states. These robber chiefs were twenty-four in number at sir J. Malcolm's time. Malwa and Gwalior are great centres of trade. In Malwa, the towns of Indore, Bhopal, Oojein, Mundipore, Rutlam, Dhar, Jowra, Augur, Neemuch, Shoojawulpoor and Bhilsa are the principal marts. The richly cultivated plains of Malwa with occasional intervening tracts of hill and jungle, extend from the Myhee on the west to Bhilsa on the east, a stretch of nearly 200 miles, and from the crest of the line of the Vindhya to Mundissore and Oomutwarra, a distance of 100 to 120 miles, all occupied by a thrifty, agricultural, people. This succeeded by the more hilly and jungly tract of Oomutwarra, Seronge and Keechiwarra, with a scanty population. Northwards, towards Gwalior, the country becomes more open, except on the wild border tracts of Kotah of Bundelcund till we come to the carefully cultivated plain of Gwalior stretching for a distance of 140 miles between the Chnmbul, Pahooj and Sind rivers. Western Malwa Agency embraces Jowrah, Rutlam and Sillana. The districts of Western Malwa are subject to the inroads of the Bhools from Banswara

MALWA.

and Pertabgurh. In 1861 an engagement was made with the Thakcoors on the frontier, in whose districts the principal passes of the hills are situated, to unite and oppose the incursions of the Bheels. Under an engagement mediated by sir John Malcolm in 1819 between Purbut Sing, Rajah of Rutlam, and Dowlut Rao Sindia, the former agreed to pay an annual tribute of Salim Sahee Rupees 84,000, while Sindia undertook never to send any troops into the country or to interfere in any way in the internal administration or succession. This tribute was assigned under the treaty of 1844 with Sindia in part payment of the Gwalior contingent. It is now paid to the British Government under the treaty of 1860. The rajah of Rutlam is considered the principal Rajpoot leader in western Malwa, and in consequence receives a voluntary allegiance and assistance if called for from the neighbouring Rajpoot chiefs. The late rajah Balwant Sing rendered good service during the mutinies, in recognition of which his successor Bhyron Sing received a dress of honour of Rupees 3,000 and the thanks of Government. The military establishment of the rajah of Rutlam consists of 500 sepoy. The revenue from all sources is estimated at Rs. 3,64,064 and the population at 94,839. The town of Rutlam is the principal opium mart in western Malwa. The area of Rutlam is about 500 square miles. Sillana pays an annual tribute of Rupees 42,000 under the same conditions as Rutlam of which territory it originally formed a part. The tribute is paid to the British Government under the treaty with Sindia of 12th December 1860, having been assigned in 1844 in part payment of the Gwalior contingent. The revenue of Sillana is estimated at Rupees 2,49,000; the population at 88,978 and the area at about 103 square miles. Seetamhow, like Sillana was once a part of Rutlam, but separated from it in A. D. 1660 on the death of Ram Singh, rajah of Rutlam. A tribute of Rupees 60,000 from this state was guaranteed to Sindia by an agreement mediated by sir John Malcolm in 1820. The total revenue of Seetamhow is about Rs. 1,50,000, and the population about 20,000. In consequence of repeated representations from the rajah, 5,000 of the annual tribute were remitted in 1860 by Sindia of his own free will on the occasion of the rajah's son waiting on him at Gwalior. An intimation of the remission was given to the rajah of Seetamhow in a letter from Sindia to his address. The rajah of Seetamhow remained faithful to the British Government during the mutiny of 1857, and received a dress of

MALWA.

honour of Rupees 2,000. The rajah keeps up a military force of 40 horse and 200 foot.

Punt Peerlodah. In 1821 Naroo Dhandeo and Wasadeo Jinardin received from sir John Malcolm a sunnud which was confirmed by the Supreme Government whereby they received tribute on ten villages in the district of Mundavul and sonbah of Mundisore. Naroo Dhandeo was succeeded by his son Gopaul Rao. The jaghiredars furnish reports of crime to the Political Assistant. The settlement of *Peerlodah* chiefship, under which a tribute of Salim Sahee Rupees 28,000 is paid to the nawab of Jowrah in accordance with the 12th article of the treaty of Mundisore was made with Pirthoe Sing by sir John Malcolm in 1820. The thakoor receives from Kishnajeo Rao Pnar of Dewas, Rupees 138 on six villages and from Hybat Rao Pnar Rupees 115 on five villages in Goorgoocha. He also holds a grant of land in the village of Betekheree in Alote district from Kishnajeo Rao Pnar; and he receives Rupees 1,000 damies from Tual and Mundavul.

Jawasea thakoor receives, besides tunkhas, quit-rent, for the villages of Jawasea for Rupees 501, Goorkheree for Rupees 201, and Chaplakheree for Rupees 341-8 in Dewas. He also holds in jaghire a well and 16 beegahs of land in the village of Soondwurnee, and a well and 25 beegahs in the village of Biwasce. But none of these tenures appear to have been mediated or guaranteed by the British Government.

Norlaha thakoor receives, from Sindia, Rupees 1,570 and from Holkar Rupees 1,650, he also holds in jaghire the village of Satara in the Deypalpore pergunnah, where he also has 40 beegahs of land in jaghire. But for these he has no sunnuds.

Theogurh thakoor receives from Sindia Rupees 3,200 and from Holkar Rupees 623.

Dabree thakoor receives Rupees 180 from Sindia on Oogein and Pan Behar. He receives his tunkha. He also claims certain rights of "lag" and "bhet" on the village of Sawurkheree and Kudwuree in the Pan Behar pergunnah and "Kalidy," Ukouta, "Karrundie," "Ootara," in the Oogein pergunnah, and states that he originally held 500 beegahs of land in the village of Dabree; but he has no sunnud for these.

Bichrode thakoor receives a tunkha from Sindia, he holds in jaghire 20 beegahs of land in the village of Kherkheree in the Pan Behar pergunnah under Sindia.

Kalookhera thakoor receives Rupees 3,261 on tunkhas.

MAMBRE.

Nurwar thakoor receives from Sindia Rupees 17,100, and from Dewas, Rupees 25,512. Besides the above he holds in quit-rent tenure the villages of Nurwar, Mochakheree, and Goomree under Sindia for which he pays Rupees 7,000.

Lalgurh and **Peepia** thakoors receive tunkhas.

Nowgong thakoor receives a tunkha Rupees 114 from Sindia. He holds in jaghire under Sindia 100 beegahs in Nowgong, 75 beegahs in Purwar-Kheree, 100 beegahs, a tank, a well, and a garden in Dutana.

Dutana thakoor receives a tunkha of Rupees 186 from Sindia and holds lands in jaghire from Sindia in Dutana, Umtana, Soonderkheree, Gorkheree, and Balkheree.

Ajawaia, receives a tunkha from Holkar and from Sindia.

Dhoolatin thakoor receives Rupees 400 from Sindia, he holds a perwanah from Colonel Sandys.

Bichrode thakoor receives a tunkha of Rupees 430 from Sindia.

Biloda receives tunkhas.

Burdia receives tunkhas.—*Thomas' Prinsep*, p. 259. *Orme, Malcolm's Central India Vol. I.* p. 67. *Treaties, Engagements and Sunnuds*, Vol. iv. p. 364.

MALWA BAKCHI. HIND. *Serratula anthelmintica*.

MALYAVANA. SANS. From mala, a necklace.

MALTZ. GER. Malt.

MAMALIAPURAM. See Mavaliveram.

MAMAREE, a pretty village with many brick buildings and a fine nuborattun or nine-pinnaced hindoo temple.—*Tr. of Hind.* vol. i. p. 149.

MAMASENI. A nomade tribe dwelling in Luristan, and belong to the Lur family, as do likewise their neighbours the Khogilu and the Bakhtyar, who, like themselves, occupy the valleys of the great chain of Zagros which separates Iraq Ajam from the provinces bordering on the Persian Gulf. All these tribes are the descendants of the ancient Zend race and the Mamaseeni claim great antiquity, the country inhabited by the Mamaseeni, may be comprised approximately within the following limits:—the direct dependencies of Fars, to the east; Kazerun, to the south; the Khogilu tribes, and the hilly country descending towards the Persian Gulf, to the west; and the chain of the Ardekan mountains to the north. The tract of land occupied by the Mamaseeni bears the name of Shulistan.—*Baron C. A. De. Bode's Travels in Luristan, and Arabistan*, p. 262.

MAMBRE. HIND. *Ficus reticulata*.

MAMMALIA.

MAMBU.—The bamboo.

MAMECH. HIND. *Polygonum bistorta*.

MAMEERA also written Mameeran, are of two different kinds in the Lahore bazaar, the one from Cashmere, the other from China, called Khutai (Scythea). The latter is official all over the East, being much used by the hakims, who deem this root to be a specific in ophthalmia; but, the gemino drug is seldom to be met with, as it has many substitutes, *Chelidonium majus* and *C. glaucum*. But Dr. Royle affirms *Ranunculus ficaria* or *ficaria* to be the plant from which the Cashmerean mameera is produced. Both sorts are used, in general externally, and in composition with other drugs, are applied to the eyes as a dry collyrium.—*Houigberger*, p. 304. See Mamira.

MAMEKH. HIND. *Paeonia officinalis*, grows at about 8,000 feet in the Hazara Hills, &c.

MAMELUK. These were of two races, the Baherite and the Borgite, the latter of Circassian origin. In the times of Selin the first, the Mameluks were all of pure Circassian blood, and their ancestors had all been originally slaves.

MA-MARAM, TAM. *Mangifera Indica*, *Linn.*

MAMMALIA. The animal kingdom was divided by Cuvier into four great sub-divisions, Vertebrata, Mollusca, Articulata and Radiata. The Articulata has since been greatly sub-divided, and the limits of two of the other sub-divisions have been slightly altered. Vertebrate animals comprise four distinct classes, some of which, viz., Fishes and Reptiles have blood nearly the temperature of the water or air in which they live, whilst the others, viz., the Birds and Mammals are warm blooded. Mammals are warm-blooded, vertebrate, viviparous animals, and are distinguished from birds, as well as from the other vertebrate animals, by the possession of mammary glands, secreting milk for the nourishment of their young and terminating outwardly in all (except in one or two) by teats. They are also distinguished by a covering of hair, except whales, but even the fetus of whales has some tufts of hair. Most mammals have four limbs, from which they were formerly termed quadrupeds, but that term has been

MAMMALIA.

discontinued as it is not applicable to the Cetaceæ. The leading peculiarity of the mammals is their power of nourishing their new-born young with milk. This is secreted by mammary glands, and these vary in number and position, being most numerous in the more prolific races. In cold climates several animals pass the winter in a state of torpidity, and even in India, certain bats and hedge hogs, and perhaps some rats are more or less torpid during the cold season. Two species of bears found in the Himalaya retire to their caves during winter, and are rarely or never seen from the month of December till the end of March.

Dr. Jerdon divides Mammals into Placental or those in which the fetus are nourished in the maternal uterus by means of a placenta: and Implacental or Marsupial or those in which the young fetus is expelled at a very early period and maintained in a pouch firmly attached to a nipple. None of the Implacental or Marsupial animals occur in the Asiatic provinces, being chiefly developed in the Australian region and a few in America.

Mr. Blyth arranged the Placental Mammals into

A. Typodontia, animals with the typical forms of teeth developed, and include man, monkeys, bats, carnivorous animals and shrews. The majority live on animal food.

B. Diplodontia, rarely more than two kinds of teeth, and include rats, squirrels, deer, sheep, cattle, the elephant, pig, horse, and the almost toothless ant-eater. They chiefly live on vegetable matter.

C. Isodontia, teeth, when present, are all of one kind, and comprise the whales and porpoises.

The details of the above classification are thus shown,—

A. Placental Mammals, Fetus nourished in the uterus, through a placenta.

I. Typodontia, Teeth of all four kinds.

1st. Group, PRIMATES, Hair of one kind only.

ORDER. *Quadrumanæ*, with thumb on the feet.

„ *Cheiroptera*, winged,

2nd. Group, SECUNDATES, Hair of two kinds.

ORDER. *Carnivora*, Molars trenchant, mixed with tubercular ones.

„ *Insectivora*, Molars studded with cusps.

II. Diplodontia, Teeth generally of two kinds only, abnormal.

ORDER. *Rodentia*, Front teeth long and chisel like.

MAMMALIA.

ORDER. *Pachydermata*, Teeth varied, skin thick, do not ruminate.

" *Ruminantia*, upper incisors generally absent, chew the cud.

" *Sirenia*, want posterior extremities.

" *Edentata*, Incisors absent.

III. *Isodontia*, teeth, when present, of one kind and often very numerous.

ORDER. *Cetacea*, Posterior extremities wanting.

B. Implacental or Marsupial mammals.

I. Unguiculata, with nails.

Colonel Sykes published a list of the animals observed by him in the Deccan. Mr. now sir Walter Elliot, in 1839, gave a Catalogue of the Mammalia of the southern Malabar country. Mr. Hodgson published several lists of the Mammalia of Nepal. Colonel Tickell gave a detailed history of a few animals. Major Hutton recorded some facts on the mammals of Afghanistan. Mr. E. L. Layard, Dr. Kelaart, Dr. Templeton, Sir J. E. Tennent have almost exhausted the subject of the animals of Ceylon, Dr. Horsfield and Sir T. S. Raffles were amongst the first who described the animals of the Eastern Archipelago, and Professor Bickmore and Mr. Russell Wallace have recently extended their researches. Dr. Cantor furnished a valuable list of the mammalia of the Malay peninsula, Dr. T. C. Jerdon in 1867 published the Mammals of India, and the labours of all these Zoologists were revised by Mr. Blyth of the Calcutta Museum, in many notices and reviews in the scientific journals of the day.

Southern India, more particularly the richly wooded Malabar Coast, possesses more species peculiar to it than all Central and Northern India, except the Himalayan range. Of the animals only found in the Himalayan range, several equally belong to the Indo-Chinese fauna, of which they appear to be the Western extension, and a few others to Central Asia, whilst a moderate number appear to be peculiar to the Himalayan mountains. The Langoor monkeys (*Presbytis*) form a well marked group in India and are still further developed in the Indo-Chinese provinces and Malaya. Out of five continental species, one is spread through all the plains of Central and Northern India, one through the Himalayas, and there are three well marked species in the extreme South of the peninsula. *Macacus radiatus* of Southern India, replaces *inuus rhesus* of all Northern and Central India. A well marked form of this group, *inuus silenus* is peculiar to the South-west corner of the peninsula. The Lemurs are almost

MAMMALIA.

peculiar to Madagascar, but one species is very abundant in the extreme south, and a Malayan species extends sparingly through Burmah into the N. E. corner of Bengal.

Two species of frugivorous bats are spread all over India and one species occurs only in the south.

Of insectivorous bats, seven species of *Rhinolophus* have been found in the Himalayas, but only two species in southern India. The *Hipposideros* section is represented equally in the north and south of India, and is more Malayan. The *Colops* of Blyth has, as yet, been found only in the Bengal Sundurbans. • The yellow bellied *Nycticeji* occur pretty generally throughout India, *N. ornatus* occurring in the Himalayas. A few European forms are found in the Himalayas. Moles occur in the Indo-Chinese region and in the S. E. portion of the Himalayas. Shrews occur in all parts of India, but are most abundant in the Himalaya. One species of *Tupaia* occurs in southern India, and another from the S. E. Himalayas to Burmah. Of the Carnivora, two species of bears are Himalayan, and a third species extends throughout all the plains of India. *Ailurus fulgens*, one of the *Ursidae*, is peculiar to the Eastern Himalayas. Weasels occur only on the Himalayas, one martin is found both on the Neilgherries and Himalayas, one species of otter is found in the south of India, in Bengal are two species, and others occur in the Himalayas. Of fifteen feline mammals found in India, five are common to India and Africa, seven are found in India and the Indo-Chinese region, but three of these occur only in the S. E. Himalayas. One, the ounce of central Asia, is Himalayan, and the smallest of the feline animals are peculiar to the plains of India, two of them in the extreme south of the peninsula, and the other on the N. West. Of the strictly Asiatic *Paradoxurus*, more Malayan than Indian, one species is common in most parts of India, and two occur on the Himalayas and adjoining Terni. The genus *Herpestes* is common to India and Africa, out of seven Indian species, five occur only in the south of the peninsula and of these four only in the extreme south. One small *Civet* cat is found throughout India, and is common in the Himalaya. A large species on the Himalaya replaced by a different race in the extreme south. *Arctonyx*, *Arctictis*, *Helictes*, *Urva*, and *Prionodon* are found in the S. E. Himalayas and in the Indo-Chinese region. The wolf, the jackal and wild dog are found throughout India; two small desert foxes are found throughout the plains and a fox of the European type

MAMMALIA.

occurs in the Himalayas. Squirrels are found throughout India, up to the foot of the Himalayas, in the Indo-Chinese region, Assam, Burmah and Malaya. One species of flying squirrel is limited to the extreme south of the peninsula, one in the south of the peninsula but several species in the Himalaya. Marmots only occur in the Himalayan region, to which they have been extended from Central Asia. Of the Muridæ, Golunda, three species of *Leggada*, and the curious *Platacanthomys* are peculiar to the south of India: *Arvicola* occurs only on the Himalayas, and *Rhizomys* in the Himalayas and the Indo-Chinese district.

One species of hare is found in the south of the peninsula, another in northern and Central India; the hispid hare in N. E. Bengal and *Lagomys* on the Himalayas. One elephant is common to all India, two species of rhinoceros occur in N. E. Bengal, one of them is tending to the extreme south of the Malayan peninsula, one wild pig occurs throughout all India, varying slightly in appearance, and a peculiar dwarf species is found sparingly in the Terai, adjoining the S. E. Himalayas. The wild ass of Western Asia and Persia is found in the North Western deserts. Two species of the true deer of the Red deer type occur only within the Himalayas, beyond the outer range in Kashmir and Sikkim and these two extend over a great part of Asia. Four *Rusina* deer are found throughout India, one of them, the *Racervus*, occurring only in the Central and Northern India and extending into Assam. The musk deer is only in the Himalayas, and the marmoset or mouse deer throughout India and in Malaya. The Nylgai and four horned Antelope peculiar to India, are found throughout the Indian region. Gazelles occur both in India and Africa. The goat-like Antelope, *Nemorhedus* is found on the Himalayas and is peculiar to Eastern Asia from Burmah to Japan. One type of the true goats, the type *Hemitragus*, has a representative on the Himalayas and another on the Neilgherries. The Siberian ibex extends to the Himalayas, and the "Markhor," quite of the type of the domestic goat is found on the N. W. Himalayas and adjoining hilly districts. Of two species of wild sheep one occurs in the Panjab salt ranges and the other in the Himalayas.

The bison of sportsmen, the magnificent Gaur, *Gavæus gaurus*, abounds in the forests of S. India and extends into Central India, Burmah and the Malay peninsula.

Two species of the *Manis*, the scaly Ant-eater, occur, one common throughout all

MAMMALIA.

India, and one extending from Darjeeling into China.

The Dugong occurs sparingly, on the southern coasts of India, various species of Delphinus, one *Globicephalus*, and one *Balaenoptera* and the fresh water porpoise of the Ganges, Indus and Irawadi, is a peculiar type the *Platanista*. The classification of the Mammals of India may be thus shown:—

Along the base of the Himalayas, in the dense jungles, an occasional tiger prowls; the leopard is not uncommon; while many of the game birds about Dugshai are there also plentiful. Among the lesser ranges bordering the plains and to an elevation of 8,000 or 9,000 feet, barking-deer are common; and on the more secluded and craggy mountains, the goral or chamois of the Himalayas may be occasionally seen sporting among the pine-clad precipices. This little antelope is gregarious, feeding in scattered herds, so that when the loud hissing call of alarm is uttered by one individual, the others, one by one, take it up; and the hunter, from a prominent position, may see from ten to twenty gorals in different parts of the hill bounding across the precipices. The goral is rather higher than the barking deer and more compact and agile in appearance.

The native dog of the Jhelum district has a great resemblance to the pointer, and doubtless was introduced from India. Mr. Vigne makes a similar remark with reference to the dogs of the Rajawur district, south of the valley of Cashmere, where a formidable breed is also found, having the external appearances of the shepherd's dog, but much larger. A closely-allied form, not differing in any way from the Scotch collie, is common all over the cultivated regions of the western Himalayas, and even westward to the sources of the Oxus, as observed by Lieutenant Wood. This uniformity is in favour of the view that the shepherd's dog forms almost a permanent race, which may have been one of the original varieties. The Tibetan black bear *Helarctos tibetanus*, probably finds its way across from the lower Himalaya. The black bear of the southern provinces (*U. labiatus*) is not found in the Panjab. *Helarctos tibetanus* is common in the Panjab, and hunts among the ravines and around the villages at night.

The isabella, or brown bear of the Himalaya is an exceedingly stupid and unsuspecting animal in districts where it has not been disturbed. The contents of the gall bladder are much prized as medicine by the hill people.

MAMMALIA.

The ran-hun or wild dog, *Canis primævus*, is a native of the Cashmere ranges, and although not so common, is by no means rare; it is so stealthy in its habits that all attempts to obtain specimens often prove abortive. They hunt in packs, and attack the largest deer. Even the Cashmere stag is said to be brought to bay and killed by packs of wild dogs. The wild dog seen by Dr. Hooker on the Khasia mountains, and known there by the names kulsam and khas, may be a different species, though Colonel Sykes considers it identical with the kolsum of the Deccan (*C. dukhunensis*).

The strange looking goat antelope (*Capricornis bubalina*), known by the name "ramoo" in Cashmere, and "serou" in other districts of the western Himalaya, is perhaps the rarest of the wild ruminants. Occasionally the sportsman comes across an individual in the depths of the Alpine forests, but the animal is very solitary in its habits, and seldom more than a couple are seen together. Both in figure and movements the serou is perhaps one of the most ungainly of its tribe, and so stupid is it that when come on unawares it will stand and gaze at the intruder: even the report of a rifle seldom scares it. The serou has the legs of a goat, the horns of an "antelope," its general appearance is bovine; whilst the long stiff bristles on its back, and general shape of the head, are decidedly porcine; a sort of nondescript beast, which European sportsmen often call a "very extraordinary looking animal" and so it is. The serou is said to fight desperately; it has been known when wounded or brought to bay, to have kept off a pack of wild dogs, and killed several by its sharp pointed horns. A few are met with on the Cashmere ranges, and in favourable situations eastward to Nepal.

The Houriar (*Caprovius Vignei*) extends along the eastern spurs of the salt mountains, but becomes less common as we proceed eastward, and is seldom met with on the ranges beyond the town of Jhelum, or southwards of the Beas River. It is confined to the north and western portions of the Punjab, including the Suliman chain, where it is known by the name of Kuch. It is also a denizen of the mountains around Peshawar, including the Khyber Pass, Hindu Koh, and Kaffirstan. The shapoo or shalmar of Ladakh, if not identical, is certainly very closely allied; its differences are slight, and, such as might result in a great measure from the marked diversity of climate, food, &c., of the two regions. This species is no doubt

MAMMALIA.

the Sha of Tibet described by Vigne, and possibly the wild sheep of western Afghanistan, Persia, the Caucasus, Armenian and Corsican mountains, is the same species altered mayhap by climate and other external agencies. The eastern limits of the Shapoo have not been fixed with certainty; but so far as inquiries have extended, it would seem that, commencing at Ladakh, it proceeds westward towards the Indus, into the regions where the houriar is found, and probably when these regions are explored we shall find out the relation between what has been supposed distinct, but which Dr. Adams is inclined to consider one and the same animal.

The ibex (*Capra himalayana*) frequents many of the lofty ranges of the western chains, and is known to the natives by the names "skeen" and "kail," which they apply indiscriminately in the districts of Aserung, Spiti, Kanawar, the Northern Cashmere mountains, Ladakh, Chinese Tartary, and the Altai. It is not clear that the European ibex is a distinct species. There appears to be a variety in Ladakh with shorter horns than the Himalayan, and specimens of the Siberian ibex possess the same peculiarity. The leopards, panthers, wild-dog and bearded vulture, are the common enemies of the ibex; the latter preys on the kids only. The ibex is found on certain ranges in Ladakh, especially on the chains northward.

The Caucasian ibex (*Capra caucasica*) frequents the mountains of Beloochistan and it is likewise a native of the Murree and other ranges on the north-western frontier of Sind. The Caucasus, Asia Minor, Syria, and Arabia, are also countries which it inhabits. It does not appear to travel any great distance eastward, and is probably replaced on the higher ranges of Afghanistan and Persia by its noble congener the Himalayan ibex. The Caucasian ibex has the hair short and dark brown, with a black line down the back. The beard is also black. Like the European and Himalayan animals, the horns are also bent backwards but they differ in being more slender and tapering. In the latter, moreover, the horns are three-sided, and the anterior and posterior surfaces sharp, and generally smooth, with the exception of a few irregular tuberosities on the frontal aspect. Like the other species, it frequents dangerous and inaccessible places, such as bleak and barren mountain tops.—*Jerdon, Mammals.*

170 species of mammalia are known to inhabit Indo-Malaya. There are 24 of the quadrumanous or monkey tribe, 10 of which

MAMMALIA.

occur in the Malay peninsula, 11 of them in Sumatra, 9 in Java and 13 in Borneo. The Orang-utan are found only in Sumatra and Borneo: the Siamang, next to them in size, in Malacca and Sumatra, and the long nosed monkey only in Borneo. The gibbons or long armed apes and monkeys and the lemur like animals, *Nycticebus*, *Tarsius*, and *Galeopithecus*, are found in all the islands. With the exception of the Orang-utan, the Siamang, the *Tarsius spectrum* and the *Galeopithecus*, all the Malayan genera of *quadrumana*, are represented in India by closely allied species. In the Indo-Malay region are 33 Carnivora, 8 of which—a tiger, leopard, civet, tiger-cat and otter are found in India and Malacca and 20 in the Malayan region: 13 have representatives in India, of closely allied species.

The Malacca glutton, *Helictis orientalis*, has the *H. Nepalensis* in the Himalaya. There are 22 hoofed animals in Indo-Malaya, seven of which are found in India and Burmah. The *Bos sondaicus* is found in Burmah, Siam, Java and Borneo. There is a goat-like animal in Sumatra; the two horned and the long horned rhinoceros occur in Burmah, Sumatra and Java, and the elephant of India is found in Malacca, Sumatra and Borneo. There are about 50 bats, of which under a fourth part occur in India; 34 rodents (squirrels, rats &c.) of which 6 or 8 are Indian, and 10 Insectivora, 9 of which are peculiar to the Malay regions. The Tupia, insect-eaters, closely resemble squirrels, are almost confined to the Malay islands, as also are *Ptilocercus Lowii* of Borneo and *Gymnurus Raflesii*. In Timor, there are 15 bats, and 7 land mammals; amongst them the *Macacus cynomolgus*, the common monkey of all the Indo-Malay islands: *Paradoxurus fasciatus*, a civet cat, is found over much of the Archipelago:—

Felis megalotis, a tiger cat is peculiar to, and rare even in Timor. *Cervus Timoriensis*; *Sus Timoriensis*; *Sorex tenuis*, and *Cuscus orientalis*, are all found in Timor and the Moluccas. Horses said to be wild in Timor are all private property.

The mammalia of Celebes consist of 7 bats and 14 terrestrial species, amongst them the *Tarsius spectrum*, *Viverra tangelunga* and *Rusa hippelapha*: *Cynopithecus nigrescens* in Batchian, is of a jet black colour and the size of a spaniel.

The Anoa *depressicornis*, called "sapi utan" or the wild cow of the Malays, approaches the ox-like antelopes of Africa, and has been classed as an ox or a buffalo and antelope. It is found only in the mountains and never occupies places where there are deer.

MAMMALIA.

The wild boar of Celebes is peculiar, but the Babirussa or Pig deer there, has long and slender legs and the male has curved upper tusks turned back so as to resemble horns. It feeds on fallen fruits, it is found in the Celebes, in the Sulu islands and in Bouru. There are also 5 species of squirrels and 2 species of Cus-cus or eastern opossums.

The Anoa *depressicornis*, (*Sapi utan*, Malay) is the wild cow of Celebes. It is smaller than other wild cattle. It is found in the mountains. *Cynopithecus nigrescens*, the black baboon monkey is also of Celebes. *Paradoxurus fasciatus* is a civet cat of Timor.

The Moluccas consist of three large islands, Gilolo, Ceram and Bouru, with many small isles and islets, Batchian, Morty, Obi, Ke, Timor-laut, Amboyna, Ternate, Tidore, Kaiva and Banda. There are 25 bats but only 10 land mammals are known in the group, amongst them *Cynopithecus nigrescens*, *Viverra tangelunga*, *Rusa hippelaphus*, the Babirussa, *Sorex myosurus*, common to Sumatra, Borneo and Java, and four marsupials viz. the small flying opossum, *Helideus ariel*, a beautiful little animal resembling the flying squirrel in appearance, and a species of *Cuscus*, peculiar to the Anstro-Malayan region. They are opossum like animals with a long prehensile tail, of which the terminal half is generally bare, they have small heads, large eyes, and a dense covering of woolly fur, often pure white with irregular black spots or blotches, but sometime ashy brown. They live in trees and feed on the leaves of which they devour large quantities: they are very tenacious of life.

The Papuan islands, consist of New Guinea 1,400 miles long and its adjacent islands. In them only 17 mammals as yet are known, viz. 2 bats, 1 *Sus papuensis* and the rest are marsupials, one of these a kangaroo of Mysol and the Aru islands. An allied species occupies N. Guinea. Two species of the tree kangaroo with powerful claws. There are 4 species of *Cuscus*, and the small flying opossum, and there are 5 small marsupials, one of which is the size of a rat and takes its place by entering houses and devouring provisions. Wallace, *Malay Archipelago* vol. i. pp. 146, 208 279 and ii. 79, 263.

The maral, a large stag, is found in all the higher regions of the Ala-tan and Mus-tau: he affords noble sport for the hunters, and his horns are highly valued by the Chinese. But it demands a fearless hunter to follow him into his haunts among the precipices, glaciers, and snowy peaks of this region. In winter and spring, he is found in the valleys, but as the weather becomes warmer he ascends, to escape the flies and

MAMMALIA.

other insects. They are seldom found in herds, though groups of ten or twelve are sometimes seen standing on the brink of a precipice 1,600 to 2,000 feet in height, quite inaccessible to man.

Two Cossacks hunting the maral, followed the game far up into the Ala-tau, and had been successful: they started again in pursuit, and found a magnificent animal, whose horns were worth 120 roubles.—*The Upper and Lower Amoor*, p. 110 112.

We have the evidence of Jehangir, and the Reverend Edward Terry, that in their days, the province of Malwah abounded with lions. Jehangir records, that he had killed several and Mr. Terry mentions his having been frequently terrified by them, in his travels through the vast woods and wilderness of the country.—*Tenants Hindustan Vol. I. p. 78-9.*

Elephants are common in Burmah, in Ceylon, in the peninsula of India and in the Terni. They were not in use by the Moguls as Polo tells, until Kublai's capture of a number in the war with Mien or Ava. A few continued to be kept at the Chinese Court, at Timkowski's visit in 1821.—*Yule Cathay*, p. 140.

The barking-deer (*Corvus muntjac*) is frequent in several parts of India. The Chevrotin or pigmy deer, are not much larger than hares.

Of the Cetaceæ, the whale tribe of Mammals, of the family of Balœnidæ, there are in India, 4 genera and 7 species, viz:—1 Balœoptera; 4 Balœna; 1 Physeter; 1 Phocœna. Balœna antarctica the antarctic or smooth backed whale, in spring resorts to the bays of Chili, South Africa, the Brazils, Australia and Van Diemens land.

The Zoology, like the Botany of the Himalayas differs essentially from that of the sultry plains of India, which skirt their southern base; though occasionally mixed with tropical forms, it is upon the whole of a character closely resembling that of the more temperate and northern latitudes; and the insulated position of these remarkable mountains, exhibiting, as they do, the rare and interesting phenomenon of a temperate and even a boreal climate on the very confines of the tropic, where the summer heat is necessarily greater than even under the equator itself, are of importance to inquiries connected with the geographical distribution of Animal Life. The principle of animality, possesses an innate power of adaptation which renders Animals in some measure independent of climate, particularly as compared with vegetables, and which increases in proportion as we ascend in the scale of

MAMMALIA.

life. The power which all animals possess, in a greater or less degree, of adapting themselves to different varieties of climate, and of withstanding, uninjured, the effects of temperatures foreign to their natural habits, increases in proportion as we ascend from the lower to the higher tribes; and the Mammalia undoubtedly form one of the most favourable groups for the discussion of this important question. Indeed, were it not from their limited powers of locomotion, they would be the very worst of all, because their high position in the scale of life, and the superior intelligence and resource with which it endows them necessarily protect them against changes and casualties, which would prove fatal to more simply organized beings; but, deprived of the powers of flight, ordinary mammals have not the means of traversing the wide deserts and oceans, which separate the habitable portions of the earth: the nature of their locomotive powers consequently confines them to particular regions; and, in spite of the more favourable circumstances of their physical organization, their more varied resource and superior intelligence, they afford better materials for studying the problem of geographical distribution, than the kindred class of birds, whose faculty of rapid flight enable them to set oceans and deserts equally at defiance, in passing to the most distant quarters of the globe, and, as it were, to choose their own temperature and climate in the boundless fields of air. Hence it is that the circumstances of the important problem of geographical distribution are less favourably presented in Ornithology than in Mammalogy.

The species of mammalia found in the Southern Mahratta Country, were described by Mr. Walter Elliot, of the Madras Civil Service in the Madras Literary Society's Journal July 1839. The district of India, in which the animals were procured, is a part of the high table-land towards the south of the Dekhan, commonly called the Southern Mahratta Country, and constitutes the British zillah of Dharwar. It ought, likewise, geographically speaking, to include the small province of Sunda. The general boundaries are the rivers Kistnah and Bhima on the north and N. E.; the Tum-budra river on the south; the Nizam's territory on the east, and the Syhadri range of mountains on the west. The latter are generally called the Ghats; a term which, however, properly applies only to the passes leading through them. The general face of this tract is much diversified, and affords a great variety of elevation and of geological structure, thereby materially affecting the

MAMMALIA.

distribution and the habitat of the different species of animals existing within its limits. The whole of the western portion is a thick forest, extending from the outskirts of the mountainous region of the Ghats to their summits, and clothing the valleys that extend between their different ridges. It abounds with the teak and various other lofty forest trees, festooned by enormous perennial creepers. The bamboo forms a thick and luxuriant underwood in some places, while others are entirely open, and the banks of many clear and rapid streams flowing through it, abound with the black pepper plant, the wild cinnamon and other odoriferous shrubs. Portions of this forest are often left entirely untouched by the axe or knife, forming a thick impervious shade for the growth of the black pepper, cardamom and Mari palm (*Caryota urens*). These are called kaus and are favourite resorts of wild animals. To the east of the regular forest lies a tract called the Mulnad, or rain-country (though the natives of the plains often include the jhari, or forest, under the same denomination), in which the trees degenerate into large bushes, the bamboo almost entirely ceases, and cultivation, chiefly of rice, becomes much more frequent. The bushes consist chiefly of the karunda, the pallas, &c. It abounds in tanks and artificial reservoirs for purposes of irrigation. East of the Mulnad is a great extent of alluvial plain, producing fine crops of wheat, cotton, maizes, millet, &c. [*Holcus sorghum*, *Panicum Italicum*, *Cicer arietinum*.] And on the Nizam's frontier are found a succession of low dry hills, with tabular summits, often rising in abrupt scarped precipices, and intersecting and traversing the plains in various directions.

MAMMALIA.

They are clothed with low thorny jungle of babul and acacia, and their bases, and the valleys between, composed of a light sandy soil, are cultivated with millet, vetches, &c. *Panicum spicatum*, *Panicum miliare*, *Phaseolus max*, *Phaseolus mungo*, &c. The first or mountainous division consists chiefly of micaceous clay, and other schists, which to the northward are succeeded by basaltic or trap formation. The Mulnad is composed of undulating clay-slate hills, which become covered with basalt to the north. This trap formation extends in a slanting direction from S. W. to N. E. nearly coinciding with a line drawn from Sadasheaghur on the coast, to Beejapoor and Sholapoor—and, what is remarkable, is almost coincident with that marking the separation of the two great tribes of the population using totally distinct languages, the Mahrattas and Canarese. The hills to the N. E. and E. are all of primitive sandstone sometimes resting on schists, sometimes immediately on granite, which latter is the rock nearest the surface in the central and eastern plains. But a well defined range of hills to the S. W., called the Kuppitgad, is entirely composed of micaceous and clay slates, resting on granite. The hills more to the N. and N. W. are basaltic. The extensive plains lying between these different lines of hills and eminences are composed of the rich, black mould called regur or cotton ground, resulting from decomposed basaltic rocks. To the N. E. a considerable tract of limestone is found, resting on the sand stone, about Bagalcote, Badami, Hungund, Mudibihal, &c. The distribution of species throughout these different tracts is shown in the following table: those marked* are confined to one tract only.

MAMMALIA.

Simia radiatus. Madras monkey.

<i>Macacus radiatus</i>		<i>Cercopithecus radiatus</i> , Geoff.	
Koti,	CAN.	Bandar.	DRK.
Manyga,	"	Makada,	MAH.
Munga,	"	Kerda, do. of the	GHATS.

This species abounds over the whole country, sometimes inhabiting the wildest jungles, at others living in populous towns, and carrying off fruit and grain from the shops of the dealers, with the greatest coolness and address.

Simia (Semnopithecus) entellus.

<i>Presbytis entellus</i>		<i>Cercopithecus entellus</i> , Geoff.	
Moosya,	CAN.	Wanur,	MAH.
Langur,	DRK.	Bengal Langur.	

The black-faced monkey of Europeans,—abounds more particularly in the forests, where its loud wild cry is particularly striking. They are both useful and troublesome to the sportsmen, who may often judge by their agitation and chattering of the vicinity of some beast of prey; while he himself is apt to be assailed in a similar manner when trying to steal upon the more timid kinds of game. The species is celebrated in hindu mythology, for having, under their leader Hanuman, assisted the hero and demi-god Rama, the first hindu conqueror of the forests of Southern India, as related in the Ramayana. The Entellus appears to want the cheek pouches characteristic of Semnopithecus. An adult male measured, from muzzle to insertion of tail, 1 foot 10½ in. length of tail alone 3 feet 2½ height from heel to crown 3 feet 2½—weight 22 lbs.—do. of an adult female 18 lbs.—

Pteropus edwardsii.

<i>P. medius</i> , Temminck; <i>Monog de Mam.</i> i. 173.			
Toggal Bawli,	CAN.	Guddal,	DRK.
Sikatyelle of Wuddurs,		Barbagal,	"

The flying-fox or large fox bat. Its flesh is esteemed good eating. Its tongue is covered with large papillæ, pointing backwards, and each one terminating in a brush or collection of bristly points. Length of the male, 12 to 13 inches—weight 29 oz.—of a female, 20 oz. Expanse of wings upwards of 4 feet. When disturbed during the day, they fly slowly round and round, with a low screaming noise, and soon settle again; hovering for a moment over a bough, they catch suddenly with the claw on the angle of the wing, and, allowing the body to drop, they swing with a single hold. In shade and colour, they are of a yellowish brown above, and yellowish white below.

MAMMALIA.

Pteropus marginatus, Fr. Cuvier.

Cynopterus marginatus, Temminck; *Monog de Mam.* 202.

Length, 4½ inch. Weight, 20x. a male. The dentition agrees with the statement of Fr. Cuvier, which he adopts as the character of his genus *Cynopterus*. Incisors 2 canines 1½ molars 1½ = 30. Is somewhat rare; found in clusters on the folded leaves of the plantain, the palmyra, &c.

Vespertilio carnatica?

Megaderma Carnatica. | M. Iym.

Kankapati,	CAN.	Shamgidar, Shab parak,	DRK.
------------	------	------------------------	------

Kankapati is the generic name in Canarese for all bats. This species differs from the dentition commonly assigned to *Megaderma*, in having incisors 2 canines 1½ molars 1½ = 24; whereas the molars according to Geoffroy are 1½. Above, mouse colour; beneath, paler. Nasal appendage large, oblong, reaching to the base of the ears, with a plait or fold down in the centre. Oreillon cordate, the anterior lobe high and pointed, the posterior rounded; the muzzle truncate, the under lip cleft. Four mammae. Female generally larger. Temminck states, *Mon. de Mam.* Tom. ii. p. 5, that the females and young of some bats live apart from the males at certain seasons, which may account for this.

	Female. inches.	Male. inches.
Length.....	3½	... 3
Expansion of wings.	19½	... 18
Ear (behind),	1½

Vespertilio Hardwickii.

Rhinopoma Hardwickii.

These were the largest dimensions ascertained from 14 females and 7 males, obtained at various times. They are common in the Mulnad, in old temples, caves, &c.

Weight... 10 drs. Male... 8 drs. 13 grs. Female.

Length of body, ... 2½ inches.

— tail, ... 2½

— carpus 2½

— tarsus 2½

Expanse of wings... 13.

This species has the muzzle long, thick, truncated and surmounted with a small leaf, oreillon oblong, bi-acuminated; forehead concave, with a fossa or channel running

MAMMALIA.

down the centre. The nostrils are placed in the truncated plane of the muzzle, being covered with a membrane slit transversely, and with a small round puncture in the middle of the slit. By means of this apparatus the animal is enabled to open or shut its nostrils at pleasure. The leaf-like process rises from the same plane of the muzzle. Found in old ruins to the eastward of the province.

Rhinolophus, Geoff. This, and the two following species, seem to form a subdivision of the section *Rhinolophus* (Geoffroy), differing in the number of teeth and having in common a remarkable peculiarity common to all, not included in his specific characters, which may be described as a circular cavity, or sac, behind the nasal crest. This cavity the animal can turn out at pleasure, like the finger of a glove; it is lined with a pencil of stiff hairs and secretes a yellow substance like wax. When alarmed, the animal opens this cavity and blows it out, during which it is protruded and withdrawn at each breathing. Temminck notices it under the name of a syphon, or purse in *R. Insignis* and *R. Speoris*. Dentition, incisors $\frac{1}{2}$; canines $\frac{1}{2}$; molars $\frac{2}{3}$ $\frac{2}{3}$ 28; whereas in Geoffroy's group the molars are $\frac{2}{3}$ $\frac{2}{3}$, and the total number 30. But Temminck makes them vary from $\frac{2}{3}$ to $\frac{1}{2}$. The upper incisors are distant, placed near the canines and triangular, broad at the edge and sloping to the root, the lower ones are close together, crenelate at the edge each having three points. In all other respects, the characters are the same as *Rhinolophus*. Nose furnished with a complicated crest. Ears distinct, marked with transverse distinct wrinkles. Interfemoral membrane large. Warts on the pubes.

Hipposideros speoris.

R. Crumenifere, Peron. | *Rhinolophus speoris.*

R. Marsupialis, Geoff. | *R. Dukhunensis, Sykes.*

Ears large, erect, acuminate, rounded to the base. Muzzle short, crest very complicated, consisting of a simple transverse membrane, or leaf extending between the eyes, behind which is the circular sac. In front is a cavity, in which are pierced the complicated nostrils, and surrounded by another smaller membrane; the upper portion next the frontal leaf thick and fleshy, the lower, above the lip, fine. On either side without this are three smaller parallel membranes or fringes, reaching from the eyes downwards. Body short, thick, of a light mouse colour. Interfemoral membrane, narrow, square, including the tail, which consists of about four joints, the half of the last joint being free at the point. Pubes naked,

MAMMALIA.

large, with one or two warts. Two pectoral mammae, two inguinal. Whether the latter are false or real is doubtful. It has been said they have no lacteal glands, but I have constantly remarked them, and that they are smaller in the young female. Females with the frontal sac less developed. On a comparison of about 18 specimens, the measurement of the largest was—

	Male.	Female.
Length.....	2 $\frac{1}{10}$ inches...	2 $\frac{1}{10}$
— of tail.....	1	1
— of exerted portion of tail.....	1 $\frac{1}{2}$ -10ths.	
— of ear.....	$\frac{1}{10}$	
— of carpus.....	2	
— of tarsus.....	$\frac{1}{10}$	
Expansion of wings ...	13	12 $\frac{1}{2}$
Weight.....	6 drs. 13 grs. 6 drs.	

Found in old buildings, wells, &c. The *R. Dukhunensis* of Sykes is said to differ from *R. Speoris* in the length of the carpus, but in Temminck, (*Monoy. de Mam. T. ii.*) p. 17, the fore arm is stated to be shorter than the whole length, and the difference of colour is not sufficient to constitute a specific difference.

Rinolophus murinus.

Hipposideros murinus.

Ears large, erect, rounded: muzzle short, with a transverse frontal leaf or membrane and the sac behind it as the last, and in front a simple membrane round the nostrils. Body short, and thick. Inter-femoral membrane large, including the tail, all but the extreme tip. Pubes small, covered. Mammæ as in the preceding, colour dusky brown, paler beneath.

Male.—Length 1 $\frac{1}{10}$; tail 1 $\frac{2}{10}$ —3 $\frac{1}{10}$; ear $\frac{1}{10}$; carpus 1 $\frac{1}{10}$; tarsus, barely $\frac{1}{10}$; expansion of wing 10 $\frac{1}{2}$; weight 4 drs. 20 grs.—The sexes nearly alike.—*Elliot M. L. S. J. July, 1839.*

Taphozous. Of this only one specimen was obtained.

Vespertilio proper.—Two small species are common, but neither of them have been identified.

Vespertilio sp. Ears small, sub-triangular, shorter than the head: oreillon oblong rounded, colour above, pale dusky brown, beneath lighter. Length 2 inches; tail $\frac{1}{10}$ —2 $\frac{1}{10}$; carpus 1 $\frac{1}{10}$; expansion of wing 10 inches.

Vespertilio sp. Smaller than the last, ears larger, rounded, nearly as long as the head. Oreillon curved and rounded at the end. Colour dark brown above and below. Length 1 $\frac{1}{10}$; tail $\frac{1}{10}$ —2 $\frac{1}{10}$; carpus 1; expansion of wings 7 $\frac{1}{2}$.

MAMMALIA.

Sorex Indicus, Geoff. Musk Rat or Shrew.

Sorex coruleaceus.

Sondeli, CAN. | Chachunda, DUK.

Ursus labiatus, Blainville.

Prochilus labiatus.

Kaddi; Karadi, CAN. | Beoch, DUK.
Aswal, MAH. |

The peculiar dentition of this animal, distinguishing it from the genus *Ursus*, has been remarked by Colonel Sykes. There are never more than 4 incisors in the upper jaw. Several crania agree in this peculiarity. Their food seems to be black ants, termites, beetles, fruit, particularly the seed of the *Cassia fistula*, of the date tree, &c., and honey. When pursued, they carry their cubs on their back. In 1833 a bear was chased and killed, having carried her two cubs in this manner nearly three miles. It appears to be a long-lived animal. Instances are known of their living in a state of captivity for 40 years.

Lutra Nair.—Fr. Cuvier. Indian Otter.

Nirnai, "water dog," CAN. | Hud or Hada, MAH. of
Datwai bekk Do. of the Wud- the Ghats.
dar tribo. | Jelmans and Jalman-
Pani kutta, "water dog") jar MAH.
DUK. |

Canon rutilans.

Canis familiaris, (wild variety.)

C. Dukhunensis, SYKES. | Jungli Kutta, DUK.

The wild dog was not known in the Southern Mahratta Country until of late years. It has now become very common. The circumstance of their attacking in a body and killing the tiger, is universally believed by the natives. Instances of their killing the wild boar, and of tigers leaving a jungle in which a pack of wild dogs had taken up their quarters, came to Sir Walter Elliot's own knowledge; and on one occasion a party of the officers of the 18th regiment, M. N. I. saw a pack run into, and kill, a large Sambar stag near Dharwar.

Canis pallipes. The wolf.

C. lupus, var. *ELL.*

Tola, CAN. | Landgah, DUK.

This species does not appear to differ from the common wolf. Three young ones which Sir W. Elliot had alive for some time agreed very much with the description of the *Canis pallipes* of Colonel Sykes, but several adults that he shot differed in their colours and general character. The head was large, the muzzle thicker, the colours in some cases more inclining to rufous, particularly on the fore legs; which in some cases were deep red; and the same colour was found on the muzzle from the eyes to the nose. Others have more rufous on

MAMMALIA.

the hind legs, together with some black on the thighs, rump, and tip of the tail. Length from muzzle to insertion of tail 36 to 37 inches; do. of tail 16 to 17½; height at shoulder 24 to 26; length of head 10; circumference of do. 16 to 17; weight of an adult female 42 lbs. The wolves of the Southern Mahratta country generally hunt in packs, chase the goat antelope (*Gazella arabica*), steal round the herd of Antelope cervicapra, and conceal themselves on different sides till an opportunity offers of seizing one of them unawares, as they approach, whilst grazing, to one or other of their hidden assailants. On one occasion, three wolves were seen to chase a herd of gazelle across a ravine, in which two others were lying in wait. They succeeded in seizing a female gazelle which was taken from them. They have frequently been seen to course and run down hares and foxes; and it is a common belief of the ryots that in open plains, where there is no cover or concealment they scrape a hole in the earth, in which one of the pack lies down and remains hid, while the others drive the herd of antelope over him. Their chief prey however is sheep, and the shepherds say that part of the pack attack and keep the dogs in play, while others carry off their prey; and that, if pursued, they follow the same plan, part turning and checking the dogs while the rest drag away the carcass, till they evade pursuit. Instances are not uncommon of their attacking man. In 1824 upwards of 30 children were devoured by wolves in the Pargunnah of Rone. Sometimes a large wolf is seen to seek his prey singly. These are called won-tola, and reckoned particularly fierce.

Canis aureus, Lin. The jackal.

Nari, CAN. | Kolah also Shighal, DUK.

The native sportsmen universally believe that an old jackal, which they call bhalu, is in constant attendance on the tiger, and whenever his cry is heard, which is peculiar and different from that of the jackal generally, the vicinity of a tiger is confidently pronounced. Sir W. Elliot says he has heard the cry attributed to the bhalu frequently.

Vulpes bengalensis.

Canis bengalensis, Shaw | C. Kokroo, SYKES.
and Pennant.

Konk, CAN. | Lomri; Nomri, DUK.
Kemp nari (red jackal), " Kokri, MAH.
Chandak nari, " "

Length from nose to insertion of tail 20 inches; do. of tail 14 in.; weight, male 7½ lb.; female 6½ lb.—both large specimens. Shaw's animal appears to be identical with

MAMMALIA.

the *Canis Kikree* of Colonel Sykes. Its principal food is rats, land crabs, grasshoppers, beetles, &c. On one occasion a half devoured mango was found in the stomach. It always burrows in open plains, runs with great speed, doubling like a hare; but instead of stretching out at first like that animal, and trusting to its turns as a last resource, the fox turns more at first, and if it cannot fatigue the dogs, it then goes straight away. It is remarkable that though the brush is generally tipt with black, a white one is occasionally found, while in other parts of India, as in Cutch, the tip is always white.

Viverra malaccensis.

Viverra Indica, Geoff. | *V. nase*, Horsf.
Puangin bekk, CAN. | Kasturi, MAH.
Mushk billi, DUK.

Length from the nose to insertion of tail 22 inches; do. of tail 15 $\frac{3}{4}$ in.—total 37 $\frac{3}{4}$ —weight 5 $\frac{1}{2}$ lb.—an adult female. Varies much in the distribution of the marks on the fur.

Mangusta mungus.

Herpestes griseus, DESM.

Mungli, CAN. | Mangoos, DUK.

There does not appear to be any difference between the *Mangusta mungus* and *Mangusta cafra*, both of which are referrible to the *Herpestes griseus* of Desmarest.

Mangusta vitticollis.

Herpestes vitticollis, Bennett, *Proceed. Zool. Soc.* 1835, Part iii. p. 67.

A specimen of this animal was procured in the thickest part of the glat forests by accident, in 1829, and is now deposited in the British Museum. It is very rare, inhabits only the thickest wood, and its habits are little known. Size the same as *M. grisea*, the animal was first figured in 1839.

Paradoxurus musanga.

P. typus.

Kora bek, CAN. | Menuri, DUK.

Common in the Muluad, living in trees, thatched roofs of houses and huts, &c.

Weight.....	380 lbs.	360 lbs.	240 lbs.

Nothing is more common than to hear of tigers of 12, 14, and even 15 feet in length. Most persons content themselves with measuring the skins of an animal after it is taken off; and Sir. W. Elliot once measured a lion of 9 feet 4 inches, which was noted by another of the party in his journal, as 11 feet: and by a third as 12—the one having measured the skin newly taken off and pulled out, the other when it was stretched to the uttermost by pegs to dry. He does not believe that any tiger has ever been known that would exceed ten feet. The female has from 2 to 4 young and does not breed at any particular season. Their chief prey is cattle, but they also catch the wild hog, the sambar, and, more rarely, the spotted deer. It is naturally a cowardly animal and always retreats from opposition until wounded or provoked. Several instances came to notice of its being compelled to relinquish its prey by the cattle in a body driving it off. In one case an official report was made of a herd of buffaloes rushing on a tiger that had seized the herd-boy and

MAMMALIA.

forcing it to drop him. Its retiring from the wild dog has already been adverted to. Though the wild hog often becomes its prey, it sometimes falls a victim to the successful resistance of the wild boar. Sir W. Elliot once found a full grown tiger newly killed, evidently by the rip of a boar's tusk; and two similar instances were related to him by gentlemen who had witnessed them, one of a tiger the other of a panther. It is generally believed that a tiger always kills his own food and will not eat carrion, but he met with one instance of a tigress and two full grown cubs devouring a bullock that had died of disease. He saw the carcass in the evening, and next day on the report of tigers having been heard in the night, he followed their track, and found they had dragged the dead animal into the centre of a corn-field and picked the bones quite clean, after which they found a buffalo, killed it, and eat only a small portion of it. Another instance was related in a letter from a celebrated sportsman in Kandesh, who having killed a tigress, on his return to his tents, sent a pad elephant to bring it home. The messenger returned reporting that on his arrival he found her alive. They went out next morning to the spot and discovered that she had been dragged into a ravine by another tiger and half the carcass devoured. They found him close by and killed him also. The Bheels in Kandesh say, that in the monsoon, when food is scarce, the tiger feeds on frogs, and an instance occurred some years ago, in that province, of one being killed in a state of extreme emaciation, from a porcupine's quill that had passed through his gullet and prevented his swallowing, and which had probably been planted there, in his attempts to make one of these animals his prey. Many superstitious ideas prevail among the natives regarding the tiger. They imagine that an additional lobe is added to its liver every year; that his flesh possesses many medicinal qualities; that his claws arranged together so as to form a circle, and hung round a child's neck, preserves it from the effect of the evil eye. That the whiskers constitute a deadly poison, which for this reason are carefully burnt off the instant the animals are killed. Several of the lower castes eat his flesh.

Felis pardus, Lin.

F. leopardus.		Leopardus varius.	
The large variety, Honiga, Tendowa, The panther, leopard or pard of the E. INDIES.	CAN. DUK.	The smaller variety, Kerkal, Gorbacha, Bibla, of the BAUKI.	CAN. DUK.
Assos,	MAHK.		

MAMMALIA.

Of this species there appear to be two varieties, a large and a small kind, though some are of opinion that the smaller animal is the leopard. Col. Sykes also distinguishes two kinds of cheeta, but considers the larger one to be the leopard. The natives distinctly recognize the two kinds by different names. Shaw says the leopard is distinguished from the panther by its paler yellow colour, and again that the leopard is considerably the smaller of the two. Here the paler is the larger. The most remarkable difference between these seems to be that of size, but on a careful inspection, other particulars are detected. An examination of a large collection of skins, gave the following characters: The large skins measured from $4\frac{1}{2}$ to 5 feet; the tail $2\frac{3}{4}$ — $7\frac{1}{2}$; the height appeared to be $2\frac{1}{2}$; the smaller ones were 3 to $3\frac{1}{2}$ ft. long; the tail $2\frac{1}{2}$ —6; the height was from $1\frac{1}{2}$ to 2. The colour of the larger skins was generally pale fulvous yellow, the belly white, whilst others were deeper and more tawny, some being a sort of reddish yellow, without any white at all, beneath. In the Kerkal there is also a great variety of shades. But generally a greater number of Honiga are pale coloured and of the Kerkal dark; whence probably the name of the latter from kera, dark or black. As a general rule too, the fur of the Honiga is shorter and closer; that of the Kerkal longer and looser. The character of the spots is always the same. They may be characterised as imperfect annuli, consisting of groups of spots, arranged in imperfect circles; but sometimes approximating more and becoming like trefoils: squares: or like the impression of a dog's foot, particularly along the dorsal line, and on the head, neck, shoulders, loins and legs. Where the ground colour is dark, the spots are more confused. The tail is without annuli, spotted throughout, but sometimes the spots run into each other at the end, giving the appearance of a black tip. The large variety is found chiefly among the rocky hills to the eastward, the smaller is more common in the wooded country of the Mulnad. The former is a taller, slighter, more active animal, exceedingly strong and fierce, the latter is smaller, and stouter, and varies much in size, some being not bigger than a large tiger-cat, though the skull proved them to be adult animals. The latter may be killed easily, while the Honiga is a very formidable assailant; and several instances occurred of as many as four men having been killed by one, before it was put hors de combat. The strongest marked difference of character that Sir W. Elliot

MAMMALIA.

observed, was in the skulls, that of the Honiga being longer and more pointed, with a ridge running along the occiput, and much developed for the attachment of the muscles of the neck—while those of the kerkal were rounder and the bony ridge was wanting. If this character be universal and permanent, it will afford a good ground of distinction. He was disposed to consider the Indian species as consisting of three varieties,

- (a). the larger or Honiga.
- (b). ditto of a uniform black colour, from the Malabar Coast, the spots appearing when the light shines strongly on the skin.
- (c). the smaller variety or kerkal.

The following are the dimensions of a very large honiga killed in the Mulnad: length of body from nose to insertion of tail 4 ft. 6 in. tail 3-2; in all, 7-8: height at the shoulder 2 ft. 3½ in. from ends of toes to top of shoulder 2-7; circumference of the arm below the elbow 1-3; head 1-11. This was a very large male called by the natives a Mar-honiga, stouter than the generality of the larger kind.

Felis—The Wagati, of the Mahratta of the Ghats, Sir W. Elliot was unable to identify with any of the species described. It seemed to him to differ both in size and colour from the *Felis viverrinus* sent to England by Mr. Heath, and described by Mr. Bennett. (*Proceed. Zool. Soc.* 1833, Part I. p. 68.) It is peculiar to the western ghut forests. It approaches most nearly to the *Felis tigrina* or Margay, Gr.; the *Felis Javanensis* or Kuwuk. Hore; and the *Felis diardi*. An

MAMMALIA.

adult male of the Wagati is 26 inches long, from the muzzle to the insertion of the tail, which is nearly 11 more—in all nearly 37 inches. The colour is pale yellowish grey—darker on the back—yellowish white or pale yellow on the sides—white on the under parts of the body. The forehead has 4 longitudinal spots. In a line with these, from the vertex, four lines run to the shoulders, the outer broader, the centre ones narrower, and these two last are continued almost uninterruptedly to the tail; the others break diagonally into large longitudinal spots, which are continued in rows of smaller rounder spots to the centre of the belly. There are about six rows on each side, exclusive of the two dorsal lines. Two smaller bands run from the eye, and along the upper lip, to a throat band running transversely below the ears. Two other similar transverse bands cross the breast with a row of spots between. The inside of the arm has two broad bands, and the soles are dark brown or nearly black. The tail is spotted on the upper half and indistinctly annulate towards the tip. It is very fierce—living in trees in the thick forests; and preying on birds and small quadrupeds. A shikari declared that it drops on larger animals, and even on deer, and eats its way into the neck; that the animal in vain endeavours to roll or shake it off, and at last is destroyed.

Mus. The different Indian species of this genus described are—

<i>Mus giganteus</i> , Hardw.	<i>Mus tytleri</i>
" <i>decumanus</i> Pallas	" <i>urbanus</i> .
" <i>rattus</i> ,....Lin.	" <i>bactrianus</i> .
" <i>platythrix</i> , Sykes.	" <i>brunneus</i> .
" <i>oleraceus</i> , Sykes.	" <i>brunneusculus</i> .
" <i>nitidus</i> .	" <i>caudator</i> .
" <i>niviventer</i> .	" <i>cervicolor</i> .
" <i>musculus</i> ,....Lin	" <i>crassipes</i> .
" <i>plurimamnis</i> .	" <i>darjeelensis</i> .
" <i>providens</i> .	" <i>homorous</i> .
" <i>rattus</i>	" <i>infra-lineatus</i>
" <i>rufescens</i> .	" and
" <i>terricolor</i> .	" <i>nilagiricus</i> .

Some of these are very numerous and troublesome.

The *Mus giganteus* of Hardwicke differs from the Florida rat, the type of *Neotoma* (as figured), in having the naved scaly tail of the common rat, whereas in the Florida species it is covered with hair.

The *Gerbillus Indicus* of Hardwicke unites both these characters, the surface of the molars being the same as that of two Indian species while the tail has the same peculiarity as the Florida rat, with the addition of a tuft at the extremity. But it is separated from the

MAMMALIA.

latter by the length of the hind foot, and the disposition of the toes, and by the carinated upper incisors; characters peculiar to Gerbillus. These common points of resemblance, however, show how intimately the different groups are connected and how gradually they pass into each other. The remaining species all belong to the group of *Mus* proper with tuberculated cheek teeth.

The species observed in the Southern Mahrattatta Country were—

With flat molars,

a. Scaly tails, short metatarsi (*Neotoma*).

Mus giganteus. | *Arvicola indica*.

b. With hairy tail; long metatarsi (*Gerbillus*).

Gerbillus indiens.

With tuberculated molars:

a. Covered with soft hair (*Mus*).

Mus decemmanus...*Lin.* | *Mus oleraceus*, *Sykes*.

„ *rattus*.....*Lin.* | „ *rufus*.....*New sp.*

„ *mettado* *New sp.* | „ *musculus*.....*Lin.*

„ *golandee* *New sp.* |

b. Covered with hair and spines.

Mus platythrix. *Sykes*. | *Mus boodaga*. *New sp.*

The first division have 3 molars in each jaw, with strong alveolar processes; the anterior or largest one divided into three sections by transverse ridges of enamel; the middle into two, and the third partly, or entirely so, as the centre ridge of enamel extends altogether, or only partly across the surface. In *M. giganteus* and *M. gerbillus* the enamel of the posterior molar of the upper jaw generally forms only a deep indentation. In *M. gerbillus* the incisors are more prismatic, the upper ones divided by a longitudinal furrow passing down the centre. In the other two species the incisors are smooth, rounded, with a longitudinal mark on the worn under surface. The upper incisors in *M. gerbillus* also are much more curved downwards than in the other two. In the former the usual and superior maxillary bones project considerably beyond the incisors; in the latter the incisors extend beyond these bones.

Mus (*Neotoma*) *giganteus*, *Hard. Lin. Trans.*—*Mus Malabaricus*, *Pennant, Quind.*

Hoggin, Can. | Ghons, Duk.
Pandi koku, Tel. |

The English name, bandicoot, is a corruption of *pandi-koku*, literally pig rat. It lives in granaries and stack-yards; feeds entirely on grain. Fierce, bold, easily killed. Makes a peculiar grunting noise when frightened or angry. Female with 12 teats. Incisors dark olive green at the base; becoming yellow at the extremities.

MAMMALIA.

Mus providens.—*Elliot*.

<i>Mus Indicus</i> ,	<i>Geog.</i>	<i>Arvicola Indica</i> ,	<i>Gray.</i>
„ <i>Kok</i> ,	<i>Gray.</i>	<i>Mus pycnoris</i>	<i>Hodgs.</i>
<i>Nesokia indica</i> ,	<i>Jerd.</i>		
<i>Kok</i> ,	<i>CAN.</i>	<i>Golatta Koku.</i>	<i>Tel.</i>
<i>Indian mole rat</i>	<i>ENG.</i>		

The Indian mole rat or provident rat is found throughout India ranging up to a considerable altitude. Geoffroy's animal is not sufficiently particularized to indicate which of the Indian species he meant; and Gray's was given under the supposition that it applied to an *Arvicola* which he subsequently discovered it did not: The present term seems sufficiently applicable to its habit of laying up a large store of grain for its winter food. The *koku* is from 13 to 14 inches in length, and weighs upwards of 6 oz. Its figure is thick and strong, with powerful limbs, the head short and truncated, the ears small, subovate or nearly round, and covered with a fine down or small-hairs. The tail naked and nearly as long as the body, whiskers long and full. Fur long and somewhat harsh, brown, mixed with fawn, the short fur softer and dusky. The colour generally being something like that of the brown rat, with more fawn or red intermixed, and lighter beneath. In its habits it is solitary, fierce, living secluded in spacious burrows, in which it stores up large quantities of grain during the harvest and when that is consumed lives upon the luryalee grass and other roots. The female produces from 8 to 10 at a birth, which she sends out of her burrow as soon as able to provide for themselves. When irritated, it utters a low grunting cry, like the bandicoot. Incisors entirely of an orange yellow colour. The dimensions of an old male were as follows:—length of body 7 inches; of tail $6\frac{1}{2}$; total $13\frac{1}{2}$; of head $1\frac{1}{6}$; of ear $\frac{3}{8}$ ths; of fore palm $\frac{1}{10}$ ths; of hind $2\frac{1}{8}$ ths. Weight 6 oz. 5 drs. The race of people known by the name of Wuddurs, or tank-diggers, capture this animal in great numbers as an article of food; and during the harvest they plunder their earthen of the grains stored up for their winter consumption, which, in favourable localities, they find in such quantities, as to subsist almost entirely upon it, during that season of the year. A single burrow will sometimes yield as much as half a seer (about a lb.) of grain, containing even whole ears of jowarce, (*Holcus sorghum*). The *koku* abound in the richly cultivated black plains or cotton ground but the heavy rains often inundate their earthen, destroy their stores and force them to seek a new habitation. He dug up a winter burrow in August 1833, situated near the old one, which was deserted from this cause. The animal

MAMMALIA.

had left the level ground, and constructed its new habitation in the sloping bank of an old well. The entrance was covered with a mound of earth like a mole-hill, on removing which the main shaft of the burrow was followed along the side of the grassy bank, at a depth of about 1 or 1½ foot. From this a descending branch went still deeper to a small round chamber; lined with roots and just large enough to contain the animal. From the chamber a small gallery ran quite round it, terminating on either side in the main shaft at the entrance of the chamber; and the passage then continued down to the bottom of the bank, and opened into the plain. Near the upper entrance, and above the passage to the chamber, was another small branch which terminated suddenly and contained excrement. But these burrows are by no means on a uniform plan. Another occupied by an adult female was likewise examined in the same neighbourhood. It was much more extensive, and covered a space of about 15 feet in length about 8 in breadth, also in a grassy mound, of which it occupied both sides. Six entrances were observed, (and there may have been more,) each covered with loose earth. The deepest part of the burrow near the chamber was about three feet from the surface, the chamber raised a little above the shaft, which terminated abruptly and was continued from the upper part of the chamber. The chamber lined with roots of grass and bark of the date-tree. The branching galleries, of which there were six, from the principal shaft, appeared to have been excavated in search of food. A variety found in the red soil is much redder in colour than the common koku of the black land. Another variety is said to frequent the banks of nullahs and to take the water when pursued, but except in size the specimens seen differed in no respect from the common kind of which they appeared to be young individuals.

Gerbillus Indicus, Hardw. Jerboa rat.

<i>G. Hardwickii</i> , Gray.	<i>G. cuvieri</i> Waterhouse.
<i>Harna mus</i> , HIND	<i>Tel-yelka</i> of YANADI.
<i>Jhenku indur</i> , SANS.	<i>Billa-ilei</i> CAN.
<i>Yeri Yeka</i> of WUDDUR.	

In the Jerboa rat, which occurs throughout India, the muzzle appears to be more pointed than is stated by General Hardwicke, who characterizes it as "very round," and the colour is always of uniform bright fawn, without any admixture of brown spots, which have never been observed. The incisors are always of a deep yellow colour; the eyes very large and full, the tail longer than the body. A large adult male measured:—length of body 7 inches;

MAMMALIA.

of tail 8½; of head 2½; of ear 1½; of fore foot 1½; of hind foot 2. Weight 6½ oz. They are said to be very prolific, bringing forth 16 to 20 at a birth but this seems an exaggeration, and the litter probably seldom exceeds 12. It is the common prey of foxes, owls, snakes. Lives in numerous societies, making extensive burrows in the red gravelly soil of the Mulnaad, generally in or near the root of shrubs or bushes. The entrances, which are numerous, are small, from which the passage descends with a rapid slope for 2 or 3 feet, then runs along horizontally, and sends off branches in different directions. These galleries generally terminate in chambers from ½ a foot to a foot in width, containing a bed of dried grass. Sometimes one chamber communicates with another, furnished in like manner, whilst others appear to be deserted and the entrances closed with clay. The centre chamber in one burrow was very large, which the Wuddurs attributed to its being the common apartment, and said that the females occupied the smaller ones with their young. They do not hoard their food, but issue from their burrows in the evening, and run and hop about, sitting on their hind legs to look round, making astonishing leaps; and, on the slightest alarm, flying into their holes. The Wuddurs eat this species also.

Mus decumanus, Lin.

<i>Manei ilei</i> , CAN	<i>Ghur ka chooha</i> , DEK.
<i>Choocha</i> , DEK.	

Not so common above the Ghats as below.

Mus rattus, Lin. Rare.

Mus lanuginosus.—Billot.

Golunda meltada Jerdon:

<i>Mettade</i> , of the WUDDUR.	<i>Kera ilei</i> , CAN.
---------------------------------	-------------------------

The name adopted to designate this species is taken from the word mettade, meaning soft in allusion to its fur, which is fine and soft—mettani meaning soft in Telugu. It is also called mettan-yelka, mettan-ganda, from the same cause. It is about half the size of the kok, which it somewhat resembles. The head is short, but the muzzle, instead of being square and truncated, is sharp; the ears are larger in proportion and more ovate. The general form is not so stout. The tail is shorter than the body. The colour above is reddish brown, with a mixture of fawn; lighter beneath, close and soft, with a few longer hairs projecting. A large adult male measured:—length of body, 5½ th inches; of tail, 4½ ths; total 9½ ths; of head 1½ th; of ear 0½ th. Weight 2½ oz. The mettade lives entirely in cultivated fields, in pairs, or

MAMMALIA.

small societies of five or six, making a very slight and rude hole at the root of a bush or merely harbouring among the heaps of stones thrown together in the fields, in the deserted burrow of the kok, or contenting itself with the deep cracks and fissures formed in the black soil during the hot months. Great numbers perish annually, when these collapse and fill up at the commencement of the rains. The monsoon of 1826 having been deficient in the usual fall of rain, at the commencement of the season, the metatades bred in such numbers as to become a perfect plague. They ate up the seed as soon as sown, and continued their ravages when the grain approached to maturity, climbing up the stalks of jowaree, and cutting of the ear to devour the grain with greater facility. Mr. Elliot saw many whole fields so completely devastated, as to prevent the farmers from paying their rents. The ryots employed the Wuddurs to destroy them, who killed them by thousands, receiving a measure of grain for so many dozens, without perceptibly diminishing their numbers. They are eaten by the Tank-diggers. The female produces from 6 to 8 at a birth.

Golunda Elliotti, *Jerd.* Bush-Rat.

<i>Mus hirsutus</i> Elliot.	CAN.	<i>Mus cofficus</i> , <i>Kelaart.</i>
Gulandi,		Sora-panji-gadur, <i>Tel.</i>
Gulat-yelka, of Wuddurs.		

The Gulandi is about the size of the last species, or a little larger—but differs from it in living entirely above ground, in a habitation constructed of grass and leaves, generally in the root of a bush at no great height from the ground, often indeed touching the surface. The head is longer than that of the Mettade, but the muzzle is blunt, rounded, and more obtuse, and covered with rough hair. The face and cheeks are also rougher than those of the other rats; the ears round and villous; the eyes moderate; the whiskers long and very fine. The tail naked and scaly, somewhat villous. The colour is an olive-brown above, mixed with fulvous; beneath yellowish tawny; sometimes paler, or light yellowish grey. A male Gulandi measured:—length of body, 6 $\frac{1}{2}$ th; of tail, 4 $\frac{1}{2}$ th; total 10 $\frac{1}{2}$ th; of head, 1 $\frac{1}{2}$ th; of ear, 0 $\frac{1}{2}$ th. Weight nearly 3 oz. The Gulandi lives entirely in the jungle, choosing its habitation in a thick bush, among the thorny branches of which, or on the ground, it constructs a nest of elastic stalks and fibres of dry grass, thickly interwoven. The nest is of a round or oblong shape, from 6 to 9 inches in diameter, within which is a chamber about 3 or 4 inches in diameter, in which it rolls itself up. Around and through the bush are

MAMMALIA.

sometimes observed small beaten pathways, along which the little animal seems habitually to pass. Its motion is somewhat slow, and it does not appear to have the same power of leaping or springing, by which the rats in general avoid danger. Its food seems to be vegetable, the only contents of the stomach that were observed being the roots of the hurayalee. Its habits are solitary (except when the female is bringing up her young), and diurnal, feeding during the mornings and evenings.

Mus oleraceus, Sykes.—Tree Mouse.

<i>Mus dumeticola</i> <i>Hodgs.</i>	CAN.	<i>Mus povenis</i> <i>Hodge.</i>
<i>Meina yelka</i> ,		<i>Marad ilei</i> ,

This species was designated as *M. longicaudatus* in the distribution list a term applied to it in Mr. Elliot's notes, some years ago, when he believed it to be undescribed, as in fact it was at the time, but it was subsequently noticed by Mr. Bennett from a specimen taken home by Colonel Sykes. [*Proceedings, Zool. Soc. July 26, 1832, p. 121.*] Its colour is a bright chestnut above, beneath pure white. Head moderate, muzzle somewhat obtuse, ears ovate, tail naked. The dimensions of a young female were:—length of body, 3 inches; of tail, 4 $\frac{1}{2}$ ths; total 7 $\frac{1}{2}$ ths; of head, 1; of ear, 0 $\frac{1}{2}$ ths. The *Meinalka* is extremely active and agile, and difficult to catch. He never procured its nest, but was told by the Wuddurs it lived always in bushes or trees, up which it is able to run with great facility. Colonel Sykes merely observes that "it constructs its nest of leaves of oleraceous herbs, in the fields." Whence the designation he has adopted for it.

Mus flavescens,—*Elliot*. This species somewhat resembles the last, but is nearly double the size, is of a paler yellow colour, and was met with only in out-houses and stables at Dharwar, but there are considerable numbers. Habits social. Its synonyms are Tree rat, *M. rufescens*; *M. arborens*; *M. brunneusculus*, and in Bengal *Gachua-indur*. This is a pale yellowish brown above, and white beneath. The head is long, the muzzle pointed, the ears very large, subovate. Dimensions of an adult male:—length of body 5 $\frac{1}{2}$ inches; of tail 6 $\frac{1}{2}$, total 12. Weight 12 $\frac{1}{4}$ oz.

Mus musculus, *Lin.* Common Indian Mouse.

<i>Mus dubius</i>	CAN.	<i>Mus manci</i> <i>Gray.</i>
		<i>Manci Bubnga</i> ,

Mr. Gray considered a specimen given to the British Museum to differ from the European species.

Mus platythrix, Sykes. | *Leggada platythrix*,

<i>Leggyade</i> , of Wuddurs.	CAN.	<i>Kal ilei</i> ,
<i>Kal yelka</i> ,		<i>Gijeli-gadu</i>

MAMMALIA.

The leggyade has also been described by Mr. Bennett from Colonel Sykes' specimen. *Proceedings, Zool. Soc. June 26, 1832, p. 121.* Sir W. Elliot proposed to call it *M. saxicola* as better expressive of its habits, and as being exactly equivalent to its native name; platythrix expressing a generic rather than a specific character. It has the head oblong, the muzzle pointed, the ears rather large, oblong, rounded. Incisors yellow. Colour light brown, mixed with fawn; beneath pure white; the white separated from the brown by a well defined pale fawn line. The flattened spines are transparent on the back, beneath smaller, and forming with a fur a thick close covering. The dimensions of an

	Adult Male.	Do. Female
Length of body.....	3 $\frac{1}{10}$ inch.	3 inches.
" of tail.....	2 $\frac{1}{10}$	2 $\frac{1}{10}$
Total...	5 $\frac{1}{10}$	5 $\frac{1}{10}$ or near- [ly 5 $\frac{1}{2}$
" of head.....	1 $\frac{1}{10}$	1 $\frac{1}{10}$
" of ear... ..	$\frac{1}{10}$	"
" of fore palm ..	"	" $\frac{1}{10}$
" of hind palm ..	"	" $\frac{1}{10}$
Weight.....	1 oz.	15 drs.

The leggyade lives entirely in the red gravelly soil, in a burrow of moderate depth, generally in the side of a bank. When the animal is inside, the entrance is closed with small pebbles, a quantity of which are collected outside, by which its retreat may always be known. The burrow leads to a chamber, in which is also collected a bed of small pebbles, on which it sits, the thick close hair of the belly protecting it from the cold and roughness of such a seat. Its food appears to be vegetable. In its habits it is monogamous and nocturnal. In one earth which he opened, and which did not seem to have been originally constructed by the animal but to have been excavated by ants, he found two pairs; one of which were adults, the other young ones about three parts grown. The mouth of the earth was very large, and completely blocked up with small stones; the passage gradually widened into a large cavity, from the roof of which some other passages appeared to proceed, but there was only one communication with the surface, viz. the entrance. The old pair were seated on a bed of pebbles, near which, on a higher level, was another collection of stones, probably intended for a drier retreat. The young ones were in one of the passages likewise furnished with a heap of small stones.

MAMMALIA.

Mus lepidus.—*Elliot.*

Badaga,	CAN.	Chitta barkani.	TEL.
Chit yalka,	TEL.	Chitta gauda,	"

This pretty little species resembles the preceding, but is only about one third of the size. The colour is similar, but paler, and it has the same pure white under surface, separated from the upper by an exact line. The spines are small, fine, transparent, and of a dusky tinge, tipped with fawn. The head is very long, being nearly one third the length of the body, and the muzzle pointed. The ears are large, ovate, naked. Incisors white. Tail naked, scaly. Limbs rather long, fine; the 3 middle digits of the hind foot produced, as in *Gerbillus*, the two outer ones much shorter and nearly equal. The dimensions of an old male were—length of body 2 $\frac{1}{10}$ th inch; of tail, 2 $\frac{1}{10}$ th; total 5 $\frac{1}{10}$ th; of head $\frac{1}{10}$ th; of ear 4 $\frac{1}{10}$ ths.; of fore palm 2 $\frac{1}{10}$ th; of hind palm $\frac{1}{10}$ th; weight 6 drs., but in general it does not exceed a $\frac{1}{4}$ of an oz. (or 4 drs.) Lives generally in pairs in the red soil, but sometimes a pair of young ones is found in the same burrow with the old ones. Does not produce more than 4 or 5 at a birth.

Alalu,	CAN.	Urta, of the	WUDDURS.
Gilheri,	DUK.		

The common species is sufficiently well known; the other, found only in the forests of the Ghats, is darker, the front and the back between the stripes reddish brown, the stripes small, narrower than in the common kind, and not extending the whole length of the back. The size of both is the same.—Length, 13 to 14 inches; weight of males, 4 oz. 12 drs.; females 4 oz. 11 drs. The young are born without any hair, but three dark lines are visible along the back indicating the position of the future stripes.

Sciurus Elphinstonii, *Sykes.* Bombay red squirrel.

Shekra,	MAH.	Kes Annalus,	CAN. of
		the Halapysks.	

Mr. Elliot observed the same uniformity of colour in the Ghat variety that has been described by Colonel Sykes; but it seems doubtful whether mere difference in colour, constitute sufficient grounds for the formation of a new species. He had both the black and the red kinds alive, and tame, in his possession, for months together, and he observed the most perfect similarity in their habits, cry, and in every particular except in that of colour. Though he never met with

MAMMALIA.

individuals of the *S. maximus* in the forest, he had often obtained them from the people of the country, who said they caught them in the Southern parts of the mountain range. The same disposition to vary in the shade and distribution of colour has been remarked by Dr. Horsfield in the Java congener of the Indian species, the Jeralang, or Leschenaults squirrel, a specimen of which has been described by Geoffroy as *S. Albiceps* from a casual difference of this kind. These varieties probably depend on locality, and have given rise to a great multiplication of species. Thus we have the *S. macrurus*: of Gmel., identified by Cuvier with *S. maximus* *S. ceylonensis* of Ray; *S. Indicus* said to come from Bombay, &c. Fischer makes the distinction between *S. maximus*, and *macrurus* to consist in the former having the cheek stripe terminating simply, while in the latter it is forked. J. B. Fisch. Syn. p. 363.

Pteromys Philippensis.—Elliot.

P. petaurista Pallas. | *P. oral* Tickell.

Pukhya, Pakyo, MAHR. | Oral. KOL.

Mr. Gray designated the specimens of this species presented to the British Museum by the specific name of *Philippensis*, and showed a former description of them under this title. It is the brown flying squirrel of Ceylon and the peninsula of India. The length of the male is 20 inches, and the tail 21 = 41 inches: that of the female 19, and the tail 20 = 39 inches. The colour above is a beautiful grey, caused by the intermixture of black with white and dusky hairs; beneath it is white, the legs and posterior half of the tail black. The male is distinguished by an irregular patch of rufous on the sides of the neck, which in the female is a sort of pale fawn. It is very gentle, timid, and may be tamed; but from its delicacy is difficult to preserve. Lives in the holes of trees in the thickest part of the forest.

Hystrix leucura, Sykes. Indian porcupine.

H. hirsutirostris, Brandt. | *H. Zeylanicus*, Blyth.

H. Cristata Indica, Gray, Hardw.

Dumsi,	NEPAL.	Yeddu pandi,	TEL.

There are three porcupines in the East Indies, *H. leucura* the Indian porcupine, *H. bengalensis*, the Bengal porcupine; and *H. longicauda*, the crestless porcupine of Nepal, Sikim, Burmah and the Malay peninsula. The porcupine of Europe is *H. cristata*,

MAMMALIA.

and that of Africa is *H. Africa Australis* of Pelers. *H. leucura* is found over a great part of India, from the lower ranges of the Himalaya to the extreme south but does not occur in Bengal. It forms extensive burrows, often in societies, in the sides of hills, banks of rivers and nullahs, in the bunds of tanks and in old mud walls, and they are very destructive to crops of potatoes, carrots and other vegetables. See *Hystrix*.

Lepus, the hare, of these there are five species known to inhabit the East Indies, *L. rufi caudatus*, the common Indian hare; *L. nigricollis*, the black naped hare, *L. hispidus*, the hispid hare; *L. penguensis* of Burmah, and *L. pallipes* of Tibet.

Manis, the pangolin genus, is represented in the E. Indies by *M. pentadactyla*, the Indian Scaly Ant-Eater, *M. aurita*, the Sikim Scaly Ant-eater, *M. javanica*, of Burmah, the Malay Peninsula and the Eastern Archipelago.

The manis burrows in the ground, in a slanting direction, to a depth of from 8 to 12 feet from the surface, at the end of which is a large chamber, about 6 feet in circumference, in which they live in pairs, and where they may be found with one or two young ones about the months of January, February, and March. They close up the entrance of the burrow with earth, when in it, so that it would be difficult to find them; but for the peculiar track they leave. A female that Mr. Elliot kept alive for some time, slept during the day, but was restless all night. It would not eat the termites or white ants put into its box, nor even the large black ant (*Myrmex indefessus*, Sykes) though its excrement at first was full of them. But it would lap the water that was offered to it, and also congee or rice water, by rapidly darting out its long extensive tongue, which it repeated so quickly as to fill the water with froth. When it first came it made a sort of hissing noise, if disturbed, and rolled itself up, the head between the four legs, and the tail round the whole. The claws of the forefeet are very strong, and in walking are bent under, so that the upper surface is brought in contact with the ground; its gait is slow, and the back is curved upwards. After its death a single young one was found in it (Sept. 15th), perfectly formed, and about 2 inches long. The marks

MAMMALIA.

of the future striated scales were distinctly visible, and its long tongue was hanging out. The tongue of the old one was 12 inches in length, narrow, flat fleshy to the tip, the muscle along the lower surface very strong. The length of the animal was 40 inches. The weight 21-lbs.

The Indian wild hog differs considerably from the German. The head of the former is longer and more pointed, and the plane of the forehead straight, while it is concave in the European. The ears of the former are small and pointed, in the latter larger and not so erect. The Indian is altogether a more active looking animal; the German has a stronger heavier appearance. The same differences are perceptible in the domesticated individuals of the two countries.

The different Indian names of Hippelaphus, Aristotelis, Equinus, are applied to the sambar stag, the great Indian stag, originally described by Aristotle under the designation of Hippelaphus, and discriminated as such by Mr. Duvaucel, in the Asiatic Researches, vol. xv. p. 174. The horns of different individuals present great diversities of form. The only common characters are those of a basal antler, springing directly and equally with the beam from the burr; and

MAMMALIA.

the beam terminating in a bifurcated extremity, formed by a branch or snag separating posteriorly and pointing obliquely to the rear. But Mr. Elliot met with instances of medial antlers, of trifurcated extremities, and in one case, with the extremity showing a fourfold division. The size of the Rusa is large, sometimes exceeding 14 hands in height. The colour varies from dark greyish black or slate-black; with the chin, the inner sides of the limbs, the under part of the tail, and the space between the buttocks, yellowish white, passing into orange yellow, but never extending into a large circular disk on the buttocks. In several instances he met with hind of a pale yellow or light chestnut colour. These were young individuals, but the shikaries always declared them to be the same as the common kind, and no other difference was perceptible. The cranium of one of these light coloured females presents no structural differences from that of a young black female. Both sexes have canine teeth in the upper jaw, springing from the suture between the maxillary and intermaxillary bones. The neck and throat are clothed with a long mane. The suborbital sinus is very large. When the animal is excited, or angry, or frightened, it is opened very large, and can be distended at pleasure. The new horns are soft and tender during the monsoon, from June to September, about which time the rutting season commences. The stags are then fierce and bold. Mr. Elliot has seen one, when suddenly disturbed, face the intruder for a moment, shaking his head, bristling his mane, distending the suborbital sinus and then dashing into the cover.

Chigri, CAN.	Phundayat, MAH.
Mriga, SANS.	Hurruon, MAH. DUK the doe.
Hurn, MAH. DUK the Buck	
Kalwoet, MAH, DUK.	

MAMMALIA.

The buck is the Alali, of the Baori or harn shikarees, called also Aravi-Chincher. They are a singular nomade tribe, who live entirely by capturing antelope by means of springes, in which they are very successful. They also catch the Chita (*Felis jubata*) for the Meer Shikaries. They wear a dress of a sort of brown coloured cloth peculiar to themselves, and speak a dialect of Hindi with a very singular intonation. Gundoli, of the Baori..... the Doe.

The Indian antelope frequents the black plains, in herds of sometimes 20 or 30, each of which has only one buck of mature age, the others being young ones. The buck of the herd always drives off the others, as soon as they begin to turn black, in the course of which desperate combats ensue, by which their horns are often broken.

The horns of the male in the Southern Mahratta country seldom exceed 19 or 20 inches. The longest seen were a pair of horns from Hyderabad, 24 inches long, with 5 flexures and 50 rings or annuli; and another pair from Kattowar which were 25 inches. The rutting season commences about February or March; but fawns are seen of all ages, at every season. During the spring months the buck often separates a particular doe from the herd and will not suffer her to rejoin it, cutting her off and intercepting every attempt to mingle with the rest. The two are also often found alone but on being followed always rejoin the herd. When a herd is met with, the does bound away for a short distance and then turn round to take a look—the buck follows more leisurely, and generally brings up the rear. Before they are much frightened they always bound or spring and a large herd going off in this way is one of the finest sights imaginable. But when at speed the gallop is like that of any other animal. Some of the herds are so large, that one buck has from 50 to 60 does, and the young bucks driven from these large flocks are found wandering in separate herds, sometimes containing as many as 30 individuals of different ages. They show some ingenuity in avoiding danger. In pursuing a buck once into a field of toor, Mr. Elliot suddenly lost sight of him and found after a long search that he had dropt down among the grain and lay concealed with his head close to the ground. Coming, on another occasion, upon a buck and doe with a young fawn, the whole party took to flight, but the fawn being very young, the old ones endeavoured to make it lie down. Finding however, that it persisted in running after them, the buck turned round and repeatedly knocked it over

MAMMALIA.

in a cotton field until it lay still, when they ran off endeavouring to attract his attention. Young fawns are frequently found concealed and left quite by themselves.

Antilope arabica. Hemprich and Ehrenberg. *Fischer's Synopsis* b 5. p. 460.

<i>Gazella benettii</i> , Jerd.	A. Bonnettii, Sykas.
Badari, CAN. of southern talooks.	Chikara, DEK.
Mudari, CAN. of northern talooks.	Porsya, of Baori, the Buck.
Tiska, CAN.	Chari, do. the doe.

The Indian gazelle inhabits all India except Bengal and the Malabar Coast, but is most abundant in the desert parts of Harriana, Rajpistanah and Sindh. Sir W. Elliot regards the *Antilope Arabica* and the *Gazella benettii* as identical. He says they abound in the islands of the Red Sea, particularly in Dhalak, and on the western shore about Massowa, and probably all along the Abyssinian Coast. The gazelle of the Hauran and of Syria, appeared to him also to be of this species. If this be the case, the Chikara possesses an additional interest, in being the same animal as the roe and the roe-buck of Scripture. The modern name for the gazelle in Yemen is Dabi or Dzabi which is the same as the Hebrew word translated "Roe." Dent. xiv, 5. It is likewise the gazelle of the Arabian poets, as appears from the common saying "The eyes of the Dabi are the most beautiful of all." It is found on the red sandy plains, or among stony open hills, and abounds in the basaltic formation of the Dekhan, in the valleys of the sand-stone formation, and generally among the jungles of the red soil to the eastward of the Southern Mahratta Country. It is never seen on the black plains, nor among the western jungles, nor in the Mulnad. It is found frequently in herds of three, generally a buck with two does; also of 5, 6, or more. The young expelled bucks are also found in separate herds like those of *A. cervicapra*. When two bucks fight they butt like rams, retiring a little and striking the foreheads together with great violence. When alarmed it utters a short hiss, by blowing through the nose and stamps with the fore-foot, whence its Canarase name of Tiska. The dimensions of an adult male procured at Dumbal in the Southern Mahratta country, were as follows: height at the shoulder 2 feet, 2 inches; at the crop 2 feet 4½ inches; length from the nose to insertion of the tail 3 feet 5½ inches; of tail 8½ inches; of ear 6 inches; of horns 11 in. of head 9 in. Weight 48 lbs. But these are by no means the largest dimensions observed. At Deesa in Gozerat, he measured three crania, the dimensions of the

MAMMALIA.

horns of which were length $10\frac{1}{2}$ in. $10\frac{1}{2}$ in. $11\frac{1}{2}$ inches.

The third or largest were very little lyratal; the 2nd were the strongest and thickest: he has also killed the buck weighing 51 lbs., the does weighed from 35 to 40 lbs. This is about half the weight of Cervicapra which varies from 90 to 100 lbs. The adult female has the horns inclining more to the rear, curved backwards, the tips forwards, slightly wrinkled at the base, the rest smooth and black, and nearly equidistant. In both, the lachrymatory sinus is small and black. There is a dark spot on the nose, and a line from the eyes to the mouth surmounted by a light one. Kneebushes, tail and fetlocks behind, black; chin, breast, and buttocks behind, white. Rest of the body, dark fawn, deeper where it borders the white on the sides and buttocks. Ears long, 3 ridges of hair along the inner surface. Inguinal pores, 2 mammae. Horns of the female sometimes with a few imperfect annuli, and never corresponding with each other.

In the Dekhan, this is much larger, and the colour varies considerably both from the Hindostan cikara, in which it is of a "uniform bright bay," and in the shades of individuals of different ages in the Dekhan. The spurious horns are so small, as rarely to be met with in adult individuals, and are situated on two osseous bumps or risings (strongly marked in the cranium) from which they seem to be easily detached. These osseous risings are immediately in front of the true horns, between the orbits, rather in front of a line drawn across the forehead through the centre of the eyes, and become covered with black callous skin, after the loss of the corneous tips. The true horns are situated behind the eyes or between the eyes, and the ears, inclining backwards with a scarcely perceptible curve forwards, straight, parallel, round, smooth, thick, and strong at the base which has a few wrinkles, and tapering to a point, their colour black. Those of very old males were $4\frac{1}{2}$ inches in length and had 3 strong wrinkles, and one imperfect one at the base. The dimensions of a young adult male were,

MAMMALIA.

height at the shoulder, 2 feet $1\frac{1}{2}$ inch: croup 2 feet, 3 inches, length from the muzzle to the insertion of the tail, 3 feet, 6 inches; of tail 5 inches; ear $4\frac{1}{4}$; horn 4; from the muzzle to the base of the horn, 6; of head 8; leg 1 foot 5 inches. Weight 42 lbs. The doe is about the same size and has no horns, nor any bony projection above the eyes. The mammae are four in number. The colour is brown, of various shades, not bright, but sometimes so light as to approach a dull fawn, darker than the Cervicapra, but not so bright and deep as in the gazelle. The shade is browner on the hind quarters, and darkest on the middle of the back. It becomes lighter on the sides till it passes gradually into white in the middle of the belly, without the well defined dark line of separation, observable in the other two species. The forelegs, particularly above the knee, the inside of the fetlocks, the nose and edge of the ears, are very dark. A narrow line between the fore-legs which gradually widens towards the hinder flanks, the inside of the arms and thighs, are white, as is the inside of the ear, in which the hairs are long, and arranged in indistinct ridges. The lachrymatory sinus is long, narrow and parallel with the line of the nose. In its habits, it is monogamous, and is always found in pairs, frequenting the jungles among the undulating hills of the Mulnad. It is never found in the open country, or among the hills on the eastern side of the district, neither does it ever penetrate into the western forests. The droppings are always observed in heaps in particular spots. It is said to be fond of licking the salt efflorescence of the soil, from which habit the incisors of old individuals are often found to be much worn, and sometimes wanting altogether.

It is found in the thick low jungles of the Rone and Chudi Pergunahs, in those of Goonjeelal near the junction of the Kistnah and Ghatparba rivers, the Mubilahal talook, and in the Moolwar Nala towards Beejapoor, but never in the open black plains, the Mulnad, or the Ghat forests. It is comparatively rare, and is becoming more so, every day. The country people are apt to confound it with the Sambar; but the localities frequented by the two animals are totally dif-

MAMMALIA.

ferent. The Sambur is impatient of heat, and requires shade and deep cover, the Neelgao is indifferent to the sun, and in the open plains, at noon, it requires a good horse and a long run to come up with it. The Neelgao drops on its knees to feed, and attacks and defends itself by butting with the head. The Sambur on the other hand never kneels and when irritated, rises on its hind legs, and strikes with the forefeet. In Goozerat the Neelgao is found in the open, grassy plains; the herd marches in a line, the bull leading with 8 or 10 cows following.

Jungli Khulga,	"	Pera Maoo,	S GONDI.
Hod at Seonic,		Katu yeni,	TAM.
Ban-parra, at Mundlah.		Urna,	"

This, the bison of sportsmen, is one of the largest animals of the Indian fauna, frequenting all the extensive forest tracts from Cape Comorin to the Himalayas, from Tinnevely, through the whole range of the Syhadree mountains up to Mahabeshwar, and near Vellore, in the Sherwaroyah hills near Salem, at Aseergurh, in Kandes, Rajahmundry, and is likewise to be found in all the deeper recesses of the eastern ghats, and on the banks of all the great rivers passing through them. An imperfect cranium which seems to belong to a female of this species, in the United Service Museum, is labelled thus: "Head of a Bison from Knddah, Straits of Malacca, presented by Lieut. Col. Frith, Madras Artillery." "It is called Gaviya by the Mahrattas, Jungli khoolga and Urna by the mahomedans (though it has not the slightest affinity with the buffalo to which both of these names apply), and Karkona by the Canarese, which is of similar import, from Kadu, a forest, and Kona, a buffalo. It differs also very remarkably from the common ox, and though it approaches considerably more to the description of the bison, the name generally applied to it by English sportsmen, it exhibits marked structural differences excluding it from the Bisontine group as defined by Cuvier. These consist in the plane of the fore-head being "flat and even slightly concave," and in the possession of only 13 pairs of ribs. It is not improbable that it will be found to constitute a connecting link between the Bisontine and Taurine groups. The most remarkable characters in the animal are an arched coronal, or convex

MAMMALIA.

bony ridge, surmounting the frontal bone, and projecting beyond it so as to make the line from the vertex to the orbit a concave sweep; the continuation of which from the orbit to the muzzle is slightly convex. The other distinctive mark is the prolongation of the spinous processes of the vertebrae of the back, from the withers to the loins where they cease abruptly. These processes are 12 in number and their prolongation gives the animals a very extraordinary appearance. The largest individual Mr. Elliot met with was killed in an island of the Kala Nuddee in the district of Soonda, in 1827. He relates that a noted shikaree, the Patel or headman of Alloor (a Hubshee or negro descendant of some of the numerous African slaves imported in the 15th century by the mahomedan kings of Beejaporo and who still exist as a distinct race, in this district), called him at day light and promised to show him one of the animals described by him as the wild buffalo. Crossing the river in a canoe, he struck into the forest and soon came upon a track, which he pronounced to be that of a large bull. On this he proceeded with the steadiness and sagacity of a blood hound, though it was often imperceptible to our eyes. At times when a doubt caused us to stop, he made a cast round, and on recovering the track summoned us to proceed by a loud whistle, or by imitating the cry of the spotted deer, for not a word was spoken, and the most perfect silence was enjoined. As we advanced he pointed silently to the broken boughs or other marks of the passage of a large animal, and occasionally thrust his foot into the recent dung, judging by its warmth of the vicinity of the game. We followed his steps for three miles to the river, then along the banks towards Dandelly, where the animal appeared to have passed to the other side. Wading across, we ascended the bank of a small island covered with thick underwood, and some large trees, amongst which it had lain down, about fifteen yards from where we stood. The jungle was so thick that we found it difficult to distinguish more than a great black mass among the underwood. On firing, the animal got on his legs, received two balls more, and rushed into the jungle where he became very furious, and we were obliged to shelter ourselves behind the trees, to avoid the repeated charges he made, though one ball through the shoulder which had broken the bone above the elbow, prevented his moving with facility. He then became exhausted and lay down snorting loudly and rising to charge when any one approached. A ball in the forehead caused him to roll over the precipi-

MAMMALIA.

tons bank into the river. Still however he was not dead and several balls were fired into his forehead, behind his ear and the junction of the head and neck without life becoming extinct, one ball which had struck the vertebrae of the neck was taken out almost pulverised. When drawn ashore and examined more minutely, the first sentiment produced in all present was astonishment at his immense bulk and 'ze but on measuring his height they found him much taller than his breadth at first led them to imagine. The head is very square and shorter than in the common ox, the forehead ample, the bony ridge rising about five inches in height from the plane of the frontal bone over which it inclines. When viewed behind it rises suddenly and abruptly from the nape of the neck, from whence to the vertex it measures seven inches, the horns make a wide sweep in continuation of the arched bony ridge, and turn slightly backwards and upwards forming an angle of about 35° with the frontal bone, the whole of the head in front, above the eyes, is covered with a coat of close short hair of a light greyish brown colour which below the eyes is darker approaching almost to black. The muzzle is large and full, and of a greyish colour, the eyes are smaller than in the ox, with a fuller pupil of a pale blue colour, the ears are smaller in proportion than in the ox, the tongue is very rough and covered with prickles, the neck is short, thick and heavy, the chest broad, the shoulder very deep and muscular, the forelegs short, the joints very short and strong, the arm exceedingly large and muscular. Behind the neck and immediately above the shoulder rises a fleshy gibbosity or hump, the same height as the dorsal ridge, which is thinner and firmer, rising gradually as it goes backwards and terminates suddenly about the middle of the back. The hind quarters are lighter and lower than the fore, falling suddenly from the termination of the ridge, the tail very short, the tuft only reaching down to the hocks. The dimensions of this individual were carefully noted as follows:

	feet.	in.
Height at the shoulder ..	6	1½
Do. at the rump (taken from hoof to insertion of tail),...	5	5
Length from the nose to the insertion of the tail, ...	9	6½
Do. do. to the end of the tail which was 2 feet 10 inches. ...	12	4½
Length of dorsal ridge including the hump, ..	3	4
Height of do. do. ...	0	4½
Girth (taken behind the forelegs)...	8	0

MAMMALIA.

	feet.	in.
Breadth of the forehead,...	1	3½
From the muzzle to the top of the arched bony ridge, ...	2	1¼
Distance between the points of the horns, ...	2	1
Circumference of horn at base, ...	1	7½
Between the roots of horns, ...	0	13½
Length of the ear, ...	0	10½
Circumference of the neck, ..	4	4

From the elbow to the heel, ...	2	7
Circumference of the arm, ...	2	6

The skin on the neck and shoulder and on the thighs is very thick and was about two inches in this one, which has already shrunk from lying in the sun. It is used for making shields which are much prized. On examining the skeleton picked clean by the vultures, he could only distinguish thirteen pairs of ribs. The cow differs from the male in having a slighter and more graceful head, a slender neck, no hump, a less defined dew-lap and the points of the horns do not turn towards each other at the points, but bend slightly backwards, the horns are smaller too, and the frontal bone narrower, but the coronal or ridge is distinctly marked. The bulls have the forehead broader in proportion to their age. In the young bull it is narrower than in the cow and the bony ridge scarcely perceptible. The horns too in the young specimen turn more upwards, the general colour is dark brown, the hair thick and short and in old individuals the upper parts are often rather bare. That on the neck and breast and beneath is longer, the skin of the throat is somewhat loose giving the appearance of a slight dew-lap. The legs are white with a rufous tint on the back and side of the forelegs. The skin of the under parts when uncovered is a deep ochrey yellow. The cow has the legs of a purer white. The breeding season is said to be early in the year and the calves are born after the rain. The bulls are often found separate from the herd which consists generally of from ten to fifteen cows and a bull. They generally feed during the night browsing on the young grass and the tender shoots of the bamboos of which they are very fond. In the morning they retire to some thicket of long grass or young bamboos where they lie down to ruminate. When disturbed the first that perceives the intruder stamps loudly with its foot to alarm the rest, and the whole rush through the

MAMMALIA.

forest breaking down every obstacle and forcing their way with a terrific crash,

dat euntibus ingens
Silva locum, et magno cedunt virgulta fragore
Æn. vii. 678.

When suddenly approached in the night they start off with a loud hissing snort. The Gowli race say they see great numbers of bison when pasturing their herds in the neighbouring forest. They describe them as very timid and watchful, more so than any other wild animal, always reposing in a circle with their heads turned outside, ready to take alarm. They add that they see most calves from June to October but the greatest number about August. They do not know how long the cow goes with calf, but suppose the period of gestation to be the same as that of the buffalo, or ten months and ten days. The old male drives the others from the herd at the breeding season, and the single ones seen in the jungle are young males of this description, and it is probable the very old bulls are sometimes expelled also by younger and stronger males. Mr. Fischer, of Salem, mentioned that the bison ordinarily frequents the Shervaroyah hills, seeking the highest and coolest parts, but during the hottest weather, and when the hills are parched by the heat, or the grass consumed by fire, the single families, in which they commonly range the hills, congregate into large herds, and strike deep into the great woods and valleys; but after the first showers, and when verdure begins to re-appear, they again disperse, and range about freely. In wet and windy weather, they again resort to the valleys, to escape its inclemency, and also to avoid a species of fly or gnat which harrasses them greatly. In the months of July and August, they regularly descend to the plains, for the purpose of licking the earth impregnated with natron or soda, which seems as essential to their well-doing as common salt is to the domestic animal when kept in hilly tracts. The chief food of the bison seems to be the following grasses and plants:

Yulanjan cordy.....	} A species of Saccharum used
Vallam pilloo.....	
Odeserengam pilloo.....	} Ricinus communis, Castor
The cottay moottoo	
leaf,	oil plant.
Mullum pilloo.....	} Anthystiria polystachia, Roeb.
Canavam pilloo.....	
	} Sorghum muticum, Wild cho-
Cheevum.....	} Broom grass, (Aristida).
Cattoo corangan leaf	
	} A species of Convolvulus, Ipo-
	} mea staphylina ?

but they will eat with avidity every species of grain commonly cultivated on the hills. The Bison particularly is so fond of the

MAMMALIA.

Araray cottay (Dolichos lablab, Ainslie); Country bean, when in blossom, that they will invade, and destroy fields of it, in open daylight, in despite of any resistance the villagers can offer. In other respects it is a very inoffensive animal, very rarely attacking any one it encounters, except in the case of a single bull driven from the herd. Such a one has occasionally been known to take up his location in some deep bowery jungle, and deliberately quarter himself on the cultivation of the adjacent villages. The villagers, though ready to assist Europeans in the slaughter of Bison, will not themselves destroy them (the inviolability of the cow extending to the Bison); and so bold does this free-roving animal become in consequence, that it has been known to drive the ryots from the fields, and deliberately devour the produce. But in general it is a timid animal, and it is often difficult to get within gun-shot of them. The period of gestation is with the Bison the same as with the domesticated animal; they drop their young in the months of September and October. It seems a slow growing animal. A calf he had for three years was evidently in every respect still a mere calf. They seem very difficult to rear. He had known it attempted at different ages, but never knew the animal to live beyond the third year. The calves he had, never became in any degree domesticated: the domesticated cow could never be induced to suckle them. The persevering ferocity of the bison of the Sub-Himalayan range, described by Mr. Hodgson, is quite foreign to the character of the animal in the southern forests. When wounded, it is true, it charges its assailant with determined courage, and in many instances causes much injury.

The following details exhibit the families, genera and principal species of mammals in the South and East of Asia.

ORDER PRIMATES.

Fam. SIMIADÆ, Monkeys.

Quadrumana.	Catarrhina, Geoffroy.
Macopithec, var Haren.	

Sub-fam. Simiina, Apes.

Troglodytes niger, Chimpanzee, Africa.
Troglodytes gorilla, Gorilla, Africa.
Simia satyrus, Orang-utan of Borneo.
Simia morio, Orang-utan of Sumatra.

Sub-fam. Hylobatina, Gibbons of Indo-Chinese countries and Malayana.

Hylobates hoolook, Hoolook of Assam, Cachat, Khassia, and Sylhet.
Hylobates lar, Gibbon of Tenasserim.

MAMMALIA.

Hylobates agilis, Gibbon of Malay peninsula, others from the Malay Islands.

Monkeys.

Gen. Presbytis Illiger.

Semnopithecus, *F. Cuvier.*

Hanuman, H. | Langur, H.

Presbytis entellus.

Simia, Dufren. | *P. anchises*, Ell.
Langur, H. | Makur, MAHR.
Hanuman, H. | Musyn, CAN.
Wanur, MAHR. | Bengal Langur, ENG.

common in Bengal and Central India.

Presbytis schistaceus, *Hodg. Horsf.*

Himalayan Langur, ENG. | Langur, HIND.
Kubur, BHOT. | Kambu Suhu, LEPU.

occurs throughout the Himalayas.

Presbytis priamus, *Ell., Bly., Horsf.*

Madras Langur, ENG. | Gaudangi, TEL.
inhabits the eastern side of the peninsula and the north of Ceylon.

Presbytis Johnii, *Jerdon.*

Simia Johnii, Fisher. | *Semnopithecus encellatus*, Is. Geoff.
Semnopithecus Dussut. | *Semnopithecus hypoleucos*, Blyth. Horsf.
Johnii, Schinz. |
var. of Martin.

The Malabar Langur, of Travancore, Cochin, Malabar and South Canara.

Presbytis jubatus, *Jerdon.*

Semnopithecus Johnii, *Wagner, Blyth, Martin.*

The Nilgherry Langur, of Nilgherries, Annamly, Palney and Wynad, not below 2,500 and 3,000 feet.

Presbytis pilatus, *Blyth.*, Sylhet, Cachar, Chittagong.

Presbytis barbei, *Blyth.* interior of Tipperah Hills.

Presbytis obscurus, *Reid.*, Mergui.

Presbytis phayrei, *Blyth.*, Arakan.

Presbytis albo-cinereus, Malayan Peninsula.

Presbytes cephalopterus, *Blyth*, Ceylon.

Presbytes ursinus, *Blyth*, Ceylon.

Sub-fam. Papioninae, Baboons.

The true baboons of Africa and monkey-like baboons of India.

Inuus silenus, *Jerdon.* Lion-monkey.

Simia leonina, *Linnaeus, Shaw.* | *Silenus veter*, *Gray, Bly. Horsf.*

Nil-bandar, BENG. | Nella-manthi, MAL.
Siabbandar, HIND.

W. Ghats, Cochin, Travancore.

Inuus rhesus, *Jerdon.*

Inuus erythreus, *Schreb.* | *Pitheciopsis*, *Hodg. Horsf. Bl.*

MAMMALIA.

Bengal monkey, ENG. | Marcut-banur, LEF.
Bandar, HIND. | Banur, "
Morkot, BENG. | Suhu, "
Piyu, BHOT. "

Inhabits nearly all India.

Inuus pelops, *Jerdon.*

Macacus Assamensis, *McLelland, Horsf. Blyth.*

The Hill monkey, high up on the Mussoorie Hills.

Inuus Sikkimensis, *Jerdon.*

Macacus Sikamensis, *Hodgson.*

Inuus nemestrinus, *Jerdon.* Tenasserim and Malaya.

Inuus leoninus, *Blyth.* Arakan.

Inuus arctoides, *Is. Geoffroy.* Arakan.

Gen. Macacus radiatus, *Jerdon.*

Simia sinica, *Linnaeus, Ell. Bly. Horsf.*

Mungu, CAN. | Wanur, MAHR. of SIKES.
Madras Monkey, ENG. | Korda, MAHR. of GHATS.
Bandar, H. | Koti, TEL.
Makadu, MAHR. | Vella Munthi, TAN.

All over Southern India.

Macacus pileatus, *Shaw*, of Ceylon.

Macacus carbonarius, *F. Cuvier*, of Burmah.

Macacus cynomolgus, *Linnaeus*, of Burmah.

Fam. LEMURIDÆ. The Lemurs, mostly of Madagascar, one genus of Africa and two or three from India and Malaya.

Nycticebus tardigradus, *Jerdon.*

Stenops Javanicus, *Auctor.* | *N. Bengalensis*, *Geoph. Horsf. Bly.*

Slow paced Lemur, ENG. | Lajawoti banur, BENG.
Laja banur, BENG. | Sharmundah billi, HIND.

Found in Bengal, Rangoon and Dacca.

Nycticebus javanicus, *Blyth*, of Java.

Loris gracilis, *Jerdon.*

Lemur Ceylonicus, *Fischer, Blyth.*

Ternagar, TAN. | The slender lemur, ENG.
Dewanti pilli, TEL. | Sloth, of MADRAS.

Found in Ceylon, and Southern India.

Tarsium a genus of Java.

Fam. GALEOPTHECIDÆ, Flying Lemurs.

Gen. Galeopithecus, natives of Malaya.

SUB-ORDER. CHEIROPTERA, Bats.

Fam. PTEROPODIDÆ, Frugivorous bats.

Many of the *Pteropus* bats inhabit Malaya, Ceylon, India, Burmah, Malacca, Java.

Pteropus Edwardsi, *Jerdon.*

P. medius, *Tenn.* | *P. Assamensis*, *McLelland*
P. leucocephalus, *Hodg.* | *Ell. Blyth.*

MAMMALIA.

Badul, Beng. | Bar-bagol, Hind.
Togglul bawali, Can. | War-baggul, MAHR.
Large Fox bat, Eng. | Sikat yelli, TEL.
Flying fox, H. | Siku rayi, "
Gadal, H.

Found in Ceylon, India and Burmah.

Pteropus Leschenaultii, *Jerdon*.

Pt. semimundus, *Kelaart*. | Fulvous Fox-bat, Eng.
Madras, Carnatic and Trichinopoly.

Pteropus edulis, Java, and Malacca.

Pteropus Dussmieri, *Is. Geoff.* continent of India?

Cynopterus marginatus, *Jerdon*.

Pteropus pyrivornis, | *P. tittecheilus*, *Temm.*
Hodgson. | *Ell Bly Horsf.*

Cham gadili, Beng. | Small Fox bat, Eng.

Throughout all India and Ceylon.

Cynopterus affinis, *Gray*, Himalaya, a synonym of *C. marginatus*.

Macroglossus minimus, *Jerdon*.
Pteropus minimus.

Tenasserim and Malayana.

Fam. VAMPIRIDÆ.

Sub-Fam. Megadermatinae.

Megaderma lyra, *Jerdon*.

M. Carnation, *Ell*. | *M. schistacea*, *Hodgs. Bly. Horsf.*

Large eared Vampire bat, over all India.

Megaderma spectrum, *Jerdon*. Cashmere Vampire bat.

Megaderma Horsfieldii, *Blyth*, of Tenasserim.

Megaderma spasma, *Linn*. Ceylon and Malayana.

Sub-fam. Rhinolophinae, Leafy nosed bats.

Rhinolophus perniger, *Jerdon*, *Hodg. Blyth*.

R. luctus, *Temm.* | Large leaf bat. Eng.

Nepal? Malabar? Java? Darjeeling.

Rhinolophus mitratus, *Blyth*.
Mitrated leaf bat. Eng.

Chybassa, Mussuri? Central India.

Rhinolophus luctus, *Horsf.* Java.

Rhinolophus tragatus, *Hodg. Blyth*.
Dark brown leaf bat. Eng.

Nepal, Mussoorie.

Rhinolophus Pearsoni, *Horsf. Blyth*.
Pearsons leaf bat. Eng.

Darjeeling, Mussoorie.

MAMMALIA.

Rhinolophus affinis, *Horsf. Blyth*.

R. rubidus, *Kelaart*. | *R. cinerascens*, *Kelaart*.
Allied leaf bat. Eng.

Malabar? Ceylon, Burmah, Malayana.

Rhinolophus rouxi, *Tem. Blyth*.

R. lepidus, *Bly.* | Rufous leaf bat, Eng.

Malabar, Calcutta, Colgong, Mussoorie.

Rhinolophus macrotis, *Hod. Bly*.
Large eared leaf bat. Eng.

Himalaya, Nepal, Mussoorie.

Rhinolophus subbadins, *Hodg. Blyth*.
Bay leaf bat. Eng.

Nepal, Himalaya.

Rhinolophus brevitaris, *Bly.* Darjeeling.

Several species of *Rhinolophus* occur in the Malayan islands, China and Japan.

Hipposideros armiger, *Hu. Bu*.

H. nobilis, var. *Blyth*. | Large horse-shoe-bat, Eng.
Nepal, Mussoorie, Darjeeling.

Hipposideros lankadeva, *Kel.* Ceylon.

Hipposideros nobilis, *Cantor*. Burmah, Ceylon and Malay peninsula.

Hipposideros speoris, *Bl. El*.

H. apiculatus, *Gray* | *H. dukhunensis*, *Sykes*.
H. penicillatus, " | Indian Horse shoe-bat. Eng.

India generally, Ceylon, Archipelago.

Hipposideros cinerascens, *Bly*.
Ashy horse-shoe-bat. Eng.

Punjab, Salt Range.

Hipposideros murinus, *Jerdon*.
Rhinolophus fulgens, *Ell. Blyth*.
Little horse shoe-bat.

S. India, Ceylon, Nicobars, Burmah, Malayana.

Hipposideros larvatus, *Horsf.* Burmah, Malayana, Sylhet.

Hipposideros insignis, *Cantor*. Malay Peninsula.

Hipposideros nobilis, *Cantor*. Malay Peninsula.

Hipposideros diadema, *Cantor*. Malay Peninsula.

Hipposideros galeritus, *Cantor*. Malay Peninsula.

Coelops Frithii, *Bly*. Tailless bat of Sunderbans.

Rhinopoma Hardwickii, *Gray, Blyth*. The long tailed leaf-bat of all India, Burmah, Malayana.

Nycteris Javanica, *Geoff.* Java, Malacca.

Fam. NOCTILIONIDÆ.

Sub-Fam. Taphozoinæ.

MAMMALIA.

Taphozous longimanus, *Hard. Blyth.*
T. brevimanus, *Blyth.* | *T. fulvidus*, *Blyth.*
T. cantori, *Blyth.*
The long-armed bat of all India.
Taphozous melanopogon, *Temm. Horsf.*
The black bearded bat of Canara, Malayana.
Taphozous saccolaimus, *Temm. Blyth.*
T. crassus, *Blyth.* | *T. pulcher*, *Elliot.*
The white-bellied bat of Madras, Malayana.
Taphozous bicolor, *Temm.* E. Indies?
Emballonura species from Java.
Sub-fam. Noctilioninae.
Nyctinomus plicatus, *Jerdon.*
Vespertilio plicatus, *Buck. Bly.* | *N. dilatatus*, *Horsf.*
N. bengalensis, *Geoff.* | *N. tenuis*, *Horsf.*
The wrinkled lip-bat of Madras, Calcutta.
Cheiromeles torquatus, of Java.
Fam. VESPERTILIONIDÆ.
Sub-fam. Scotophilinae.
Scotophilus serotinus, *Jerdon.*
Vespertilio noctula, *Geoff.* | Silky bat, *Eng.*
" *serotinus*, *Schr.*
Europe, Himalaya, Tyne range beyond Mussoorie.
Scotophilus leisleri, *Jerdon.*
Vespertilio dasycarpus *Leisleri*, *Blyth.*
Hairy armed bat and the Tyne Range, of the Himalaya.
Scotophilus pachyomus, *Jerdon*, the thick muzzled bat of India?
Scotophilus Coromandelianus, *Jerd.*
Kerivoula Sykesii, *Gray. Ell.*
The coromandel bat of all India.
Scotophilus lobatus, *Jerd.*
Vespertilio abramus, *Temm.*
The lobe-eared bat of India.
Scotophilus fuliginosus, *Jerd.*
Nycticejus atratus, *Blyth.*
The smoky bat of Nepal.
Scotophilus fulvidus, *Ell. Tenasserim.*
Scotophilus pumiloides, China.
Noctulinia noctula, *Gray.*
Vespertilio lasiopterus, *Sch.* | *V. labiata*, *Hodg. Bly.*
V. altivolans, *White.*
The noctule bat of England, Nepaul.
Flies high.
Nycticejus heathii, *Horsf. Bl.*
Large yellow bat, *Eng.*
Southern and Central India.

MAMMALIA.

Nycticejus luteus, *Blyth.*
N. flaveolus, *Horsf.* | Bengal yellow bat, *Eng.*
All India, Assam, Burmah.
Nycticejus Temminckii, *Jerd.*
Vespertilio belanger, *Geoff.* | *V. noctulinus*, *Is. Geoff.*
The common yellow bat of India, Burmah, Malayana.
Nycticejus castaneus, *Gr. Bly.*
Chesnut bat, *Eng.*
Bengal, Burmah, Malayana.
Nycticejus atratus, *Blyth.*
Scotophilus fuliginosus, *Bly.* | Sombre bat, *Eng.*
Darjeeling.
Nycticejus canus, *Blyth.*
Sc. Madras-patanus, *Gray.* | Hoary bat.
All India.
Nycticejus ornatus, *Blyth.*
Harlequin bat, *Eng.*
Darjeeling.
Nycticejus nivicolus, *Hod. Horsf.*
Alpine bat, *Eng.*
Near the snows of Sikkim.
Sub-Fam. Vespertilioninae.
Lasiurus Pearsoni, *Horsf. Bl.*
Noctulinia lasiura, *Hodgson.*
The hairy winged bat of Darjeeling.
Murina suillus, *Jerd.*
N. lasiura, *Hodg.* | *L. Pearsoni*, *Bl.*
The pig bat of Darjeeling, Malayana.
Murina formosa, *Jerd.* The beautiful bat.
Vespertilio, *Hodg.* | *Nycticejus Tickelli*, *Blyth.*
Kerivoula, *Gray.* | *N. isabellinus*, *Horsf.*
Central India, Nepal, Sikkim, Darjeeling.
Kerivoula picta, *Jerd.*
Vespertilio kerivoula, *Boddaert* | Painted bat, *Eng.*
All India, Burmah, Malayana.
Kerivoula pallida, *Blyth.* The pale painted bat of Chybassa.
Kerivoula papillosa, *Jerd.* The papillose bat of Ceylon, Calcutta, Java, Sumatra.
Kerivoula tenuis ? *Tomes.*
Vespertilio tenuis.
Java, Sumatra.
Kerivoula hardwickii, *Tomes.*
Vespertilio Hardwickii.
Java, Samatra.
Vespertilio caliginosus, *Tomes.*
Mustached bat, *Eng.*
India.

MAMMALIA.

Vespertilio ailigorensis, *Hodg. Horsf.*

Teral bat, *Eng.*

Siligoree in the Sikkim Terai.

Vespertilio darjilingensis, *Hodg.* The Darjeeling bat, is like *V. mystacinus* of Europe.

Vespertilio Blythii, *Tomes.* Nasserabad.

Vespertilio advorsus, *Blyth.* Horsf.

Malayan bat, *Eng.*

Ceylon, Calcutta, Burmah.

Vespertilio Horsfieldi, *Temm.*

V. tralatitans, *Horsf.*

Malayan peninsula and Java.

Vespertilio tralatitans, *Temm.* of the Malayan peninsula and Java.

Myotis murinus, *Jerd.*

Vespertilio murinus, *Geoff.* | Mouse like bat, *Eng.* Europe, Mussoori.

Myotis Theobaldi, *Blyth.*

M. pallidiventer, *Hodg. Blyth.*

Theobald's mouse bat of Cashmere.

Myotis parvipes, *Blyth.*

M. pipistrellus, *Bly.*

Small footed mouse bat of Mussoorie.

Myotis lepidus, *Blyth.* Candahar.

Myotis berdmorei, *Blyth.* Tenasserim.

Plecotus auritus, *Jerd.*

Pl. homochrous, *Hodg.* | *Pl. Darjilingensis*, *Hodg.* Long eared bat, *Eng.*

Darjeeling.

Plecotus timorensis, *Geoff.* Timor.

Barbastellus communis, *Gr. Bl.*

V. barbastellus, *Schreb.* | *B. daubentonii*, *Bell.*

The barbatello bat of Himalaya, Mussoori, Nepal.

Barbastellus leucomelus, *Jerd.*

V. leucomelus, *Ruppell.*

Red Sea.

Barbastellus macrotis, *Jerd.*

V. macrotis, *Temm.*

Sumatra.

Nyctophilus Geoffroyi, *Bl.* Leach.

The large eared leaf bat of Europe, Australia, Mussoorie.

ORDER INSECTIVORA. Insectivorous Mammals.

Fam. TALPIDE, Moles.

MAMMALIA.

Talpa micrura, *Hodg. Blyth.*

T. cryptura, *Blyth.*

Pariam,

LEP. | *Biya kanyom*,

BROT.

Nepal, Sikkim.

Talpa macrura, *Hodg.*

Long tailed mole, *Eng.*

Sikkim.

Talpa leucura, *Blyth.* Sylhet, Tenasserim.

Talpa mogura, *Temm.* Japan.

Urotrichus talpoides, Japan.

Fam. SORECIDÆ, Shrews.

Sorex caeruleus, *Sav. Blyth.*

Sorex Indicus,

S. Sonnerati,

Geoff.

S. giganteus,

S. myosurus,

typical carnivora, very quick and speedy.
Fam. FELIDÆ or Cat tribe, lions, tiger,
leopards, cats and lynxes.
Five, the lion, pard, cheeta, chaus or wild
cat, and the Caracal or lynx, are common to
Africa and India.
Seven, the tiger, pard, clouded leopard,
marbled tiger cat, large tiger cat, leopard
cat and bay cat, are common to India,
Assam, Burmah and Malayana, and three of
the seven, viz., the clouded cat, marbled cat
and bay cat occur in the S. E. Himalaya.
One, the ounce, is an outlayer of Central
Asia: and only three, the *F. jerdoni*, *F.*
rubiginosa, and *F. torquata*, appear peculiar
to the peninsula of India.
Gen. Felis leo, *Linn.* The Asiatic lion.

Man, a derivative root, means to think. From this we have the Sanscrit manu, originally thinker, then man. In the later Sanscrit we find derivatives, such as māna-va, mānusha, manushya, all expressing man. In Gothic we find both man, and manniaks, and in the Modern German mann and mensch. Leibnitz and Lapepe divide the human race into Europeans, Laplanders, Mongols and Negroes; Linnaeus into white, red, yellow and black:—Kant into white, copper-coloured, black and olive-coloured races; Blumenbach into Caucasians, Ethiopians, Mongols, Americans and Malays; Buffon into Northern (viz. Laplander), Tartarian, South Asiatic, Black, European, and American races; Prichard into Iranian (also Indo-Atlantics or Caucasians), Turanians (Mongolians), Americans, Hottentots and Bushmen, Negroes, Papuas (or wool-haired tribes of Polynesia), and Alforous (or Australians); and Pickering divides them into Whites,

Mongolians, Malays, Indians, Negroes, Ethiopians, Abyssinians, Papuans, Negritos, Australians and Hottentots. Many of these classifications are framed from external, and for the most part unessential, marks of distinction, as colour of the skin, colour and form of the hair, or with reference to their probable original geographical position. But the imperfectness of such a classification will be evident when it is remembered that a negro, even though the colour of his skin and his woolly hair were to be changed, would not become a European, an Indian or a Malay; and a child of European parents begotten and born on one of the isles of the Malayan Archipelago or in Ethiopia will not be a Malay or an Ethiopian, but an European, by race, although the colour of its skin might possibly approach, by climatorial or local influences to that of the indigenous race. The question whether mankind consists of one or of several species, has of late years been much agitated by anthropologists, but those naturalists who admit the principle of evolution though they may, for the sake of expressing their amount of difference, designate them as distinct species, nevertheless feel no doubt that all the races of man are descended from a single primitive stock. Virey held that there were six species or races; Jacquinot, three; Kant, four; Blumentack, five; Buffon, six; Hunter, seven; Agassiz, eight; Pickering, eleven; Bory St. Vincent, fifteen; Desmoulins, sixteen; Morton, twenty-six; Crawford, sixty; and Burke, sixty-three. But although the existing races of man differ in many respects as in colour, hair, shape of skull, proportions of the body, yet if their whole organizations be taken into consideration, they are found to resemble each other in a multitude of points. Europeans and Hindoos, belong to the same Aryan stock and speak a language fundamentally the same, but they differ widely in appearance which is supposed by Broca to have arisen, through the Aryan branches, having, during their wide diffusion been largely crossed by various indigenous tribes. In the East Indies where amongst Hindoos the system of caste prevails and keeps each sub-species distinct, the Scythic Jut, the Rajput, the Brahmin, the Turanian and helot races are seen to vary from the black squat tribes of the mountains to the tall olive coloured brahman with his intellectual brow, calm eyes, high but narrow head, and in the further Indies the Burman, the Malay, the Negrito, or Negro, and Papuan are all at once distinguishable. Amongst Indian mahomedans, too, obtained from Arabia, Persia, and Scythia, and converts from hin-

doism where they have not intermarried, the distinctions are very marked.

Man was long supposed to have existed in the earth, since about six thousand years, but it is now established that man has existed from an incomparably greater period. The world appears as if it had long been preparing for the advent of man. At the present day, even the most distinct races of man, with the exception of some negro tribes, are much more like each other than is generally supposed. In India, a newly arrived European cannot at first distinguish the various native races, though they soon appear to him extremely dissimilar, and the natives of India cannot at first perceive any difference between the men of several European nations. There are, however, marked distinctions. The Mongolian, the Negro, the Australian and the Hottentot differ in a multitude of characters, some of slight some of considerable importance, and are undoubtedly distinct species of the family of man, the negroes of the present day being of the same form as those of 4000 years ago. The Malays and Papuans who live under the same physical conditions, differ greatly. The different races of man are distributed over the world in the same zoological provinces as those inhabited by distinct species and genera of mammals. This is manifestly the case with the Australian, Mongolian and Negro races of man; in a less marked manner with the Hottentots, but plainly with the Papuans and Malays, who are separated by nearly the same line which divides the great Malayan and Australian provinces. The different species, however, mingle together and produce progeny with mixed characters. In Brazil is an immense mongrel population of Negroes and Portuguese. In Chiloe and other parts of S. America, the whole population consists of Indians and Spaniards blended in various degrees, and with complex crosses of Negroes, Indians and Europeans. Capt. Burton observes that the mixture of French with Indian blood produces a favourable progeny, but that the offspring of the Portuguese and of Natives of the East Indies is coarse, and dark coloured. In S. America on the contrary, the offspring of the Portuguese and Indians are often fairer and never darker than that of the Indian. In one island of the Pacific is a small population of mingled Polynesian and English blood; and in the Viti Archipelago, is a population of Polynesians and Negritos crossed in all degrees.—*Darwin, Animals and Plants. Report Brit. Association. Darwin, Origin of Species, Bopp. Glossarium Sanscritum, s. v. Muller's Lectures, p. 367-368.*

MAN.

MAN, BENG. *Colocasia Indica*.

MAN, AR. HEB. HIND. TAM.

Maund, Mannah,	ENG. HBS.	Maungu, Mahana,	TEL. URIA.
A measure of weight, amongst the Hebrews and now in India, varying in quantity according to locality and the article weighed.			
Bengal bazaar man	=	40 seers=	lbs. 82
" Factory man	=	lbs. 74, oz. 10, grs. 10.6	
Central India "	=	"	20
Guzerat "	=	"	40 of less value
Bombay "	=	"	28 avoirdupois
Southern India "	=	"	25
Bengal man of 1833	=	lbs. 87½	"
Akbars "	=	"	34½
Mysoore "	=	"	163
Hebrew man or Mannah	=	13,125 grains or	lbs. 1.14

The ser of opium is 2500 gra.

The ser of grain about lbs 2, oz. 2.

The man, or maund weight, therefore, varies according to the article weighed. In the Punjab, villagers use a kucha man which is only 13 to 20 seers, and the Lahori man is = to 3 kucha maunds.—*Wilson. Powell.*

MAN, TAM. Sand; earth; (a pronounced short.)

MAN a river of Central India written also Maan. At Surbapere on the Maan, Capt. Keatinge thought he traced the following succession of rocks, (ascending) a light greenstone, metamorphic or volcanic; a soft sandstone, very fine grained and white; compact limestone, bluish white: and then the coral limestone, the latter only containing corals. The compact fine limestone, is found at intervals all over the jungle, and has been very largely used for lime in the Mandoo days; the old kilns are without number. He found fossils, wherever an edge of stone lay over a convenient mud bed to retain them. Echinids and a Brissus were in great plenty, the Bheels call them Paunchia from their five marks, and Pecten 5-costatus. Plagiostoma spinosum and Terebratula octoplicata were numerous, the latter most so and in best preservation, pieces of a large finely marked Echinus cidaris, also a rude impression on a stone of a very large Inoceramus? To the west of Mhow and Indore, there exist extensive beds of the cretaceous series. Dr. Carter in the Journal Bombay Asiatic Society, No. XX, July 1857, page 621, considers that these beds are truly Neocomien. The evidence is that these rocks represent the cretaceous era, but is insufficient to enable one to refer them to any subdivision of that great series. The following fossils were collected at Baug by Capt. Keatinge.

MAN. See Rudra Sanpradaya.

MANA, HIND. *Pyrus malus*.

MANA. HIND. a platform erected in tall crops: on these people sit to frighten off birds, &c.

MANA, a pass in Garhwal, on the Himalaya, in which the temple of Badarinath is placed. The people who occupy the Mana district are Bhots dwelling in the passes and their neighbourhood at heights above 6,000 feet. The pass-men state that ridges which within the memory of man were covered with forest and pasture lands are now covered with snow, showing the extension of the snow zone. The Niti pass on the Duli, a feeder of the Ganges, is the best, and the Juwar on the Gauri pass, a feeder of the Sarda or Gogra, is the worst. The number of well-built houses in the Bhot district are in

Mana on the Saraswati, ... Villages	3	Houses	123
Niti	...	10	219
Juwar on the Douli,	...	13	455
Byansee, Pass on the Kali,...	...	9	184

The Bhot, here, as elsewhere, is an agriculturist, and is assisted by slaves who live under the roofs of their masters. The people in the Mana, Niti, Juwar and Byansee passes are supposed to be emigrants from Tibet who drove out an earlier body of hindoos, and many of the chief families trace their origin to a Tibetan locality. The inhabitants of the Darma pass are said to be a body of Mongols left in Kumaon by Timur and if so they are not true Bhot. The Darma inter their dead for a time, and in the month Kirtik exhume and burn them, but the other pass-men burn their dead on their demise. The Darma practice divination, taking their omens from the warm livers of sheep sacrificed for the purpose. The women of the Darma and Byansee passes dress alike, and these two clans

MANAMADOO.

eat the Yak and would eat the cow, while those of Mana, Niti and Juwar abstain from beef of all kinds and look down, as on an inferior caste on the Darma and Byanse. The Juwar nearest India, have the largest trade, and resort to an annual fair in September at Gartokh, the residence of the Lahsa viceroy. These passes are the roads from India to Nari or Gnari, Tibetan provinces of the Chinese empire. Immediately below the village of Mana, is the hindu shrine dedicated to an incarnation of Vishnu and one of the most sacred hindu temples in hindu mythology. The temple is built on the bank of the Bishen-ganga immediately over the site of a hot spring, the existence of which no doubt led to the original selection of this remote spot. The rawal, or chief priest, is invariably a Namburi brahman from Malabar: no other class of brahman being allowed to touch the idol.—*Cunningham's Ladak*—*Latham's Ethnology*.

MANAAR, an island close to Ceylon, from which the gulf of Manaar has been named, the gulf passage was deepened by a series of engineering operations. Manaar, according to Sir J. E. Tennant, (vol. 2 p. 555,) is the island of Epiodorus, which, according to the Periplus, was the seat of the pearl fishery. Manaar Gulf separating Ceylon, from the peninsula of India, is so named from the island of Manaar near Ceylon, which, with that of Ramisseram near the continent almost connect Ceylon to the peninsula, the two islands receiving the names of Adam's Bridge.

MANABOS. See Mindanao.

MANCE. TAM. Castor.

MANADO. Celebes on its North-coast, is in general high bold land. Its extreme point is called Cape Coffin, and the whole of the islands that stretch from it to Manado bay are sometimes called Banca island.—*Horsburgh*. See India.

MANŒUVRES CORDAGE. FR. Cordage.

MANAGOOT or Mangoosteen. MALAY. *Garcinia mangostana*.

MANAHSIA. SANS. Arsenic, Red sulphuret of Arsenic.

MANAK. HIND. A ruby: also any gem.

MANAKHYALA, a town in Afghanistan. A tope there was opened by General Ventura in April and May 1830.

MANAKYA RAI, See Haravati or Haranti.

MANALI KEERA also Manali-Kiro TAM. *Cissikia pharnacioides*, L. R.

MANALOO OIL. See Oil.

MANAMADOO. White cloth is manufactured all over Southern India, but those

MANBHUM.

of Manamadoo in the district of Trichinopoly are very superior in quality and used by the more respectable of the inhabitants as clothing, under the name of "Manamadoo Sullah". That at Arnee in the district of Chingleput, known as "Arnee Sullah," is of a different quality.

MANAPALA.

Tippa tigo, TEL. | Somavalli, JIVANTI.
Tinospora cordifolia, *Miers*. *Menispermum glabrum*, *Klein*.

MANAR. See Mahabharata.

MANAS. BURN. MALAY. *Ananas sativus*, *Schult*.

MANASA, the goddess of snakes. She is worshipped as a preservative against the bite of these reptiles and is represented sitting on a water lily environed with snakes. If a hindu has been bitten by one, incantations are pronounced to propitiate the favor of Manasa.—*Cole. Myth. Hind.* p. 388.—See Serpent.

MANASAROVARA LAKE or Mansaraur or Manasa-Saras Lake in Tibetan called Tsho-Ma-phan is the same with the Bindu Sarovara of hindu mythology, produced from the heart of Brahma. It is called Anau Anandat, is supposed to be a crater, that four rivers spring from it, and that it is near Su-mern, the abode of gods, the Vindhya-saras of the Purans. Manasarovara in reality is a lake of no exit in Little Tibet, from which the Ganges was long supposed to rise; it is a place of hindu pilgrimage of peculiar sanctity, and was first visited by Moorcroft in 1811, *As. Rs.* 1816, Vol. XII.—See Manasarovara. *Indus*.

MANASSEH. See Kranganou.

MANATAPPAN. A caste of cultivators originally from Coimbatore, first settled in Panlghat and intermixed, and often confounded, with the Nairs.—*Wilson*.

MANAVALA, the head of the Tengala, a Vaishnava sect of the south of India.

MANAY-POONGU. TAM. *Sapiidus emarginatus*.

MANBHOW. Dissenters from hinduism, in Berar and the Dekhan; they wear a black dress, and are of quiet, inoffensive manners. These hindu religious sectaries, are worshippers of Krishna, and about the year 1830 were described by Captain Mackintosh. They are under a vow of celibacy and elect young people into their order. If pregnancy occur the parties are allowed to withdraw.

MANBHUM, a district of Chota Nagpore, has numerous remains of Arian colonization close to its southern and eastern approaches, but none on the plateau itself.—*Dalton*, p. 63.

MANCHE.

MANCHE POONGUM. TAM. *Sapindus rubiginosus*.

MANCHAM. TEL. a bed.

MANCHE a boat or ship. The Calicut *Manche*, is a boat very similar to that of Mangalore with the exception only of a raking stem, for the purpose of taking the beach, as the port of Calicut is open to the coast and there is no river. These boats are propelled by the paddle and sail, and generally carry eight men: they are much employed in watering and completing the sea-stock of ships homeward-bound; also in loading ships with pepper, timber, &c., from Bombay; and in shipping the produce of the forests of Canara and Malabar; all of which is rafted off to vessels called *dow*, *boatile*, *patamar*, &c.

The Panyani *Manche*, is a coasting boat, of about fifty feet long, ten to twelve feet broad, and five to seven feet deep. It is framed with timbers and planks; which are sewed together. The timbers are about four feet asunder, and on them, inside, some few planks are placed as bands and clamps, which are nailed to the frame. These are very rudely put together; and not of much importance, either in form or construction. During the south-west monsoon, or from June to November, they are laid up at Bai-pur river for safety, and are only used in the fine weather season. They carry the productions of the coconut tree, viz. coir, from the husk of the coconut, *Cocos nucifera*, from which rope is made. Copra, the inside albumen of the nut, from which oil is expressed. *Cajon*, the leaf of the *Corypha umbraculifera* tree, which is used for thatching houses, also for books, and various other purposes. *Jageri* a kind of sugar, which is made from the toddy or juice of the palm. Oil and arrack, a strong spirit, distilled from the toddy taken from the palm. These vessels keep along shore and take advantage of the sail in rowing. They have generally from eight to ten men, who are fishermen of the Mopila caste, a race of mahomedans, descendants of the first Arabian settlers on the shores of the peninsula; and who, marrying the daughters of the country, obtained the name of *Mapillai*, or "sons-in-law," corrupted by Europeans into the above term.

The *Boatila manche*, of the island of Ceylon, navigates the Gulf of Manaar, and the coasts of the southern part of the Peninsula of India. This boat, is about fifty to sixty feet in length, sixteen to eighteen feet in breadth, and eight to ten feet in depth, has more of the European form than any of the Indian-built vessels that are met with. The after part shows the construction to be of Portu-

MANCHI-TUNGA.

guese origin as it is very similar to that of many of the boats still in use by the people of that country; which are said to be of the same shape as the vessels in which Vasco de Gama sailed to India. They have a deck fore and aft; and are built with all sorts of jungle wood, in a very rough manner, and fastened with nails and bolts. They are equipped with one mast, which inclines forward, and a square lug-sail; also a small bow-sprit, at about the angle of 45° , with a sort of jib fore-sail, one pair of shrouds, and a back-stay which completes the rigging. These vessels carry on the trade of the island across the Gulf. The exports are, rice, tobacco, &c., and the imports, cloth. This forms a great part of the revenue of the island, in the district of Jaffnapatam.

Mangalore *Manche* of the western Coast of the Peninsula is a flat bottomed boat of burthen, about twenty-five to thirty-five feet long, six to seven feet broad, and four to five deep. It is formed to meet the river, which is very shallow and flat; and to land the cargoes of the *patumars*, which are discharged and loaded at the mouth of the rivers. These boats are sewed together similar to the *masula-boat* and other native vessels: they are forced along by bamboo poles; as the water is not more than from six to ten feet deep, except in the south-west monsoon, when the rapids swell, and the whole of the river is considered impassible: and at this period all the vessels are taken to the shore and laid up.—*Edye*.

MANCHAR. A little north of Larkhana, on the right bank of the Indus, the *Narrah* or *Snake River*, a *Sind Serpentine*, falls into lake *Manchar*, flows through it, and issues from the southern extremity under a fresh name, the *Aral*. The *Narrah* and the *Aral*, form a semi-circle of about sixty miles from point to point, they are probably artificial, as their tortuous course presents the appearance of man's rather than Nature's doings. The country is so level that, when the Indus rises, the water flows up the *Aral*, and vice versa, when the main stream falls.—*Barton's Scinde*, Vol. II. p. 231.

MANCHE. TEL. *Euphorbia tirucalli*. *Linn.*

MANCHIE. TEL. Good, sweet, hence, *Manchi jiluga*, *Sesbania procumbens*, W. and A.—*Eschynomene* pr. R.; *Manchi Kanda* or *Patikanda*, *Arum* (*Amorphophallus*) *campanulatum*, R.; *Manchi mande* or *Tiyya mande*, *Ceropegia*, R.

MANCHI-TUNGA. *Cyperus* sp.

MANDAL.

MANCHO, JAV. *Gracula religiosa* — *Linn.*

MANCHU, a race of High Asia and the N. Eastern parts of Asia. The reigning dynasty in China are Manchu. A Manchu is under obligation to enrol himself under some banner, and failing to do so, loses his privileges. Many neglect to enrol themselves voluntarily in order to avoid the conscription. The Sifo and Solon are the highest tribes of Manchu. The Manchu had no written character until 1644. Mokden is the native capital of the Manchu. They are a Tartar race. The Amoor, second only to the Mississippi, flows into the Pacific Ocean not far north of Japan. Much of the country along the Amoor is susceptible of farming and grazing. Steamers can ascend from the sea to Chetah, a distance of 2,600 miles, which opens up Siberia to the Pacific through the Amoor, presenting a new field for commerce, the ultimate limits of which can hardly be grasped by the most comprehensive mind. Mongolia, Manchuria, Northern China, all the Tartaries, Thibet, and Siberia, with a population of twenty to thirty millions, are approached by this river, and a new route to the Indies opened. Irkoutsk, the capital of Eastern Siberia, can be approached with only about three hundred miles of land carriage. The Chinese have annexed all the neighbouring parts of their territory from the Manchu and Mongol races. Beyond the Paga Gol lies the country of the Ortoos, which extends a hundred leagues from east to west, and sixty-six from north to south. In A. D. 1635, the tribes of this region were Manchu. Cecima Manchuria a mollusk of Olga Bay, Manchuria, is eaten and the Laminaria seaweed is largely stacked in the gulf of Pichili by the Manchu. — *Adams-Prinsep's Tibet, Tartary and Mongolia*, p. 49—57. See India, Japan.

MAND, probably another name for the Med. There are several tribes the Mandar, Mandhor, Mindhra, the Baluch tribe of Mondrani, and the ancient towns of Mandra: Mandropat in Chachgani, to the east of the Guni; Mandrasa, to the north of the Makali hills, and Muudra and other similar names in Cutch.

MANDA or Manga chettu, TEL.? *Randia dumetorum*, *Lam.*?

MANDA, a kind of bread.

MANDAKU or Manda chettu, TEL. a plant the juice of which prevents baldness.

MANDAL, that form of oriental divination which owed its celebrity in Europe to Mr. Lane. In the Mandal, or palm-divination, a black slave is considered the best subject. European travellers have frequently

MANDARAWAR.

marked that nervous sensibility. In Abyssinia the maladies called "bouda" and "tigritya" appear to depend upon some obscure connection between a weak impressionable brain and the strong will of a feared and hated race, the blacksmiths. — *Burton's pilgrimage to Meccah*, vol. I p. 18; III. p. 220.

MANDAL, HIND. Rhododendron arboreum, also Acer cultratum the maple. In Kulu Acer candatum.

MANDAL, or Marwa, Eleusine coracana.

MANDAL. See Mandwah.

MANDAL, straw rope, made of Eleusine coracana.

MANDAL. — ? Agallochum.

MANDALA. See Inscriptions. Vedas.

MANDALAM, SANS. a region, as Tondamandalam, Pandu Mandalam, Chola mandalam, Mandlaisir and Oka Mandal. See Mandel.

MANDAJADI. *Adenanthera pavonina*.

MANDALICA. See Khengar.

MANDALIQUE ISLAND, in lat. 6° 22' S., long 110° 53' E., is a small round island off the N. Coast of Java — *Horsburgh*.

MANDA MOTUKU, TEL. *Dalbergia Oojeimensis*.

MANDAPA. The portico of a hindu temple. See Mantapam.

MANDAR, the Mount Mandar, celebrated in the Puranic legends for the churning of the ocean, lies southward of Bhagalporo. On the downfall of buddhism, Mandar fell into the hands of the shivites and became a seat of their god so as to rival Benares and form, as the Kasikhand states, a second Kailasa. The legend of the churning of the ocean is an interpolation in the Mahabharata and evidently refers to the contest between the brahmins (soora) and the buddhists (asoora) the great serpent Vasookee, alluding to the sect of the Naga. *Tr. of Hind.* See Mandara.

MANDAR, HIND. *Acer creticum*, and *A. cultratum*.

MANDAR, PORT. *Arenga saccharifera*, *Labill.*

MANDARA, the mountain which was used by the hindu god Vishnu as a churning stick at the churning of the Chira-Samudra or Sea of Milk. It is remarkable for having on it a colossal figure, carved in granite. See Kurma. Vishnu. Mandar.

MANDARA, SANS. *Calotropis gigantea*. *Brown*, also *Erythrina indica*, *Lam.* Also amongst hindoos, a celestial tree.

MANDARA. A Penang wood, of a pale red colour, specific gravity 0.939. A small tree; used for ornamental furniture. — *Cul. With.*

MANDARARI. See Kelat, p. 493.

MANDARAWAR. See Kafir.

MANDESTI.

MANDAREH, TAM. *Bauhinia acuminata*.—*Linn.*

MANDARIN A magistrate, or a person having authority, from a Portuguese word mandar, to command. Chinese mandarins, use bamboo caps in summer as the official head dress.—*Walhen's Voyage*, p. 180.

MANDATA, HIND. *Prunus armeniaca*.

MANDAVALLI, CAN. *Convolvulus rep-tans*.

MANDAVI, in Guzerat, its chief is of the Bagela race. See Kattyawar. Kutch.

MANDAWALL. See Kelat, p. 492.

MANDEKI, MALAY. *Cucurbita citrullus*.—*Linn.*

MANDE, or Manch mandu. *Ceropegia*, L.

MANDEL. DUT. DAN. GER. SWED. Almonds: *Amygdalus communis*.

MANDEL, a township, in its simplest form, is under a Headman, called in the Dekhan and in the west and centre of Hindustan Patel; Mandel in Bengal: Makaddum in many places. He is assisted by different officers of whom the accountant and watchmen are the most important. The Accountant, called Patwari in Hindustan, Kul-kurni and Cur-num in the Dekhan and south of India, and Tallali in Guzerat: 2. The Watchman, called Pasban, Gorayet, Peik, Domaha, &c., in Hindustan, Mahar in the Dekhan, Tillari in the south of India, and Paggin in Guzerat: 3. Money Changer or Silver Smith. 4. Priest. 5. Astwhju. 6. Smith. 7. Carpenter. 8. Barber. 9. Potter. 10. Worker in Leather. 11. Tailor. 12. Washerman. 13. Musician. 14. Minstrel. 15. Dancing girl. The number is fixed by common opinion and by the native name "bara-balotta" at 12, but varies in different villages, and the officers included are not always the same, though up to No. 10 are seldom wanting. From 11 to 14, are not so general and the dancing girl seems only to be in the South of India. Each of these village officers has a fee, sometimes in money but more frequently a portion of produce, as a handful or two out of each measure of grain. *Wilson*. See Mandal, Mandalam.

MANDELGURH is the largest district of Mewar, and in its three hundred and sixty towns and villages, many specimens of ancient usage may be found. The Solanki held largely here in ancient days and the descendant of the princes of Puttun still retains his "bhoom" and title of rao.—*Tod's Rajasthan*, Vol. I, p. 169.

MANDELN. GER. *Amygdalus communis*. The Almond.—*Linn.*

MAN-DESA. The Man district. See India, Maan.

MANDESTI. TEL. *Rubia cordifolia* Madder.—*Linn.*

MA'NDHA'TA.

MANDEVILLE, Sir John, author of a book of alleged travels in India and China. He set out from St. Albans in 1332, and returned and died in Liege in 1386. His descriptions of Ceylon are borrowed from Marco Polo and Odoric of Portendu. He seems to have adopted, as regards Sumatra, the accounts of Odoric when he says, "Beside the ysle of Lomery is another yclept Sumobor; and fast beside, a great yole yclept Java."—*Marsden's History of Sumatra*, p. 7, 8.

MANDGAI. DEKH. *Bambusa arundinacea*.—*Roxb. C. P.*

MA'NDHA'TA, an island in the Nerbata belonging to the Nimar district, remarkable as containing numerous temples, ancient and modern, including the great shrine of Omkar, a form of Siva. It is cleft in two by a deep ravine running nearly north and south the eastern end containing about one-third of the whole area. The southern bank of the Nerbada opposite Mandhata (called Godarpura) is as precipitous as Mandhata, and between them the river forms an exceedingly deep and silent pool, full of alligators and large fish, many of which are so tame as to take grain off the lower steps of the sacred ghats. The worship of Siva was established here at an early age. On Mandhata the shrine of Omkar, and on the southern bank that of Amareswar (lord of the immortals), are two of the twelve great Lingam which existed in India when Mahmud of Ghazni demolished the temple of Somnath in A. D. 1024. The name Omkar is from the syllable Om, which, says Professor Wilson, is a combination of letters invested by Hindu mysticism with peculiar sanctity, employed in the beginning of all prayers. It comprehends all the gods, the Vedas, the three spheres of the world, &c. The brahmins who now officiate at the shrine wish to exclude Omkar from the twelve Lingam usually called "A' di" or "first," as something above and before them all. The Narmada Khand supports them in this assertion, but as it contains a prophecy of the time when India shall be ruled by Mlechha (non-Hindus) and other modern allusions, its antiquity is certainly a good deal open to doubt. The evidence of the Kasi Khand and other Sivite writings is against them, and the pilgrims, who have vowed to visit the Bara jyoti Lingam, pay their adorations both to Omkar and Amareswar. The raja of Mandhata, who is hereditary custodian of all the modern temples, is a Bhilala, claiming descent from a Chauhan Rajput named Bharat Singh, who is stated in the family genealogy to have taken Mandhata from a Bhil chief in the year A. D. 1165. *Atk.*

MANDLA.

MANDHATI, Mandhatri, Mandhat. See Hindu.

MANDLA. An inferior grain produced in Bastar.

MANDI GANDRALU. TEL. A sort of grain, ? Naga malle and Tige malle, two sp. of jasmine.

MANDRA CHETTU. TEL. A tree."

MANDIVE PLANT. ENG. Janipha muhiot.—*Kth.*

MANDLA. A district lying between L. 23° 2' and 22° N. and L. 80° and 81° 40' E. It is bounded on the east by the state of Rewa and a portion of the Bilaspur district, on the north by the Solagpur and Chendya taluka of Rewa and a small portion of the Sleemanabad tahsil of the Jabalpur district, on the west by the districts of Jabalpur and Seoni, and on the south by the districts of Seoni, Balaghat, Raipur, and Bilaspur. The population for the whole district in 1866 was 1,87,699 and of these 1,27,958 were agriculturists.

			187,699

The original inhabitants of this district are undoubtedly the Gond and Baiga, who at the present time form the larger share of the population. Next to these are brahman families some of whom affect to trace back their arrival in Mandla to the time of Jadhava raya in Samvat 415 (A. D. 358) though it is much more probable that they settled here in the reigns of Hirde Sah and Narendra Sah, from Samvat 1663 to 1788 (A. D. 1606 to 1731). The former of these two kings introduced a number of foreigners into the country, especially a large colony of Lodhia, who settled in the valleys of the Banjar, Motiari, and Nerbada, gave the name of Hirdenagar to the taluka thus brought into cultivation, and did much by digging tanks and otherwise to colonise the best parts of the district. With these exceptions, and that of the Mahto Teli immigration into Rangarh at a much later period, there is no other trace of the population of the district having been recruited from foreign resources. These Mahto are without exception the best cultivator class in the Rangarh tahsil. These people are hindus, originally of the teli caste, and formerly resident at Mathir. In Mandla the Gond race is divided

MANDLA.

into two classes, which again are subdivided into forty-two different castes or got. The two classes are the Raj Gond and the Rawan Bansi. The former is the higher and outdo the highest caste hindus, in the matter of purifying themselves, and ape them in all their religious ceremonies. They wear the janco or brahminical thread and consider themselves deeply insulted if compared in status with a Gond. Mr. Hislop, says that they carry their passion for purification so far that they have the faggots with which their food is cooked sprinkled with water before use. The Gond tribes are

Marobi	Chichain	Kornpu	A'mega
Markam	Murkola	Sima	Mohram
Warkura	Sarota	A'ndan	Kuram
Sri A 'M.	Pholi	Tomeria	Nakma
Tekam	Blagdyia	Darzan	Dhalya
Dhorda	Wuika	Khudam	Barhaya
Karyain	Pandu	Korchu	Bhena
Warwiti	Kumbara	Kalku	Bhiman
Partili	Danketi	Temirachi	Ghusin.
Sarjan	A'rmon		

To these may be added the Agharia or Muki Pardhan Pathari or Gugya, Dhalya, who differ in some slight peculiarities from the Gond, but undoubtedly belong to the same race. The Pardhan act as bards to the Gond and attend at births and deaths and marriages. The Agharia is a worker in iron, he frequents the Baiga villages, and acts as blacksmith to the whole community, no light task where the iron-ore has to be dug from the hill, carried to the village forge, smelted, and then worked up to meet the wants of the people. These people may be set down as the laziest and most drunken of all the Gond race.

The Gond of the Nagpur country is a little under the average height of "Europeans and in complexion darker than the generality of hindus, bodies well proportioned, but features rather ugly, a roundish head, distended nostrils wide mouth, thickish lips, straight black hair and scanty beard and mustaches. Both hair and feature are decidedly Mongolian," and this description agrees very well with the Mandla Gond above the ghats. Their women are as a rule better looking than the men. The wives of the Gond are looked upon as so much property, for they are expected to do not only all the household work, but the bulk of the agricultural labour also. It is a common expression among them, when speaking of a well-to-do farmer, to say that he is a man of some substance, having four or five wives; occasionally they have seven, but this is exceptional and the poor content themselves with one. In dress the women are usually decent, though they wear only the dhoti and shoulder-cloth of coarse country made stuffs

MANDLA.

white, with a coloured thread border. For ornaments they wear strings of red and white beads, ear rings of brass wire in coil, and polished zinc bosses sometimes nose-rings of the same and anklets and armlets of copper and zinc mixed or of pewter and zinc. They are tattooed at an early age, some much more than others and allow themselves to be put to considerable amount of pain in the performance. The Pardhan and Dolya are the people who practise the art of tattooing and some have quite a local reputation for their skill in the art and for the successful patterns with which they adorn the bodies of their victims. They usually work with needles, and rub in indigo and gunpowder or saltpetre. Though wild, uncivilised and ignorant, the Gond are, among themselves honest, faithful, and trustworthy, courageous and in some points trustful: as regards faults they have committed, as a rule, they plead guilty when brought before the courts. As a race they are now well behaved and very amenable to authority. The number of their deities seems every where to differ. Mr. Hislop says that he never could get any one man to name more than seven. The best known are Duladeo, Narain Deo, Suraj Deo, Mata Devi, Bara Deo, Khair Mata, Thakur Deo, and Ghausyan Deo. Besides these, the Gond peoples the forests in which he lives with spirits of all kind, most of them vested with the power of inflicting evil and quite inclined to use their power. To propitiate them he sets up "pat," in spots selected either by himself or by his ancestors, and there performs certain rites, generally consisting of small offerings on stated days. These pat are sometimes merely a bamboo with a piece of rag tied to the end, a heap of stones, or perhaps only a few pieces of rag tied to the branches of a tree. The Gond have seven different kinds of marriages, some much more binding than others.

Widows are expected to remarry and the Gond customs provide for their re-marriage in two ways, the "Churia Pahanna Shadi," and the "Kari Shadi." The first consists simply in the woman proceeding to the house of the man she has agreed to live with after her husband's death. The other is where the younger brother marries his elder brother's widow, which he is expected to do by the custom of the tribe, unless the widow should insist upon making some other arrangement for herself. The ceremony in both of these cases consists simply of a presentation of bangles by the husband to the wife, and of a feast to the village elders. Cremation is considered the more honorable mode of disposing of the dead but being ex-

MANDLA.

pensive, is very seldom resorted to except in the cases of the elders of the tribe. Formerly the Gonds used to bury their dead in the houses in which they died, just deep enough to prevent their being dug up again by the dogs, now they have generally some place set apart as a burial ground near the villages. Their funeral ceremonies are very few, the grave is dug so that the head shall lie to the south and the feet to the north, the idea being that the deceased has gone to the home of the deities which is supposed to be somewhere in the north, but the Gond do not appear to have any real theory as regards an after life or the immortality of the soul. The Baiga are the acknowledged superiors of the Gond races, being their priests and their authorities in all points of religious observance. In physical appearances the Baiga differ so much as almost to defy description. One sect the Mundiya is known by the head being shaven all but one lock. The Binjiwar on the other hand wear their hair long, never cutting it, and tie it up in a knot behind, so do the Bhirandiya. In stature some are taller, than the Gond, but as a rule they are all very much below, the average height of Europeans. The Baiga to the eastwards on the Maikal range are finer men than those near Mandala. In habits too, they are superior being a fine manly race, and better looking than their brethren near Mandla. They have not the flat head, and nose and receding forehead so common among the Gond, the head is longer, the features more aquiline, and the hands are peculiarly small. Some among them have, however, all the types of low civilization, flat heads, thick lips, and distended nostrils, but on the whole the appearance of the Baiga of the Eastern Ghats is striking, as compared with that of other wild tribes. The women are all tattooed and like the Gond they wear bunches of wool tied up in their own hair. They are no cleaner, than their neighbours, neither sex affecting the use of cold water any more than can be helped. In their religious ceremonies they much resemble the Gond, reverencing the same gods, but adding to them as the chief object of worship the mother earth "Mai Dharitri." Thakur Deo is supposed to have special charge of the village, and is honoured accordingly. But the Baiga have a great belief in the spirits, which are supposed to haunt the forests and in the localities which are now especially the homes of these spirits: "Pat," are set up, each under the charge of an appointed Baiga. There appears to be no especial rule regarding the institution of a pat. Sometimes it is the place, where a man

MANDRAGEN.

has been killed by a tiger or a snake, sometimes no reason whatever is given for the selection. The dahya cultivation covers a large area in this district. With no other instrument of agriculture but their axe, and a small sickle ("hausya,") it is astonishing to see the extent of clearing that one village of Baiga makes on the sides of the hill on which their village is located.—*Central Prov.*

MANDLASIR, in lat. 22° 11' N., long. 75° 46' E., in Malwa on the right bank of the Narbada. The level of the Narbada is about 700 ft.—*Wils.*

MANDLOI. The title of an officer under native rule.

MANDOH, the ghost of a mahomedan, is, in hindu demonology, deemed the most malignant of all demous.

MANDONG. A rush much used by the natives in the manufacture of rice and sugar bags, mats, and for tying up articles, the fibre being strong. It grows spontaneously in the rice fields of Province Wellesley after the crop has been gathered and over-spreads them like a second crop. It may prove suitable on experiment for the manufacture of paper.—*Royle.*

MANDOO, some time the capital of the independent mahomedan kingdom of Malwa. It is on a spur of the Vindhya mountains, overlooking the valley of the Nerbudda and the plains of Nimar, having a site at an elevation of more than 2,000 feet above the sea, and a climate not unlike that of the Mohtoor sanatorium with similar scenery. The city of Mandoo was founded by Hoshung shah, the founder of Hoshungabad; the second king, Mohamed Khiljee, erected a mausoleum of white marble over the remains of Hoshung shah, still in good preservation. On the Mandoo hill, is a terrace on which the hindu queen would recline to gaze on the sacred Nerbudda winding through Nimar; close to this terrace was erected a palace, near a well-known spring, which to this day is called the Queen's fountain. In general mahomedan ruins are situated on the plain, without any imposing back-ground to the picture, but at Mandoo the ruins are situated in the midst of beautiful mountain scenery, so that the combination of works of art with the beauties of nature is most charming. Mandoo is built on coralline limestone, but that used for building is derived from near Baug or Bagh. See Kalmuck, Malwa.

MANDOR. See Rahtor.

MANDORLI, *Ir.* *Amygdalus communis.*

MANDRA, *Hind.* *Marlea begoniaefolia*, also in Kaghan, *Hedera helix*, the ivy.

MANDRAGEN, *Ger.* Mandrake.

Lakmuni, " "	"	Kaat-juti,	<i>Tam.</i>

The Mandragora, or mandrake, the fetid root of which was so celebrated in the magic rites and toxicology of the ancients, is known in the bazaars of Central Asia and the north of India. It has various names, arising from its fancied resemblance to the human form. It was formerly an article of the *Materia Medica*, but is now exploded, though the leaves are still sometimes employed in preparing anodyne fomentations. The Arabians place the root, which they call Usul-ul-loofah, amongst their most powerful cathartics, and also suppose it to be of use as an antispasmodic. What of it is found in India is probably brought from Persia or Arabia. It is found in many parts of the South of Europe, is of poisonous qualities and its smell is very fetid. Loofah is the plant. Tuhfah-us-shaitan is the fruit. Its properties are identical in nature with those of *A. belladonna* but weaker in consequence of drying and decomposition of the atropia. The mandrakes of Gen. xxx, 14, are generally supposed to be the root of *Mandragora officinalis*: Calmet regards Dudaim and plantains as citrons: but, violets, lilies, jasmynes, have all been named.—*O'Shaughnessy*, p. 466. *Hoy's Veget. Kingdom*, 552. *Paulkner. Ains. Mat. Med.* p. 26. *Calmet.*

MANDRI, *Hind.* *Ribes leptostachyum.*

MANDRONG, a rush of province Wellesley, made into rice and sugar bags, mats, &c. It grows spontaneously in the rice fields after the crop has been gathered over-spreading them like a second crop. See Mandong.

MANDSHU; MANDSHURIAN. See India. Manchur.

MANDU, *Hind.* *Ulmus crata.*

MANDUKA BRAHMI, *Mandukaparnamu*, or *Saraswati aki*, *Tel.* *Clerodendron viscosum*, *Vent.* Heyne 133, gives this name to *Leonurus nepetaefolia*. Br. applies it to *Calosanthus rubia*, *Hydrocotyle*.

MANDULA MARI TIGE or Kadepa tige, *Tel.* *Vitis (Cissus) carnosus*, *Wall.* This name is also applied to other species of vine.

MANDVIE. See Komarpul.

MANDWAH, *Pers.* *Eleusine coracana* *Gert. Roxb.*, the ragi of the Tamil people.

MANE, *Tam.* Beads

MANG.

MANEKAM, MALAY. Baby.

MANEL, a pink water-lily of delicious perfume, commonly offered before the figures of Buddha. Its flower closes at sunset.

MANEE AUKA, BURM. A tree of Maulmein. Wood used for ordinary house building purposes. The bark is used medicinally. —*Cal. Cat. Ex.* 1862.

MANEEOGA, BURM. According to Capt. Dauce, stated by Burmese to be much used for rice pounders. Its maximum girth 4 cubits and maximum length 30 feet. Abundant all over the Tenasserim and Martaban provinces. When seasoned it floats in water. It is not a good wood, as, when stored, it soon dies and rots; the roots are used for medicine; the fruit is eaten by Burmese.

MANEIOGA, *Carallia integerrima* De Candolle, *Carallia lucida*, *Rozb.* According to Major Benson, one of the Cinchonaceae, its peculiarity of grain, which resembles oak, would make it useful for decorative purposes; very brittle. —*Major Benson.*

MANELAVADU, TEL. An itinerant dealer in coral and gems; commonly termed a Manilla-man, but probably from Maui, S. a jewel.

MANER, HIND. of Chamba. Acer cultratum, maple. See Maudal.

MANERU, TEL. *Celastrus paniculata*. —*Willd.*

MANERUNG, in the Himalaya in L. 31° 56' N., L. 78° 24' E. Its crest, is 18,612 feet, and the source of the Darbung, there, 15,000 feet. A very difficult pass. See Kunnawer.

MANERU or Mala erikata TEL. *Celastrus paniculata*. —*Willd.*

MANES, of hindus, are worshipped and have sacrifices offered to them after demise on the 3rd day, the twelfth day, every month of the first year and on every anniversary. See Burial Customs.

MANETHO visited Egypt soon after the Macedonian conquest.

MANETTIA. See Cinchona.

MANG or Mhang. A low caste or tribe scattered through parts of the Bombay Presidency, in Guzerat, Candish, the Concan and Kolapore, employed as village watchman and in humble offices. The Mang reside outside villages. They are met with in most of the hamlets throughout the Hyderabad country and in Berar, and serve as scavenger, guide, watchman and executioner. Their signature mark is a knife. They are part of the Baloth, and like the Dher or Mahar, are predial slaves of the village. There are 35,453 in Berar.

MANG or MAN, See India.

MANGANESE.

MANGA or Mranga. TEL. *Randia dumetorum*, *Lam.* *Posoqueria dum.* R. i. 713. *Gardenia dum.* Cor. *Vangueria spinosa.*

MANGAI or MANGO, the Malayala name of the mango tree. It grows to a large size, many trees being found three feet in diameter, and thirty feet high. The wood is of a whitish colour, and is not durable or of much value. The natives make canoes of it. —*Edge Mal. and Can.*

MANGALA. See Vara or Vasara.

MANGALA or Cuja. See Graha.

MANGALA SUTRA. SANS. Tali H. a thread with a gold coin or other valuable, which every hindu married woman in the south of India wears during her husband's life time round her neck. It is tied on by the bridegroom at the time of marriage. In the north of India, it is a string or piece of silk tied round the wrist during the marriage ceremony. —*Wilson.* See Hindu.

MANGALYANA. See Buddha.

MANGALYAN also Margali. TAM. A barber by caste and occupation.

MANGALAVADU also Mangali. TEL. A barber.

MANGALORE, on the coast of Canara, in lat 12° 52' N. and long 74° 49' E., is built near the mouth of a river, navigable by small vessels, with about 10 or 11 feet on the bar. It is the Manjannr of mahomedan writers, the Manganor of the Catalan Map, and is probably Mangarath, one of the pepper ports of Cosmas, but the Mandagira of Ptolemy and the Periplus must have been much farther north. *Horsburgh. Yule Cathay* II. p. 451. See India, Kummaler, Masiris, Parwari.

MANGALORE MANCHE, Calicut Manche, Panyani Manche, are coast boats, of construction suited to the places from which they are named. See Manche.

MANGANESE.

Braunstein,	Der.	Braunstein Glasseisegru
Oxide noir de manganese	Fr.	Mangan hyperoxyd, "
Manganese,	"	Manganesin, "
Mangalese,	"	Manganesin Nigra, LAT.
Savon du Verre,	"	Manganesium, "
	"	Manganesia, SP.

In the bazaars of the Punjab, manganese in the forms of a silicated sesquioxide and a peroxide is obtainable as a black powder, or in lumps of the pyrolusite. The metal is very brittle, of a dusky white colour, and without either malleability or ductility. But the substance known in commerce under that name, is the peroxide, or black oxide of the metal. It occurs native in the Mendip hills, Somerset, in the counties of Devon and Aberdeen and in many parts of India. It is found in a

MANGCHAR.

variety of forms; most commonly it is of an earthy appearance, and mixed with other ingredients; but sometimes, in crystals of a black colour and metallic lustre. At the Madras Exhibitions of 1855 and 1857, some very large samples of the silicated sesquioxide were exhibited from Vizianagrum, which contributed two tons in blocks, weighing from 2 cwt. to 3 cwt. each, with from 53 to 64 per cent. of metallic manganese. The substance is well suited for glazing pottery, along with galena, and felspar. A great variety of pleasing colors can be imparted to the glaze by varying the proportions of the manganese: thus, in small quantities it gives a yellow color, in large, brown, then a blood-red, purple or black, as the proportion of manganese is increased. It has also the property of hardening the glaze, so as to resist vinegar and weak acids: concentrated mineral acids however will corrode it. Manganese is used in small quantities by the natives of India in giving purple, brown, and black colours to glass for bangles. Good ore occurs in Kurnool and Toomkoor in Mysore. Peroxide of manganese occurs in the form of a compact black stone, with a smutty brown or black powder on the surface, is of value and is largely employed for manufacturing purposes. It occurs in Soondoor, and Roodrar in the Coilecoontlah talook, Cuddapah, Bellary and Bimlipatam. A specimen from the latter locality contained about 30 per cent. of peroxide. Brown wad and brown fibrous manganese occur at the Red Hills, Bangalore and Cuddapah, ores of manganese occur at the Neilgherries. Many of the iron ores and iron sands contain manganese. Captain Tremenhore reported on the manganese of Mergui, and Mr. Mason has seen specimens of manganese mixed with iron from one of the islands south of Mergui. Peroxide of manganese is largely consumed in the manufacture of bleaching compounds; it is also used by potters and glass makers, and in the laboratory it is considered the cheapest material from which to procure oxygen.—*M. E. J. R. Waterston* quoted by *Faulkner, Powell Handbook, Econ. Prod. Punjab*, p. 100. *Mason's Tenasserim*.

MANGAR, HIND. *Rosa webbiana*.

MANGARAI. See India.

MANGA-VATTAL, TAM. sliced mangoes.

MANGCHAR has a few dispersed hamlets.

It is well irrigated with canals and the whole plain is intersected with bunds or dams to preserve the rain. The tomans are scattered over the plain. Many brood mares are kept. It is separated from Mustang by a lengthened valley termed Khad, in which the Shrivani tribe of Brahui dwell. The Brahui

MANGIFERA CÆSIA.

tribes on the east, border with the Mandawari, Kuchik and Puzh Rind tribes and the Ghazgi Brahui, adjacent to Kach Gandava. See Kelat.

MANGIFERA, a genus of plants belonging to the natural order Anacardiaceæ. Three or four species of this genus are enumerated—as *M. fetida* of Loureiro, a native of Cochinchina, the Moluccas, Sumatra, and Penang. *M. laxiflora*, Desv. indigenous in Mauritius; and *M. sylvatica* of Roxburgh, a native of the hilly districts bordering on Silhet, called Lukshmee-Am, grows to a great size, and bears a fruit which ripens in February and March, and is eaten by the natives, though not so palatable as even a bad mango. It is also dried and kept by them for medicinal purposes. *M. oppositifolia* of Roxburgh, a native of Rangoon, was proposed by Messrs. Wight and Arnott to be formed into a distinct genus. *M. glauca*, Blainv, a tree of the Moluccas, *M. quadrifida*, Jack, *M. cæsia*, Jack, trees of Sumatra and *M. gandaria* of the Moluccas.—*Voigt. Rozb.* 1641.

MANGIFERA ATTENUATA.

Taw-sa-tha-yot BURM.

Found in the Pegu and Toung-hoo forests, but scarce; wood dark brown.—*McClelland*.

MANGIFERA CÆSIA. JACK.

Binjai, MALAY.

A tree of Sumatra.

MANGIFERA INDICA.

MANGIFERA DOMESTICA, GÆRTN.
RHEEDE. Syn. of *Mangifera Indica*, Linn.

MANGIFERA FETIDA, Lour.

LA MOOT, BURM. | Bachang, MALAY.
Horse mango, ENG. |

This large mango is cultivated at Mergui, and is quite a favourite with the natives. It has an odour resembling the dorian, and like that has been introduced from the Straits. Wood not known.—*Dr. Mason*.

A tree, generally diffused over all the warmer parts of Asia; but it extends as far north as 30° in the Punjab, in N. India up to 3,500 feet and up to Nahu at an altitude of 4,000. It has been successfully introduced into the West Indies. It grows to a great size, with an erect trunk, and dark coloured cracked bark. Its flowering time is January, February and March: the fruit ripens in May, June and July, and is one of the most grateful fruits of the tropical parts of Asia. The Archipelagic names of the cultivated mango are all, according to Crawford, derived from the Sanscrit, Maha-pahala, or great fruit. Through the agency of Europeans, however, the corrupted form of the Sunda name for the wild mango has become prevalent throughout the east from Madagascar to the Philippines, and has extended to America. The mangoes of Mazagan were once celebrated. The best mangoes come from Goa, Bombay, Multan, Hushyarpur and Karmal. The best of all are the 'paiwandi,' or grafted mangoes, at once known by the utter absence of all stringiness of texture, and by their delicate flavor. Natives usually prefer mangoes when they are so ripe that they have lost their firmness, and are quite flabby and soft. The wood is of a dull grey colour, porous, yet pretty durable if kept dry, but soon decays, if exposed to wet, of the effect of which it is very sensitive. In very large old trees it acquires a light chocolate color towards the centre of the trunk and larger branches. This is hard, closer grained and

MANGIUM CELSUM.

much more durable. It is generally used for constructing massoolah boats and for packing cases, the cabinet-makers at Madras prefer it to other wood for veneering on: it is also generally used by coach builders, cabinet makers, and others, where common light wood is required, being the cheapest wood obtainable for packing cases, boarding and rough work, and for backs and linings of furniture. The wood holds a nail faster than any other wood. It is very serviceable wood for planks, when not exposed to wet, and is much used for house purposes, but much less for carts. It seems to bear the action of salt water better than that of fresh; is hence used for canoes. It could be readily creosoted. It is used in Mysore for the solid wheels of country carts, and rough furniture. The kernels are large and seem to contain some nourishment, during times of scarcity and famine, they are boiled in the steam of water and used as an article of diet. Propagating by layers, and grafting by approach, are the only modes of certainly continuing fine sorts, as well as of improving them. These have the advantage also of bearing when small in size, that is, only a few feet in height, and therefore well suited to culture in the hot-houses of Europe.—*Voigt*; *Edge*, *Forests of Malabar and Camara*, *Captains Macdonald, Beldome and Puckle*, *Cat. MANGIUM CELSUM, is the loftiest of the mangrove family. Its wood forms good palisades for swamps. Its crooked branches are employed by the Chinese as anchors and

MANGO.

radders for their junka, and tribes in the Archipelago, live on the pith of the seeds, boiled with fish or cocoanut milk. Its leaves are eaten as a vegetable.

MANGKASAR, a name of the Macassar race. See Bugi, India. Macassar. Minalhassa.

MANGKUDU MALAY. *Morinda umbellata*, used extensively as a red dye throughout the Archipelago.

MANGLES, Ross Donnelly was born in 1801, and obtained his appointment as a writer in the Civil Service in Bengal, in April 1819 and after various offices in October 1837, he became officiating Secretary to the Government of India in the Judicial and Revenue Departments, and officiating Private Secretary to the Deputy Governor of Bengal in the same departments, in 1838, a temporary member of the Sudder Board of Revenue. At the general election of 1841 he was returned for the borough of Guildford. He was chosen again, in July, 1847; in 1852 and 1857. Mr. Mangles' career in India was marked by ability and vigour. He contributed some able articles to the *Edinburgh Review* on India and Indian affairs, and is the author of a "Vindication of the Honourable East India Company and their Government of Bengal from the Attacks of Messrs. Richards and Crawford," published in 1830. For many years a Director of the East India Company of which he was Chairman in 1857. In Parliament Mr. Mangles was a strong Liberal and supported the Ballot, the admission of Jews to Parliament, and the abolition of Church rates.

MANGLI. See India.

MANGLIETTA, a genus of plants belonging to the natural order Magnoliaceae, *M. glauca*, has a white solid wood, which is largely employed in Java, and is supposed to prevent the decay of corpses put into coffins made of it.—*Eng. Cyc. Hog. Veg. King*.

MANG-MO, a name of Bamo, a frontier town in the Shan territory, between Yunnan and Burmah. It has the Pu-long tribes on the Ka-khyen around it. See India.

The mango tree, now so extensively cultivated, is said to have been brought into India by Ravana, from Ceylon. There are many varieties of this fruit in India. Some of the most esteemed sorts are the Alphonso,

MANGO.

Raspberry, Doriah, Maghrabah and the Mazagong. The practice of engrafting the mango, was first introduced at Madras, by Dr. James Anderson, who improved it in so great a degree as to have gained it, and perhaps, justly, the title of the finest of all Indian fruits. Rumphius is of opinion that mangoes heat the blood and produce exanthematic affections. When ripe, it is served up at dessert, and when green, is used for making preserves, pickles, tarts, &c. The mango may be procured twice in the year in Bombay. Propagation may easily be effected by seed and cuttings, &c., but the process is slow, as a tree thus raised will not bear fruit before the 5th or 6th year, whereas those that are grafted produce in the 2nd or 3rd, although it is injurious to the tree to let it bear so early, and the blossoms should be removed. Young grafts will sometimes, indeed very often, blossom the first season they are removed, but if allowed to bear fruit, it checks them for a length of time after. A mango graft may be applied at any time of the year, but the stock must be kept continually moist by watering. When the graft and stock have become united, the former must be partially divided by a notch with a sharp knife: this may be done after six weeks have elapsed from the time of its first being united: a second cutting may be effected a fortnight later, and the complete removal from the parent tree at the expiration of nine or ten weeks. After this, remove the graft into the shade for a fortnight longer, when it may be put into the spot where it is to remain. A graft tree never attains the size of a seedling, neither will it continue to live or bear so long, and it is doubted if the seed of a graft mango would produce the same fruit, whereas a seedling often does so. The time that a seedling takes to produce fruit is the great objection to this mode of rearing trees: nevertheless a young tree of three years old might have one of its branches brought into blossom by ringing; this would enable the cultivator to judge if the tree was worth preserving or not. The Maghrabah variety is of a greenish tinge inside when ripe, and by far the largest of the whole, being three times the size of an Alphonso and it ripens the last. When the graft is planted out, it requires only a moderate proportion of care, clearing the ground of all weeds, and removing any buds that shew themselves. Within the space from the ground to where the first branches are to rise from, all superfluous and weak shoots should be removed, more particularly those from the centre of the tree, as also all

MANGO.

branches that trail on the ground, unless required for grafting from. The tree is better for being pruned, and whenever the interior of a tree may contain superfluous branches or when there is not sufficient room for the growth of the young and fruit bearing shoots, a clear space must be provided,—and this can only be done by pruning. The best time for this operation is soon after the tree has done bearing fruit. No old and decayed wood should be allowed to remain, and great care must be taken to remove, on the first appearance, the “borers,” should they indicate their presence by their appearance on the bark. When trees are old and have their bark injured, it must be all cleared away, and the parts covered with a composition. One mode of propagating by slips or cuttings is thus described; take slips from the healthy branch of a mango tree, at least two feet long, taking care to cut it one inch above the joint at the top and the same below the joint at the bottom. The cuttings will not all be equal, as in some branches the joints are short and in others long. The thickness of the slip is to be from three quarters to three inches in diameter. Half the length of the slip is to be slightly punctured with an awl, and then inserted into the ground to that depth (half of the slip) perfectly perpendicular, and then make a knob at the top of the slip with plain cowdung. The cuttings must be well watered in such a manner as to keep up an uninterrupted moisture in the ground; and moreover the cuttings are to be well shaded, and the coverings only to be removed by degrees as the plants attain leaves and strength, and not to be transplanted on any account until the next monsoon. The slips begin to bud within a month generally, but sometimes take a much longer period. In all cases the punctures are indispensably necessary, to admit of root fibres being thrown out from them.

The tree and its fruit may both be improved, if, during the cold season, the ground is dug all round the roots, and by the addition of a suitable quantity of good old manure. The seed will only grow when fresh, and seldom after six weeks. Tenasserim mangoes are notoriously inferior. There are two different species, *Mangifera indica*, and *M. sylvatica*, both of which the natives say grow wild, and several varieties are cultivated in the Provinces. The finest is a variety from Siam, which produces a large fruit with a very thin stone. The mango fruit is very plentiful throughout Pegu, but more especially in the Tharawaddy and Toungoo districts. Mangoes are often dried before they are ripe, after having been cut in slices and, then, are called

MANGOSTEEN.

“amchur.” The kernels are also occasionally eaten.—*Powell, Faulkner, Riddell. Auslie's Mat. Med.* p. 226 and 260 quoting *Rumphius* tom. 1, Cap. XXI, p. 96. *Mason, McClelland.*

MANGO BIRD. The bright yellow Oriole.

MANGO FISH, a species of *Polynemus* of the Irawadi and Ganges. *P. longifilis* Cuv. *P. paradisæus* Lin. and *P. risua*, are splendid fish and favorites with many, are nearly related to the mullets, and the last is remarkable for the long filaments to the pectoral fins.—*Mason.*

MANGO GINGER. *Curcuma amada.*

MANGO. HIND. An edible Himalayan root.

MANGOLD. See *Chenopodiaceæ*.

MANGO-PEEL, dried mango, the Amchur; or am khnsk, or ambusi, HIND. dried mangoes.—*Powell, Handbook*, p. 338.

MANGO PICKLES, are much in use, amongst both Europeans and natives. Take about 300 green mangoes, divide into two; and dry in the sun for three days: Take of

Turmeric, ...	4½ oz.	Salt, ...	6 lbs.
Garlic, ...	3½ „	Mustard, ...	1½ oz.

and coriander seed toasted oz. 1½: mix the spices together, and lay the mixture in alternate layers with the mangoes; and add 9 oz. of gingelly oil. The green fruit of the mango is used for making chutnies, pickles and curries. Mangoes when full grown are cut into slices, dried in the sun and preserved, and they form an article of commerce; used in acidulating curries, mulligatawnies, &c.—*Herklots, Jaffrey,*

The mangosteen plant belongs to the natural order *Clusiaceæ* or *Guttiferae*, a small natural order of exogenous plants, inhabiting the hotter parts of tropical countries in both the Old and New World. Their fruit is succulent, juicy, and in many cases resembling a large apple or orange. The plant is about the size of a cherry tree and very handsome. It grows in perfection as far as 14° N. of the equator and 7° south of it. A congenial proportion of heat and moisture throughout the year seems much more requisite than soil or latitude on the successful growth of this fruit. *Malaya's neotarcod*

MANGROVES.

mangosteen, is truly a delicious fruit, and is by many esteemed as the most palatable of known fruits. It is cultivated to a considerable extent in Mergui and Tavoy and it has been successfully introduced into the Travancore province and both the nutmeg and the mangosteen, have been introduced with singular success at Ceylon, while their cultivation has entirely failed in Bengal.

Bontius thus describes this delicious fruit.

"Cedant Hesperii longe hinc, mala aurea fructus.
"Ambrosia pascit Mangostani, et nocturne Divos."

The mangosteen has never been seen in a fresh state in Europe. It becomes ripe, in Mergui, early in May. — *Crawford's Dictionary*, p. 265, *Mason's Tenasserim*, Bontius Hist. Nat. Ind. Orient. t. vii. 27, p. 115, quoted in *St. Johns Indian Archipelago*, Vol. I. p. 77. See Clusiaceæ; *Garcinia mangostana*.

MANGO TOPES, groves of the Mango tree, very numerous throughout all India. — *Tr. Hind.*, Vol. I. p. 366.

MANGOUSTE. Fr. Herpestes.

MANGO, WILD. Eng. Syn. of *Spondias mangifera*, Pers.

MANGROVES, are plants, shrubs and trees, of the natural order Rhizophoraceæ, of Lindley, and in the East Indies, the principal of them are

<i>Carallia garcinifolia</i> .	<i>Kandelia Rheedii</i> .

Mangroves abound on the coasts of the Bay of Bengal of the Indian Islands and at the mouth of the Indus. In the W. Indies, cordage is made of the bark of a species of mangrove, which is hence called Rope Mangrove. Its bark has been used for tanning purposes, for which it is probably more suitable than for cordage. The species of mangrove most abundant along the Tenasserim shores furnishes a hard and durable timber. This species is easily distinguished from its associates, for it drops no roots from its branches, but the trunk for half its height is divided into numerous roots, like a small bamboo pavilion. The black or common mangrove, the *Rhizophora mangle*, is a tree attaining an altitude of from 30 to 50 feet, and occupying marshy situations in the vicinity of the city. Almost every part of this mangrove—the bark, roots, and the fruit more particularly—abounds in an astringent principle, which is successfully applied to the purposes of tanning and dyeing. For tanning leather, nets and sails the man-

MANGU.

grove is said to be infinitely superior to oak bark, completing in six weeks, an operation which with the latter occupies at least six months, and sole-leather so tanned is said to be more durable than any other. The bark and leaves, which contain nearly as much tanning as the oak, are made use of in the West Indies, as well as in Sind and other parts of Asia. 3,713 piculs of mangrove bark, valued at £819, were shipped from Shanghai, one of the Chinese ports, in 1849. *Rhizophora mangle* which grows in the Indian Archipelago, is used in tanning, and its wood gives a red dye. The tree forms a striking feature in the physical geography of the Archipelago as it does indeed of all tropical countries, for a belt of it as deep as the reach of the tide is always found wherever there is a shallow and muddy shore. The tree rises to the height of forty or fifty feet and is invariably found in such situations constituting a dense, and almost impenetrable forest. Each tree stands on a cradle of its own roots from five to six feet high, bare at low water but as the tide rises covered so as to give the appearance of trees growing in the sea. Mangrove jungle is the favorite resort of musquitos and crocodiles, and affords a convenient and almost inaccessible retreat to pirates. The bark of *Rhizophora mangle*, is used in the East and West Indies to dye chocolate color. This was one of the colors introduced by Dr. Bancroft, and for the exclusive use of which he obtained an Act of Parliament. It is procured in plenty at Arracan, in Malabar, and at Singapore, and as it is often imported for tanning, can be readily enough obtained if found valuable to the home dyer. The bark of a small tree from the mangrove swamps is used by the Tavoy women in dyeing red, but Mr. Mason thinks only as a mordant. *Rhizophora gymnorhiza*, the *Kayu api-api* of the Malays, is used for fuel in the Indian Archipelago. The cuttings of the black mangrove or *Rhizophora* (uppn pouna), as of the white mangrove, the *Avicennia tomentosa*, (*Mada chetta*) and of the *Sonneratia* are used for firewood at Masulipatam, Mangrove bark sells at Singapore, for tanning leather, nets, and cloth, 9d. per lbs. 3-133½. — *Royle Fib. Pl.*, p. 301. *Mason. Crawford*, p. 266. *Cat. Ech.* 1862. See Mangrove, also *Rhizophora*.

MANGRUR. HIND. *Panicum antidotale*.

MANGU SUNDA. *Garcinia mangostana*. Linn.

MANGU, this wood and the *ati ati*, the *kraminan*, the *purwo-kuning* and several other woods are employed as timber at Singapore.

MANIAM.

MANGU. SUND.. Mangostin.

MANGUIAN, the name applied in Mindoro to the aboriginal tribes occupying the interior of that island. The Manguianes are a mild and ill used people, but so little advanced in civilization, that European visitors, who have not had opportunities of personal communication with the Bangan, often leave the island with the impression, that they are only a more savage variety of the same race.—*Jour. Ind. Arch. Eurl.*, p. 133. See Mindoro.

MANGUSTA JAVANICA, the mongoos of Java. See *Herpestes*, Mongoos, Viverride.

MANH? HIND. Mash, *Phaseolus radiatus*.

MANI SANS. literally precious stone. In Thibet, long dykes covered with slate slabs, engraved, with the words "Om mani Padmi om" or walls 6 feet in height and 4 to 8 in breadth, but their length varies much more considerably, the largest is 2,200 feet long on the road leading from the banks of the Indus to Leh. They are generally of loose stones, and have flag staffs at their ends. They are often of mingled heaps of broken things which are raised up in notable places and hills, as objects of peculiar veneration. Om is an often occurring word amongst buddhist Thibetans in the prayer Om! mani padma, Om Mani in Hebrew means "my portion." In passing these Mani, the Ladaki keep them on their right hand. The same is done in passing monasteries.

MANI. HIND. A weight (agricultural) = $6\frac{1}{2}$ maunds.

MANI, a Persian of the time of Shapor. He pretended to be the Paraclete promised in the fourteenth chapter of John, and soon established a sect, but was persecuted by Shapor, on which he fled to Eastern Tartary. While there, he engaged in drawing and produced a great many extraordinary figures which his followers, on his return, believed were given to him in heaven, where he informed them he had spent the time during his retreat. His religion is known to Europeans as the Manichean, a mixture of magian and hindu. Christian patriarchs and Bishops, followed him. He bluded with his doctrine the metempsychosis and the two principles of Zertusht. He was put to death by Bahram Gour about A. D. 429. Sir W. Jones however gives the date 242 as that of king Shapor of Persia.—*Jour. Ind. Arch.*, No. 8, Vol. V. August 1861. *Chalfield's Hindoostan*, p. 271. Sir W. Jones, Vol. V. p. 600. *Mosheim, Eccl. Hist.*, Vol. I. c. v. *Soerat. Schol. Lit. I.*, c. xxii.

MANIAM. In the south of India; lands held rent free or under easy conditions. Pro-

MANILLA.

fessor Wilson traces it from Many, Sanscrit, respectable. It is probably from Inam, arabic, gift.

MANI-GRAMMAM. See Jews.

MANIHAR, Maniar, or Manniar, a maker of glass bracelets worn by women, a jeweller.

MANIHOT *STARCH. Sel Cassava manioc.

MANIHOT UTILLISSIMA, POHL.

which is prepared similarly to maize and Algaroba "chirca" and Ava.

MANIK. HIND. Amethyst.

MANIKIAM. TEL. Carbuncle.

MANIKIYATLA, a small village 40 miles from the Jhelum on the high road from Attok to Lahore, a little more than half way between Attok and the town of Jhilum. It is built on the ruins of a very ancient city of unknown origin, but its position and the abundance of coins found in the ruins, admits of the assumption that it must have been the capital of all the country between the Indus and Hydaspes, a country which the ancients knew by the name of Taxila, and of which frequent mention is made in the history of Alexander. It has buddhist topes one of which was opened by general Ventura and subsequently explored by general Ventura. One tope exists at Usman Khatir, in the basin of the Indus and another at Peshawur. —*Mohan Lal's Travels*, p. 31. See Afghanistan; Inscriptions, Töpe.

MANIKYA RAI. See Inscriptions.

MANIKYAVA-CHAKAR, a devotee of Siva, a poet.

MANILA, MALEAL. *Aspalathus Indica*, Syn. of *Indigofera aspalathoides*, Vahl.

MANILA NUNA, ANGLO-TEL. Oil of *Arachis hypogaea*. Ground nut oil.

MANILLA. The capital of Luzon, and of the Spanish Indies, one of the largest of the Philippine Islands, and the seat of the Spanish Government in the east, is situated in lat. 14° 36' N. long 121° E. Manilla is on the right bank of the river. It was founded in 1581, and in 1851 contained a population of 150,000. In 1762, Roca surrendered and transferred the island to the British. It is a large city and convenient for trade, the adjacent country producing excellent indigo, sugar, tobacco, and hemp for cordage. During the months of June, July and August, febrile complaints are common. Manilla Bay is a large inlet in the

MANILLA HEMP.

south-west coast of Luzon, about 22 miles in extent each way: the city of Manilla stands on its eastern shore, about 25 miles from the entrance. The land on both sides of the bay is high. Here cock-fighting is carried to a passion unknown elsewhere. Every Manilla Indian has a game cock upon his shoulder, or tucked under his arm, or occasionally perched on his head; and when two men meet they will speak a few words, squat down, and allow their respective birds, who have meanwhile been bristling up with warlike ardour, to take a few quiet pecks at each other, which seem to refresh them amazingly, and without further comment each will go on his way, and each cock resume a peaceful attitude. Yet as there is a tax on cock fighting it is unlawful to allow the cocks to come to a regular pitched battle, excepting at the proper certified cockpits; the same with gambling out of the licensed houses: and half the convicts that are seen working on the roads in chains are doing so for the grave offence of fighting their cocks, or playing 'monte' in unlicensed places, by the roadside, or anywhere but at a government establishment. These establishments are numerous. Every village has at least one, and in Manilla there are several. The principal saints' days and Sunday afternoons are the favourite cockfighting times. The cocks are spurred with bright pieces of steel, about three inches long, and as sharp as the best razor—generally made out of old razors; and frequently both birds lie dead at the same moment. Sometimes an accidental blow from the inferior bird settles the question, for the spurs are deadly, and do not need much repetition to become effective. In general, the handsomer bird is the vanquished and the lesser and meaner-looking the hero and victor. The Indians are very cruel. Often they pluck a beaten cock alive, in revenge at his having lost, though the poor brute has been the petted and constant companion of his master for months before, and has learnt all the ways which domestic animals do learn when in hourly contact with man. Cholera occurred in Manilla in 1819.—*Literary Gazette*. See Pearls. Sulphur.

MANILLA CIGARS. See Cheroots.

MANILLA DRAGON CANES. These white and brown canes of commerce are supposed to be made from the stem of the *Calamus draco*, the dragons' blood palm. See *Calamus*, *Cave*, *Dragon Cano*.

MANILLA GRAM, Eng. nut of *Arachis hypogæa*.

MANILLA HEMP.

Abaca, Tag. | Bandala — — ?
La mot, Bisaya.

MANILLA HEMP.

The *Musa textilis* plant, which yields this hemp, was formerly introduced by Dr. Roxburgh into the Northern Circars, and during the administration of Lord Harris, Colonel, now Sir George Balfour obtained for Madras a supply of its roots. It is a native of the Philippine Islands where there are several varieties known under different names. The Abaca brava, the wild abaca, is called by the Bicoles, agotai, but the fibres of the mountain abaca only serve for making ropes, which are called by them "Agotag" "Amoquid." The Sagig and "Laquis" of the Bisaya are other varieties. Rumphius states that the Malay name of the "Laquis" is *Pissang utan*, which means wild plantain, it is called in Amboyna *Kula abbal*; in Ternate "Fuun;" and in Mindinao "Coffo:" also the cloth made from it. The "abaca" is abundant in the volcanic region of the Philippine Islands from Luzon to Mindinao, as also in the neighbouring Islands as far south as the Moluccas. It therefore extends from the equator to 20° North, and may, probably, be easily cultivated in Travancore, Arracan, Assam and Northern Circars. The mode of making this hemp at Manilla is to strip the plant, which has been cut down, of its outer covering, to rip that outer covering into slips the whole length, and, taking one end of the slip in one hand, and with the other pressing the slip firmly down on a piece of board by a strong broad-bladed knife, like a butcher's knife, and called there a *balo*, drag the slip through under pressure and thus scrape off the pulpy parts and leave the fibres, which is the hemp. Wooded districts and good soil are there considered favorable, and the best hemp comes from latitudes south of Manilla, and from several islands as far as the 10th degree. The "Abaca" should be cut when 18 months old, just before its flowering or fructification appears, at which period the fibres are shorter and finer and they are said to become weaker afterward. It is cut near the roots, and the leaves cut off first before their expansion: it is then slit open longitudinally and the sheathing layers removed, as it is from them that the fibres are formed as in all the plantains. The fibres from the outer layers are harder and stronger, and form the "bandala" of commerce, which is employed in the fabrication of cordage. The finer fibres from the inner layers are called *lupis*, and the "nipis" and other delicate fabrics are made from them: while the intermediate layers produce the "tupos" which are made into cloths and gauzes of different degrees of fineness and four yards long, and

MANIPUR.

are universally used as clothing. When well scraped, shaken and washed, the fibres require to be dried and picked, and those for cordage require no further preparation, but the fibres to be employed by the weavers, are made up into a bundle and made soft and pliant by beatings with a wooden mallet, their ends are then gummed together as is done with pine apple fibre, and they are rolled up for the loom. The stuffs, when woven are soaked in warm water, (or lime water) for 24 hours, after which they are soaked in cold water then put into rice water and lastly washed as before, by which means they acquire lustre, softness and a white colour. Some are dyed into blue or red colours, some are embroidered: and they seem in Europe to be confounded with grass cloth. Manilla rope was sold in England at a net price of £32 per ton, on the average of the ten years prior to 1852; but it rose in that year to £44 and £50 for the average kinds, and in the rise in 1854 it was quoted at £70 to £76. Dr. Oxley of Singapore states that the *Musa textilis* grows freely in Singapore.—*Royle, Fibrous plants*. See *Musa textilis*.

MANILLA NOONA, TEL. Ground-Nut Oil, the oil of the *Arachis hypogæa*, or Manilla-nut, which yields the Ground-nut or Manilla nut oil or Ground-nut Oil.

MANILLA TAMARIND, *Inga dulcis*, *Willd.*

MANI MAHES, a holy lake, beyond the Ravi.

MANI-MAL, See Kandeñ Rao.

MANI-MANI. MALAY. Beads.

MANIMANOTI—? Ground Nuts. Earth-nuts.

MANIOC or Manioca and arrowroot are both rather extensively grown in the maritime provinces of Ceylon, the former being inferior in quality to that grown in the West India islands. From the manioca, the Singaporeans prepare a fine flour resembling arrowroot, but much sweeter and far more nourishing. Boiled or baked with milk it forms a most delicious meal partaking of the nature of a rich custard. See Arrowroot, Cassava, Climate.

MANLOOPOO. TEL. Potash.

MANI-PASUPU, TEL. *Coscinium fenestratum*, *Coleb.*

MANIPUR, lies to the south of the Naga districts eastward of the Kuki area and on the drainage of the Irawadi. Munnipore is, from its connection with the British Government, and from the tribes around it all admitting its supremacy, the most important of the Hill States on the South East of Bengal. Lying between latitude 23° 50'

MANIPUR.

and 25° 30' north, and longitude 93° 10' and 94° 30' east, the mountain tract in question is bounded on the north and west by the British provinces of Assam and Cachar, and on the east by the Kubbo valley now subject to Burmah. To the north-east and south, the boundary is not well defined, and would much depend upon the extent to which the Munnipore government might spread its influence amongst the hill tribes in those directions, but in the north-east, it may be denoted by a line drawn north from the north-western corner of the Kubbo valley until it strikes the Assam boundary, and in the south by one drawn west from the source of the Numsailing river, the fixed south-east boundary, till its junction with the Tooyai river.

Of the space comprised in these bounds, the valley of Munnipore occupies nearly the centre. It is called by the Munnipore people, "Mei-lei-thei-pak." The Burmese call it Ka-the, the Bengalees Moglai, and Assamese Mekle. The area of the whole territory is about 7,000 square miles, and that of the central valley about 650. Much of the valley is at all seasons, covered with water. It seems indeed at one time to have formed a large lake, and the piece of water in the south, called the Logtak, appears to be the unfilled, but rapidly filling, remnant of it. From the most credible traditions, the valley appears originally to have been occupied by several tribes, the principal of which were named Koomul, Looang, Moirang and Meithei, all of whom came from different directions. For a time, the Koomul appear to have been the most powerful, and after its declension, the Moirang tribe.

Of the population, composed of different classes, the principal is the Mei-thei, next the Phoong-nai, after whom the Teng-ken, the Ayok-pa, the Kei, the Looe and Mussulman. The Mei-thei population is divided into four parts called "Punnah," which are designated in the order of their seniority "Kaphum," "Jai phum," "Ahull-oop" and "Nihar-oop." The Looe population consists of people who pay tribute, and is considered so inferior that the name Mei-thei is not given to it. The marshes of the south in the vicinity of the Logtak afford a retreat to serpents of a formidable size, and the whole valley of Munnipore is much infested by the serpent tribe. Some of them are exceedingly active and bold, as the Tanglei. It is fond of ascending bamboos, along the branches of which it moves with great velocity, and if enraged, throws itself from an extraordinary height upon the object of its anger. Its bite is said to be mortal. This, added to its great activity and fierceness, makes the Tanglei an

MANIS PENTADACTYLA.

object of much dread. The Manipuri native tribes lie on the south of the valley of Assam. They are the

Manipuri,	Ka-pwi,	Maram,	and
Songnu,	Koreng,	Champhung	Luhuppu.

They are bounded on the east by the Shan of the Kynduayn, and on the N., S., and W. by the Naga and Heuma. Indeed it may be doubted whether there is any marked transition from the Manipuri tribes and dialects to those of the southern Naga, on the one side, and those of the Yuma range and the Blue Mountains on the other.

The inhabitants of the hills around the valley of Manipore, in the west, are known under the general appellation of Naga and Kooki. In Manipore they are all embraced in the term Hau, but Koupoocce, Quoireng, Khongjai, Kamsol, Anal-Namfan, Aimole, Kom, Koireng, Cheeroo, Chote, Pooroon, Muntuk, Karum, Murring, Tangkool, Loo-hoopa, Mon, Muram, Miyang-khang, Gumei are the names in use amongst Muni-pori to distinguish the principal tribes, though each of these tribes has a distinctive name of its own, often quite different from the Muni-por one. McCulloch's *Records Government of India, Foreign Department* pp. 10, 34, 41. *Latham's Descriptive Ethnology*. See India, Kuki, Singho.

MANIS AURITA. Hodgson.

M. Javanica, Blyth.	M. pentadactyla, Hodgson.
Scaly ant eater, SIKKIM.	Ling-li, CHIN.

This manis occurs in Sikkim and extends thence through the Indo-Chinese countries into China itself, the Chinese name means the jungle carp. It is sold in the markets of Canton, where its flesh is considered excellent and its scales medicinal.—*Jerdon*.

MANKA. In the 8th century, hindu physicians went to Baghdad, and practised at the hospitals. Two of them named Manka and Sulch, were the physicians of Harun-ur-Rashid.

MANKAI, HIND beads or cut agates, pebbles for signet rings.

MANKADU. In Penang, a wood of a brown color, much used for beams.

MANKARI, nobles, persons entitled to honor or distinction.

MANGKASAR, the territory in the island of Celebes known to Europe as Macassar. Celebes consists of a small irregular central area, with four long peninsulas. The two on the south are separated by the Gulf of Boni; in the S. W. peninsula, two languages are spoken, the "Mangkasa" or "Mangkasara," (of which word the Netherland capital, Macassar, is only a corruption by the Dutch), and the "Wugi" or "Bugi" which originally was more particularly limited to the coast of the Gulf of Boni. North of Macassar, in the most western part of the island, is another people, the "Mandhar," who speak a third language. On the island of Baton, which may be regarded as a part of the peninsula east of the Gulf of Boni, a fourth tongue is spoken. In the northern peninsula are the people speaking the "Gorontalo" and the "Menado" languages. Minahassa is in the northern extremity of Celebes. In the interior are a people whom the coast tribes call Turaju, who are said to be cannibals, and head hunters. This was stated many years ago by Dr. Crawford, who says (Vol. i. p. 243) "some of the savages of Borneo destroy their prisoners and devour their flesh. One nation of Samatra acquainted with the art of writing and possessed of books, are well known to be cannibals. Among other tribes, the skulls of enemies are held as trophies round their habitations. Among the people of Celebes, when an enemy falls wounded on some occasions, they actually devour his heart, and there is hardly a warrior of note who at some time or other has not partaken of the horrid repast. Dr. Crawford had seen several who had done so, and one person told

MANGKASAR.

him it did not differ in taste from the offal of a goat or buffalo." Macassar is the most notorious place in the Eastern Archipelago for the Bugi people to run amok. On the average, one or two occur in the month. It is in fact amongst the natives of Celebes, the national mode of committing suicide, and is therefore the fashionable mode of escaping difficulties. Ten or twenty persons are sometimes killed and wounded at one of the amoks. Stabbing and killing at all he meets, the amok runner is at last overpowered and dies in all the excitement of battle. It is a delirious intoxication, a temporary madness, absorbing every thought and action. Macassar men is a common name of the Bugi race. The Macassar people were taught mahomedanism in the early part of the 16th century, but the Portuguese arrived A. D. 1525, and they embraced christianity. The Bugi are now the great navigators and traders of the Eastern Archipelago. In the beginning of the western monsoon, they go in great numbers to the Arru islands, which is the principal rendezvous for the people of Ceram, Goram, the Ki islands, Tenimber, Baba, and its adjacent coast of New Guinea, a distance from Macassar of upwards of 1,000 miles, and the return cargoes are tortoise-shell, mother of pearl shell, pearls, birds of paradise, and tripang, the Malay term for all the kinds of *Holothuria* or Sea Cucumbers. Of tripang alone, about 14,000 piculs are yearly shipped from Macassar, of a value of 600,000 dollars, or £150,000. It is estimated that the annual value of goods carried by the Bugi to the Arru islands, from Macassar alone is 80,000 dollars, or 200,000 guilders, and of those taken to the Arru group from other places 20,000 dollars, or 50,000 guilders. The Bugi are the most enterprising race of the Eastern Archipelago. Although they bear some personal resemblance to the Malays, arising probably from a common origin, in every quality, but that of a piratical spirit, they are essentially different. Exposed to the same temptations, and most skilful and adventurous navigators, they have never adopted the occupation of piracy, but abhor and resist it, and defend themselves against the Malay prahus with the most heroic and desperate valour whenever they are attacked, proceeding, if overpowered, to blow up their vessels, rather than submit. The poorest of these hardy islanders is as impatient of a blow as a European gentleman; and it is permitted to any one to avenge an affront by the death of the person who offers it. A more than Spartan training is bestowed on children. The lads at the age of five or six are removed from their parents, lest they should be made effe-

MANNA.

minate by indulgence, and they are not restored to their family until they are of an age to marry. The Bugi are the Phœnicians of the Indian Archipelago, and there is not a coast from the northern shores of the Australian continent to the Malay peninsula where their ships are not habitually seen. These adventurers leave their country in the beginning of the eastern monsoon on a trading voyage, and proceed westward until they reach Singapore. With vessels of peculiar build, of from forty to fifty tons burthen, they conduct almost the whole carrying trade of the Archipelago. They own at least 1,000 ships, the outward cargoes consisting of their own manufacture of cotton cloths, English calicos, arrack, Chinese gongs, gold dust, edible bird's nests, tortoiseshell; trepang or sea slugs for Chinese epicures, scented woods, coffee, and rice; and in spite of the jealous and restrictive policy of the Dutch, they have greatly contributed to diffuse British manufactures throughout the islands of the Eastern Seas.—*Professor Bickmore Travels*, 97, 99-101, *Wallace, Archipelago* i, 174. *Quarterly Review*, No. 222.

The manna of the south of Europe is the

MANNA.

concrete juice of the *Ornus Europæus*, a species of ash, the *Fraxinus ornus* Linn, but *F. gar gavia* and *F. rotundifolia* Lam. are also supposed to yield it. *F. florifera*, the *Ornus florifera* or flowering ash tree, grows in the mountains of the south of France, and *F. rotundifolia*, the *Ornus rotundifolia* or round leaved manna ash tree, is a native of Calabria and Sicily. Other sweetish secretions are exuded by some other plants of those regions and are usually considered to be kinds of manna. These appear to be all produced in warm and dry parts of the world. Of the manna obtainable in Central Asia several kinds are used in native medicine. One of these in the form of small dark grains, is the "turanjabin," said to be derived from the *Allagi maurorum*; another, somewhat whiter, is the "shirkhist" or "shaklu," which is believed to be produced in Cabul by a species of *Fraxinus*; and lastly, the "shakar taghar," which is a round cell, resembling in shape a small gall, and said to be produced by the puncture of an insect on the *Calotropis procera*, the "akli" or "mandar," it has a sweet taste.

The shir-khist is the best kind known in India, and is said to be procured from a tree of Khorasan, perhaps a species of *Fraxinus*; the Turanjabin, is the produce of *Allagi maurorum*; the Guzunjbien, of a tamarisk, *Shakar-ool-ashur* is produced on *Calotropis procera*, or a kindred species and a fifth kind is mentioned as being obtained on an umbelliferous plant.

The manna of ancient Assyria (*Exod. xvi. 15, 31, 33* and *35*: *Numb. xi. 7*), in Turkish, is called kudrat-ul-halwassa, or the divine sweetmeat, is found on the leaves of the dwarf oak, and, also, though less plentifully, and scarcely so good, on those of the tamarisk, (the *Turfa*, of the Arabs) and on several other plants. It is occasionally deposited on the sand, and also on rocks and stones. The latter is of a pure white colour, and appears to be more esteemed than the tree manna. It is collected in the early part of spring, and again towards the end of autumn; in either case the quality depends upon the rain that may have fallen, or, at least, on the abundance of the dews, for in the seasons which happen to be quite dry, it is understood, that little or none is obtained. Mr. Rich, (*Vol. i. p. 142*) seemed to think this rock product is another kind of manna; but Mr. Nassam, considered it to be the same, with the simple difference of being free from the leaves and other impurities taken up with it, when shaken from the trees or plants. In order to collect the manna, people go out before sunrise, and having

MANNERS.

placed cloths under the oak, larch, tamarisk, and other shrubs, the manna is shaken down from the branches. The Kurds eat it in its natural state as they do bread or dates, and their women make it into a kind of paste, being in this state, like honey, and it is added to other ingredients used in preparing sweetmeats, of which all oriental nations are fond. The manna is partially cleaned, and carried to the market at Mosul in goat-skins, and there sold in lumps, at the rate of 4½ lbs. for about 2½ d. But, before using it, it is thoroughly cleaned from the fragments of leaves and other foreign matter by boiling. In the natural state, it is of a delicate white colour, or, as in the time of the Israelites, like coriander seed, (Num. ii. 7) and of a moderate but agreeable sweetness, and Calmet compares it to condensed honey. Burkhardt, however, says it is of a dirty yellow colour, slightly aromatic, of an agreeable taste, sweet as honey, and, when eaten in any quantity, it is purgative; he adds, that the time of collecting it lasts six weeks. Under the Persian *mannos gaz* or *gaza* a glutinous substance, like honey, deposited by a small green insect upon the leaves of the oak tree is much used for making sweetmeats in Persia. It is a manna of the chemist. *Gazanjabin* is a manna produced on branches of the *Tamarix indicus* by the punctures of the *Coccus manni*. This is often called Arabian manna to distinguish it from *Turanjabin* Persian manna and from the *Shir-kistor* Khorassan manna and from Sicilian manna.—*O'Shaugnessy*, p. 434. *Powell, Hand Book*, Vol. p. 320. *Royle Ill. Him. Bot.* p. 267. *Ferrier Journal. Diod. Sic Book xvii Chap. viii*, See *Kudrathlavassi*, *Calotropis*.

MANNA TREE of Australia. *Eucalyptus viminalis*.

MANNATTAN, MALEAL. A washerman.

MANNEN-CHUNG, CHIN. *Chiarita sinensis*.

MANNERS and ways of the races in the East Indies are as diversified as are the nations dwelling there. The domestic customs of the mahomedans have been described in the *Kanoon-i-Islam* by *Jafir Sharif*, and much connected with the household ways of hindus has been noticed in Mr.

MANNERS.

Forbes Ras-Mala of Guzerat, in *Baboo Ishwari Doss* in his *Domestic Manners and customs of the hindus of Northern India*, in the Reverend Mr. Ward's view of the hindus, and in the *Abbe Dubois Manners and Customs of the people of Southern India*. Derived, as the modern hindus are, from several distinct branches of northern races, of the Scythic or Tartar and Aryan stems, numbers of their domestic customs differ, but the most prominent manners result from their marriage laws. The hindoo woman, on becoming a wife, ceases to belong to her parent's family, and becomes exclusively a part of the household of her new home. Another domestic custom results from the family institution prevalent throughout nearly all the hindoo races in India, in which every individual of a family, has a share in the family property, sons live with their fathers long after they are married, paying certain portions of or all their earnings towards the support of the whole family. Wealthy hindus living in large cities have great buildings made of stone, or of baked bricks, of two or three stories high, with rooms all around and an open court in the middle. The roofs of these houses are flat and smooth and people sleep on them at night in the hot season. The doors are of board and when closed the rooms are quite dark. Some rooms in the interior of the building are dark even in the day time when the doors are open; and when people have to do any thing they use lights. In such dark rooms they keep their money, jewels, and other valuable things. The reason why these apartments are so dark is that there are no doors in the back part of the house;—the principal gate and the doors of the rooms being in the front. Houses in the country are made mostly of mud, but they are strong and comfortable, according to the hindu idea of comfort. They are mostly one story high, and their height is about six or eight feet. The roofs of some have tiles, others are thatched, and again others have roofs of mud,—these latter have beams or pieces of timber close to each other, on them thin branches of certain shrubs are spread, as dunnages and over these mud is thrown and pounded so as to make the roof smooth, it is then plastered. Some houses are two stories high, but the rooms are very small. Wealthy landlords have comparatively large houses, often three stories high, and have larger rooms. In all the houses, each room has only one door to go in and out and that door is just high enough for a man to enter. Four, five or more houses are found in a little yard, laid out in the form of a

MANNERS.

square or triangle or circle with an open space in the middle, where the members of the different families (who are of course related to each other) sit and talk, and where cattle are kept in the cool of the day in the hot season. Each house has two or three small rooms; one of these is exclusively used for the kitchen, and the others for sleeping and keeping things. Besides these rooms there is generally a small verandah in the front of the house where they keep water and where women sit during the day. There is a room at the door or gate of the yard, where men sit when they are not at work and where strangers and visitors are received. Strangers go into the yard, whenever there is occasion but never without asking permission, and always with somebody that belongs to the place.

Hindus may be said to have no furniture, no chairs, nor tables nor chests, nor any of those other things that are seen in the houses of Europeans. The usual furniture in their houses consists boxes or round baskets with covers and locks to keep their clothes and jewels and cooking utensils, the plates and jugs out of which they eat and drink, and the bedsteads and beds on which they sleep. Even wealthy hindus, who are possessed of hundreds of thousands of rupees, have no more than this. There may be perhaps found one in ten thousand, who keeps a few rough chairs and an old ugly table in a corner of the house. In Calcutta, Bombay, and Madras, wealthy hindus have European furniture in their houses, but this is not the case in the provinces. A hindu is known to his neighbours to have wealth or to be in comfortable circumstances by the house he lives in, by the quality of the raiment that he and his family wear, by the jewels that the women of his family use, and the number of his cooking utensils and plates which are made of brass, but more especially by the last two, namely, the jewels and the brass articles. These are valuable, and a thief would sooner break into the house of a rich hindu than into that of a wealthy European, unless the latter has a good deal of cash and plate in his house. From the houses of the former, he could carry away brass pots, plates, jugs, and particularly jewels to the value of hundreds or even thousands of rupees, but in the house of the latter, he would generally find only chairs, tables, book cases, chests, and other wooden things which would not be of the least possible use to him. Hindus that are poor have earthen pots to cook in and have wooden dishes and a brass jug to eat and drink out of. Those that are in somewhat better circumstances

MANNERS.

have a few brass pots, plates, and jugs. The love between the hindu wife and her husband, is seen in the husband's anxiety to support his wife and make her as comfortable as he can, in the wife's efforts to manage her household affairs with prudence and make her home attractive and comfortable to her husband, and also in her anxiety when the least thing troubles him in body or mind. Though a hindoo husband believes his wife to be an inferior being, yet he does not look upon her in the light of a slave or servant. On the contrary, he habitually maintains the belief that there is a sort of equality between himself and his wife, and all that he possesses in this world, whether wealth or land or honor or any thing else, is supposed by him to belong to his wife also. In general, however, wives have more of real love to their husbands than husbands have to their wives, and husbands after their death are still remembered with a degree of affection by their widows. Whether widows would remember their departed husbands with the same love were they universally allowed to marry again, is doubtful. But all husbands can marry again when they lose their wives. There are bad husbands and bad wives, but the chief sources of grief in a hindoo household, are supposed or suspected conjugal infidelity in the wife, or a naturally bad temper in one party or both. In the marriage ceremonies the vows between the pair are singularly suggestive. After many tedious ceremonies the bride's pandit thus addresses the bridegroom: "The bride says to you—'If you live happy, keep me happy also; if you be in trouble, I will be in trouble too; you must support me, and must not leave me when I suffer. You must always keep me with you and pardon all my faults; and your pooja, pilgrimages, fastings, incense, and all other religious duties, you must not perform without me; you must not defraud me regarding conjugal love; you must have nothing to do with another woman while I live; you must consult me in all that you do; and you must always tell me the truth. Vishnu, Agni, and the Brahmins are witnesses between you and me.'" To this the bridegroom replies,—“I will all my life time do just as the bride requires of me: But she also must make me some promises. She must go with me through suffering and trouble, and must always be obedient to me; she must never go to her father's house unless she be asked by him, and when she sees another man in better circumstances or more beautiful than I am, she must not despise or slight me.” To this the girl answers,—“I will, all my life time, do just as you require

MANNERS.

of me; Vishnoo, Agni, Brahmins, and all present are witnesses between us." After this the bridegroom takes some water in his hand, the pandit repeats a prayer, and the former sprinkles it on the bride's head, then the bride and the bridegroom both bow before the sun in worship. After this the bridegroom carries his hand over the right shoulder of the bride and touches the region of her heart, and then puts some bundun (a coloured powder) on her mang or the line on her head, and puts his shoes on her feet, but immediately takes them off again. The marriage is now over and the pandits put a red mark on the foreheads of the bride and bridegroom, bless them, and take their dues. All other brahmins also, who are present, receive something. Amongst the hindoos of the south of India, the bride and bridegroom circumambulate the family fire, and the bridegroom, as the last act, takes the bride's foot and places it on the family altar. Amongst the hindoos, physicians who depend for their living on the art do not, in general, meet with a fair remuneration. When they are called to see a patient, they cannot settle beforehand what they will take for their trouble as this would be deemed extremely impolite. When the patient recovers he gives them a trifle. Some patients, who call at a physician's house for aid, give him nothing. This has tended to make hindoo physicians mean and leads them to unfair ways of remunerating themselves. Among hindoos, when a traveller friend arrives at a house he is saluted with great warmth and reiterated questions are put concerning his own and his family's health. This done, he is asked to smoke tobacco, and fire is brought in a little earthen tray by the man of the house and is given to the guest, who has his own hooka, if he be of another caste. After smoking and talking about different things, such as absent relations and so forth, the guest thinks of cooking his food. If he be of another caste, he cannot eat with the family, and the host gives him either from his house or from the market the necessary articles, which are, flour, dal, salt, ghee, red pepper, and fuel. Turmeric, garlic, and other stuffs are not used by travellers on account of the trouble of pounding and bruising them. If the guest have his own utensils he uses them to cook in and eat out of, if not, the host gets them for him. If the host belong to one of the lower castes, and the guest to one of higher ones, he must not give him his own utensils, but must get them from some neighbour, who is of a better caste. When there is a well in the court, the guest cooks his food in a verandah be-

MANNERS.

longing to the house of the host; but when there is none, he goes outside to some well and cooks by it, for the sake of having water at hand, as he cannot use the water that the host has in his house. The chief meal of the day, is usually at 8 p. m. After dinner is over, the guest and host and other male members of the latter's family sit together, and smoke and talk to a late hour in the night. When they retire, the guest sleeps either in the public room where men sit and visitors are received, or in a verandah. He leaves in the morning, and is expected to do so. When a host has a guest of the same caste with him and of the same subdivision, water is on his arrival given him to wash his hands, feet, and face; and he cat^s with the family. He is also expected to leave in the morning. When a guest is a near relation of the host, great attention is paid him; everybody in the house tries to make him comfortable; water is soon brought for him to wash himself; he has constantly fresh charges of tobacco; and, regarding food, women do for him all their best. However, the arrival of such a guest, if he be a somewhat elderly man occasions some inconvenience to the women of the family, and especially to those whose husbands are younger than the guest, because they cannot move about freely while he is there. But when the guest is young, the women carry on many a joke with him. The arrival of guests who are distant relations is not agreeable to the women; partly because they may not be able to move about freely; and partly because they have the trouble of cooking for him if he arrive at an unseasonable hour; but another cause is that the family has to feed him while he stays there:—women perhaps feel more in parting with things than men, and if the guest be a distant relation and not a particular friend of the family, his speedy departure is wished for by men as well as by women. There is a saying on this point current among people, —Do din ki mahmani, tisre din ki be-nani, which means "a guest is entitled to the rites of hospitality for two days: if he remain a third day, he is breadless." A striking characteristic of the hindoos, is their fondness for mela, or religious fairs. The thorough enjoyment which the women and children express on such occasions, is singularly attractive. They are to the hindoo what the Derby is to the European; But though religious fairs are a part of the hindoo religion, hindoos do not show the least seriousness in them. They are excessively fond of attending mela; but this excessive fondness arises for the sake of the fun or amusement and to enjoy the sight of hundreds of thou-

MANNERS.

sands of human beings of all classes. Hindoo women, of all degrees of beauty and in dresses of every approved colour, appear in public and the mahomedan inhabitants of cities, (there are comparatively very few out in the country) flock to a hindoo religious fair to gaze. Fond as men are of attending the mela, women are still more so. If a man were prevented from going to a mela, he would not think much of it, but this would be a great trial to a woman and would furnish a subject for talk for sometime. The spectacle rather than religion is the spring that sets them in motion. If the place where the fair is held be quite near to their home, the family start from home on the morning of the fair, but if it be at some distance they leave it one or two days before. Before they leave home, all the members of a family, but especially the women and children are in a great state of happy excitement; it forms all the while the most important part of their talk. The last day that they are at home, the women are chiefly engaged in making preparations for it by dressing food to be used on the way and at the mela. These dishes consist of thin soft cakes of wheat flour with or without salt and sweet preparations of the same flour, sugar, spices, and vegetables, all dressed in ghee. The poor, however, prepare them in oil. Dishes cooked in ghee and oil can be removed out of the kitchen (chauka) and eaten anywhere, provided they are not touched by people of very inferior castes. Food thus dressed is called pak'ha khana, or food that attaches no ceremonial uncleanness by removal from the kitchen, and food which is not, wholly dressed in ghee or oil is called kachcha khana, or one that attaches ceremonial uncleanness by a removal. Hindoos take their meals in kitchens or in a place adjoining them.

The day that they start for the mela, men and women all attire themselves in their best cloths, and the latter at this time put on all their spare ornaments and jewels, which they do not daily use when at home. The wealthy inhabitants of cities get conveyances (Bablee) drawn by bullocks, horses or ponies for themselves and the women of their families, and men and women often have separate vehicles. Town people who, though not wealthy are yet in tolerably easy circumstances, get conveyances for their women and children; but they themselves walk. The poorer women and children walk. Many of the people living in the villages, keep clumsy carts (chhakra) which on such occasions they use for the conveyance of their women. Such carts are kept to carry

MANNERS.

grain, timber, &c., and have no covering like the bullee,—vehicles meant to carry passengers; but a temporary covering is drawn over them whenever required. Thousands, sometimes hundreds of thousands of human beings,—men, women, and children, on foot, in vehicles, and on horseback, with a very few on camels and elephants, are seen flocking to the place of general resort. Women attired in dresses of various gay colours, as well as in white muslin sheets, walking in all the pride and bravery of their tinkling ornaments, which assail the ear on every side, children dressed in their finest clothes with silver and gold rings about their wrists and ankles, walking or riding with their parents with smiling faces, and men with white or dyed turbans and caps, and mostly long coats and the dhotee cloth of the lower limbs with swords, staves or substantial sticks in their hands,—altogether make up one vast stream hurrying in the same direction and mingling in an immense sea of human beings already congregated. So soon as people reach the mela they put up for the time that they are to be there under some tree (when practicable) which in the day protects them from the heat of the sun and at night from the dew. There are very extensive mango orchards in India, in which hundreds of thousands of people can take shelter. Very often three or four families take shelter under one tree. Those that have carriages keep their things in them: those that have not, put them on the ground. Women of respectable families that have come in carriages may have kept themselves screened from public gaze while on the way, but so soon as they arrive in the mela this screening is over. They alight from the conveyances before the crowd, and do not cover their faces with the veil that goes over their head and around their bodies as they would do when seen walking in a street towards a river to bathe. The concealment of women from public view was not originally a hindoo custom, but was brought into practice at the time of the mahomedan government. At the present day it is not a general practice among the hindoos, but is kept up by those people of the Kayast'h caste and a few other that are much in the company of mahomedans and have adopted a few of their manners and customs. Most of the bathing and other religious ceremonies take place before breakfast, after breakfast, the men go about the mela to see things and amuse themselves, they purchase a few play things for their children and also one or two articles for their women if requested. Women in general remain under

MANNERS.

the trees singing and gazing and wondering at the vast assemblage of human beings around them. Those of the middle and lower classes pay a visit to some shops where they purchase a few trifles for themselves, such as small looking glasses, rings and bracelets of glass or lac, little bells for their toes, and so forth. In northern India some of the women of the sweeper caste are very beautiful, especially among those who live in cities and do not undergo hard labour and are not exposed to the sun, which in a country life cannot be always avoided. The minutest points in daily life are regulated and regarded as part of a religious duty, washing the mouth after food, is a duty strictly enjoined in the Indian law, which rigidly enforces personal cleanliness.

"Having slumbered, having sneezed, having eaten, having spitten, having told untruths, having drunk water, and going to read sacred books, let him, though pure, wash his mouth."

The mahomedan or mussulman races in British India are in number about seventeen millions. In their domestic life, within doors, the mahomedans of the E. Indies, approximate to Europeans more than the hindoos, and, unless when moved by religious excitement, their various sects are more friendly amongst themselves than the castes of the hindoos ever are. The hindoos, adhering very closely to the institution of the family, are liberal to each member of their own families, but they are distrustful as to the purity of their nearest relatives, and hindoos of a higher caste would never bestow alms on a pariah or helot. The mahomedans on the contrary, are eminently generous, and deem it a duty to bestow the tenth part of their property in alms, the "Zakat," of the Arabs, and they are enjoined to avoid inquiring with over minuteness as to the religious belief of a professing mahomedan, but to be content with the profession and the pronunciation of the creed. The half of the hindoo men, in their proper daily attire, use unsewn cloths as garments, and the women similarly, but mahomedans have sewn apparel, and most of their wives use trowsers. A hindoo of any pretensions to birth abstains from many vegetables and eats apart, many of the sects do not allow the glance of a stranger to fall on their food, and their wives are either absent or stand while their husbands eat, and only dine after the husband is satisfied. But a mahomedan sits with his wife and family, and if, while he is eating, a stranger approach, he is invited to partake, and the invitation is accepted by eating at least a mouthful. Hindoo cookery is little varied, and per-

MANGLI.

haps three-fourths of all the hindoos in India, abstain from the use of animal food, and many vegetables are prohibited, but the mahomedan pulao are numerous and diverse; their mixture of grains called khichera, their bread or roti, their pastry, their roasts or kabab, their curries or salun, their broths, soups, sweet-meats, pickles, and condiments and their use of vegetable and animal food are of the most varied kind. The hindoo is essentially an idolater—a believer in spirits and in transmigration. But the mahomedan is a monotheist and believes in the future state of rewards or punishment. The temples of the hindoos have images in and around them of uncouth or unnatural figures, the gateway or gopuram of the temples are covered with nude figures; and the chief idol is daily worshipped by the deva dása, or slaves of the god, who receive any stranger that seeks them, but the interior of a mahomedan mosque is devoid of all ornamentation and the worshippers attention is reverentially absorbed in prayer to the unseen God.—*William's Story of Nala. Institutes of Manu, v. 145. Herklots, Qanooni-Islam, by Jafir Sherif. Forbes' Raza-Mala of Guzerat. Ward's View of the Hindoos. See Burial. Marriage.*

MANNI. TAM. A bell.

MANNI, HIND. Of Multan, a filter used in making saltpetre.

MANNING, Thomas, an Englishman who reached Lhasa from Calcutta in 1811, but was arrested and sent back by the Chinese, he died without publishing any particulars of his journey.—*Yule, Cathay I. p. 149.*

MANNO-DIARA, KARN. Laborers who execute heavy work, such as heaving blocks of stones, constructing earthen walls, &c.

MANNIPUR or Kassay, a hill state, generally mountainous, 5000 to 8000 feet above the sea, lying between the British possessions in Silhet and the Burman territory on the river Ningtee. Its valley is 2,500 feet above the sea, 36 miles long and 18 broad. It was ravaged by the Burmese and has never recovered. Its population is almost 20,000. Its present capital is Chandrapore. It is the readiest route to China by Bamo. It carries on traffic with Ava down the Ningti. See Manipur.

MANNU, also Kain, HIND. of Hazara, the elm, *Ulmus erosa* also *Ulmus campestris*.

MANNUTTHA-KALEE, TAM. *Solanum incertum*.

MANRA or **Manra**. PUSHTU. *Pyrus malus*, the apple tree.

MANSAROWARA LAKE, is east of the Ladak frontier and north of Gurhwal and Kemaon. About it lie the sources of both the Indus and the Sutlej, and to the east lie the heights that separate them from the drainage of the Tsan-pu. While the Sutlej and Indus run westwards the Tsan-pu flows eastwards to the north of the northern frontier of Nepal and Bhutan until it turns to the south and west and becomes the Brahmaputra of the great valley of Assam. On the head waters of the Sutlej and Indus, in the provinces of Radok, Garo and Gunge, the elevations are higher than those of Ladak and the alluvial soil of Gunge is remarkable for its depth and extent. At the source of the Tsan-pu may be seen the physical features of Tibet, in their extreme form, but Mang-yul, the district through which it runs in its upper course is less known than any other part of Tibet. Further on, however, when to the north of Bhutan, there is the district of Lhasa or the capital of the province, U, and Tassoudon of Tsang. The parts between Lhasa and Assam, like the parts along the Nepal frontier are unexplored, but warm alluvial patches of land do exist. The route between the Mansarowara lake and Lhasa, via Tadam and Katlunandu, which is described at length by Captain Montgomerie in a special report, extends over a distance of upwards of 1,200 miles.—*Cunningham*. MANTAPA, SANS. the vestibule or proscenium of a hindoo temple. The temple door is usually very large and decorated, it is called the Gopuram. The Mantapam is the proscenium, an open raised pavilion, for receiving and sheltering idols when carried in procession.—*Wils. Gloss*.

MANTARWE. See *Ban-teah*.

MANTCHU, a Tartar race, who, at present, are the rulers of China. The original seat of the reigning Mantchu Tartar dynasty is the north-east of China. Klaproth gives a list of 61 Mantchu tribes. The number of Mantchu troops is estimated at 80,000 men. They are habitually under arms, and are assiduously exercised in their profession. The government watches over them with great anxiety, for the emperor has a strong interest in not allowing these troops to stagnate in inaction; he takes care that they shall preserve something at least of the warlike character to which they owe their conquest of the empire. The Mantchu Tartars forbid marriage between those whose family names are different. In this respect, they differ altogether from the brahmins of India who abstain from marrying into families with their own race name. Chevalier Bunsen remarks as the first lesson which the knowledge of the Egyptian language teaches, that all the nations which, from the dawn of history to our days, have been the leaders of civilization in Asia, Europe and Africa, must have had one beginning. He adds that recent inquiries have very considerably enlarged the sphere of such languages of historical nations, as are united by the ties of primitive affinity. Those researches have made it more than probable that the Tartars, Mantchu and Tungusian belong to one great stock; that the Turkoman, as well as the Tshudo, Fin, Laplander and Magyar (Hungarians) present another stock closely united, and that both these families are originally connected with each other. These nations, who probably may be reduced to two families, one centering in the Altai and

MANTIS.

the pasture land towards the Himalaya, and the other having its centre in the Ural mountains, have acted in the history of civilization a most powerful episode by conquest and destruction. They appeared in the fifth century as the Hun, a scourge to Romans and Germans; they produced Chengiz Khan, Timur-lung and Mahomed II.; they destroyed the Persian empire, subdued Hindustan, and they still sit upon the throne of Byzantium and upon that of China. They seem destined to partake only by conquest in the higher civilization of the surrounding nations, older or younger ones, the Chinese presenting the one extreme, the Iranians the other. Little disposed to learn from them as neighbours or subjects, they become more or less civilized by being their masters. They cannot resist the inward force of the civilization of their subjects, although they repel it, as an outward power. These tribes appear also as the once subdued substratum of Iranian civilization. So in the north of Europe, where the Finnic race preceded the Scandinavians. But the same great family appears also in Asia as the subdued or primary element. It seems probable, that the aboriginal languages of India, which attained their full development in the Dekhan dialects, belong to this stock, not only by a general analogy of structure, but also by an original and traceable connexion. This is one of the two great races occupying the Chinese empire, Chinese and the Tartars, the latter being the ruling people. The Chinese have annexed all the parts neighbouring on China proper, from Mantchu and Mongol races. The dynasty is Mongol and the army Mantchu, and furnishes Mantchu soldiers in Mongolia, Tibet, and Kanton. *Sturanton's Narrative*, p. 4. *Wade's Chinese Army*, pp. 3 to 48. *Hue, Chinese Empire*, Vol. I. p. 404. *M'Lennan*, p. 146. *Arago's Letters*. *Freycinet's Voyage*, Vol. II. p. 17. *Lubbock Orig. of Civil.* p. 103. MANTHEA. Sp. Manteiga, PORT. Butter.

MANTELES ALEMANTISCAS, Sp. Diaper.

MANTIS, several species of this genus of insects occur in India, *M. superstitionis*, *M. aridifolia*, and *M. extenuicollis*. *M. tricolor*, *Nilapar*, the mantis of the coffee tree, is green, lower wings reddish, with large blackish spot at the posterior margin. The female is 1 inch long with $1\frac{1}{2}$ inch of an expanse of wings. The male is considerably smaller. The eggs are deposited upon coffee leaves, in cocoon like masses, of $\frac{1}{2}$ of an inch in length

MANU.

but drawn out further at each end. The Mantis religiosa, amongst the peasants of Languedoc is held almost sacred, they call it the Prega Deori, or Prie Dien.

MANTRA SANS. Counsel, hence mantri, SANS. a Counsellor.

MANTRA, HIND. SANS. A formula, or litany, in use in invocations of the hindus. There are many of these. That of the Srisampradaya or Ramuja sect of vaishnava is said to be "Om! Ramaya namah," Om! salutation to Rama. The mantra generally consists of the name of some deity or a short address to him; it differs with various sects, forms the chief ceremony of initiation of the hindus of all sects, and is communicated by the teacher to the disciple in a whisper and many mantra, or formulae of prayer, are supposed to have a magic power. The gaettri prayer, is a passage in the Veda, and is deemed the holiest in all that sacred book, one of the most holy books of the hindus. Its words are in Sanscrit and are O'M! Bhurbhuvā ssvāhā, O'M! Tatsavit'irṇ varennyam. B'hargo dévāsyā dhimahi dhizoyonaha pricho dāyāth,—the translation of this prayer being O'M! Air, Earth, Sky. O'M! let us meditate on the supreme splendour of the divine sun: May he illuminate our minds. See Aryan. Charm. Hindoo. Tantra. Veda.

MANTRA MAHODADHI, see Tantra.

MANTUNG, a river near the Khassya Hills.

MANU, according to hindu tradition, the primeval man, son of the sun (Vivasvat). In the primeval Iranian world, however, Jima or Jemshid was the primeval man.

The name Mann is applied to a great legislator of the hindus. In the Indian version of the deluge, Manu is the survivor of the human race, and the second ancestor of mankind. The first Mann is named Swayambhava, and sprang from Brahma the self-existing. From him came six descendants or other Manu, each giving birth to a race of his own. The hindus believe their great code of laws to have been promulgated in the beginning of time by Manu, whom they consider not only the oldest, but the noblest of legislators.

MANU, is the name given to the author of the Manava dharma sastra, comprising the Indian System of duties, religious and civil. It is a volume of religious rules and precepts. It is called the Institutes. It inculcates the worship of inferior gods and goddesses, of the elements and of the heavenly bodies, and the casts of brahmins is held thereon in great reverence, the Institutes

MANU.

are, however, supposed by Bunsen to be a patchwork posterior to Buddha and it may be accepted as a recognised fact that this law book undoubtedly preceded, or was at least contemporary with, buddhism. But it is also posterior to Kapila for the philosophy is that of the Sankhya to a certain extent, and it is probable that the 6th century B. C., the date given by Professor Wilson as that of this compilation is the correct one and the book as it has come down to us seems merely an abbreviation of a far larger and more ancient one. The law book of Manu opens with an account of the creation and goes through the category of every difficulty in which a man, a state, or a community can possibly be found. It embraces the whole duty of man and of men, religious, political, social, domestic and private: the duties of monarchs are laid down with as little ceremony as those of the humblest panchalla. It was verbally translated from the original, with a preface by Sir William Jones, about A.D. 1770, and this, with the subsequent sanskrit text by professor Haughton, and the translations of Haughton and Loiseleur Deslongchamps, made this book known in Europe. Professor Wilson is of opinion that the Institutes of Manu though disfigured by interpolations, and only cast into their present form in about 200 B. C. are still entitled to date many authentic portions of their text from 800 B. C. which was the estimate of Sir William Jones. In fact, the Institutes of Manu are a compilation of the laws of very different ages; many are word for word the same as the sutra of some of the oldest rishi. There are various unquestionable proofs of high antiquity: the people of Bengal, Orissa, and the Dravira race of the south were not hindus, when one passage was written, and Dr. Caldwell places Dravira civilization through the brahmins six or seven centuries after Christ. There is no mention of, or allusion to, Siva or Krishna, which places parts of the work before the Mahabharata—there is evident familiarity with the Veda, persons and legends being alluded to not found any where else. All such passages we could consent to consider at least as old as 800 B. C. On the other hand there are many references to the merit of Ahimsa "non injury of animal life," and these are probably later than buddhism—and there is mention of the China race a name that sinologists say, is not older than two centuries B. C. It is believed that the work may have been put together at that time though very much of it is a great deal older. The present estimation of the Laws of Manu is somewhat different from that of Sir William

MANUFACTURES.

Jones. Many of the laws are doubtless extremely ancient, in the same way that the laws "Thou shalt not steal" and "Thou shalt not kill" date back in all probability to the primeval period when man first became a living soul. It thoroughly recognises caste. It is not included amongst the sutra or "sacred revelations," but amongst the Smriti or "traditions." Indeed the term Smriti implies "recollections," a name which seems to indicate pretty precisely the character of the code of Manu. There is a form and completeness about the work which indicates that it was compiled long after the age which produced the Pentateuch; and, judging from its intensely brahminical character, we should place it nearer to the Puranic age than to the period when the elemental worship, as exhibited in the Vedas, was the religion of the people of India. In a word the Laws of Manu are not to be illustrated by the Vedas, but by the Puranas; they belong not to the religion of the patriarchs, but to that of the priests and kings. The Vedas exhibit the oldest form of the hindoo religion, with which we are familiar, and that was nothing more than the worship of the elements, of Agni or fire, of Indra or the rain-giving firmament,—of Varuna, or the waters,—of Vayoo, or the wind,—and of some minor deities. Amongst the first items of information we receive on hindu history is in a passage in Manu which gives us to infer that the residence of the Aryan race was at one time between the rivers Saraswati (Sersety) and Drishadwati (Caggar), a tract about 100 miles to the north-west of Delhi, and in extent about 65 miles long, and from twenty to forty broad.—*Prin. Ind. Int.* p. 223. *Elphinstone, History of India* Vol. I p. 388. *Englishman, Newspaper, September 15.*

MANU BANGHA, Sans. from mana, honour, and bāghā, destruction.

MANUEL FARIA DE SOUZA, author of *Asia Portuguesa*, &c. Lisbon, 1666.

MANUFACTURES. There are but few arts or manufactures, in which Eastern nations excel those of Europe. Perhaps in spinning and in the weaving and dyeing of cotton and silk stuffs, of such kinds as are suitable for the clothing that they wear and to their habits, the weavers and dyers of South Eastern Asia are not approached by any European race. In field and garden cultivation, in the economy of water and the utilization of manures, there are several races skilled in varied degrees, though none exceed the Chinese in their knowledge of these subjects, to their acquisition of which they are stimulated by the example of

MANUK-DEVATA.

the imperial family, the emperor annually ploughing the first field and the empress and her attendants watching the silk worms and their produce. The little permanency, since eight hundred years, of any Indian dynasty, has prevented architecture attaining the position of which it was capable, and, in general, are to be seen the results only of spasmodic efforts of hindu and mahomedan sovereigns, such as still exist in the ruins of palaces, and tombs at Agra, Bejaporo, Aurangabad, Gogi, Kulburghah, Dowlatabud, and Hyderabad. The hindu sovereignties of India and, prior to them, the buddhist and jaina rulers were of longer duration, and the vast cave temples of Promo, Karli, Elephanta, Ellora, and Ajunta testify to the stability and power of their projectors, for some of these temples must have been in progress for hundreds of years and been commenced prior to the birth of Christ. The only Indian sovereigns who have long possessed territories are the rajput races of Rajputanah, and the solar dynasty of Mewar have erected numerous magnificent structures in their capital. In the towns of Calcutta, Madras and Bombay, there is as yet no building older than the British rule of any interest. In Ceylon, the buddhist temple of Anarajapura seems to have been erected prior to the present era. At Rangoon and at Promo are buddhist temples, grand in their colossal dimensions, but the dwelling houses and religious buildings generally in Burmah are all of wood and do not permit display.

MANUGIRI, BENG. Colocasia Indica.

MANUHR or loho-ki-mail, slag or dross of the iron furnace, used in medicine.

MANUK, BENG. Colocasia Indica.

MANUK, MALAY. a bird; any bird.

MANUK-DEVATA or Burung-devata, MALAY. Jav. lit. bird of the gods, or bird of paradise. The high value set upon them awakened the cupidity and the fraud of the Chinese, who made up from parrots, parakoets, and others, artificial Birds of Paradise. Their various names are Manuk devata Malay. lit. God's birds: Burong mati Malay. Dead Birds: Passaros de Sol, Portuguese, or sun birds and the English name is Birds of Paradise. They are unknown in Ternate, Banda or Amboyna. The Paradiseidae are a group of moderate sized birds, allied in structure and habits to crows, starlings and to the Australian honey-suckers, but they are characterized by extraordinary developments of plumage which are unequalled in any other family of birds. Many naturalists arrange them into two families, Paradiseidae and Epimachidae. Para-

MANURE

disea apoda, *Linnaeus*. Bird of Paradise, has a dense tuft of long and delicate plumage which comes out from each side of the body, from beneath the wing, sometimes two feet long very glossy and of an intense golden orange colour.—*Wallace*, II, 267.

MANURE. The productiveness of any soil depends principally on its natural or artificial capability of retaining or transmitting its moisture, the vehicle, at least, by which the nourishment is conveyed to plants; the soil, whose constituent parts are best adapted for retaining a sufficient supply and transmitting a proper portion in very dry weather to the plants growing in it, without holding it in injurious quantities in the time of very wet weather, is possessed of the principle of vegetation and will be found to be of the most productive nature. The too tenacious clay soils must be made artificially friable, by drainage and the admixture of marls, sands, &c., and kept so, and be pulverized and mechanically altered, before they can become productive. Until this is done, such soils resist effectually the enriching influence of rains and dews, which merely fall on their surface, and either run off or lie there without penetrating into them. The sun and wind also may beat on them and blow over them, but they can never waken up the dormant energy that lies within; they only by their repeated attacks dry and harden the surface, crack it into irregular portions; and more firmly lock up any languid and dormant principles of vegetable life that may be within the mass. When clay is in excess, it is remedied by the application of sand, chalk, marl, or burned clay, light unfermented manures, and perfect pulverization, to make the soil friable. There are in soil eleven substances necessary for the growth of vegetables, viz., potash, soda, lime, manganese, alumina, silica, iron, manganese, sulphur, phosphorus, chlorine, and soil is composed of two classes of ingredients—one, the inorganic or mineral; the other, the organic, or such as have at some time formed parts of individuals of the animal or vegetable kingdoms. Certain phosphates, though present

MANURE.

in soil in the smallest quantity, are its most important mineral constituents and are derived principally from the animal kingdom and the following substances procurable in considerable quantities in India may be employed as manure. Animal manure, stable manure, both fresh and old, dung of all animals. Guano, poudre, night soil, bones of all animals, fresh, calcined or merely crushed, burnt earth, dead animals blood of animals hair, hoofs, horns, parings of skins, offal, urine, feathers, fish and the quickest way to utilise animal substances is to throw them into a stone-lined tank with water, quicklime and wood ashes, the tank should be kept covered and the liquid parts may be run off from below. Weeds green, dry and burnt, branches and leaves of trees both fresh and dry, the leaves of oil producing plants, and those that contain milky juices being the best, as they yield nitrogen, ammonia and carbonic acid. Rotten wood, tan-bark. Straw, stubble, roots—&c. Lime, burnt shells old mortar, gypsum, refuse of soda water, sulphuric and nitric acid, manufactures, broken bricks and tiles, silt and sand from tank and river beds, marls, soda, potash, and magnesian earth, road dust, house sweepings, wood ashes, coal ashes burnt cowdung, muriates, carbonates, sulphates, nitrates and acetates of potash and soda, soot, gas, liquor and sulphate of ammonia, phosphate and superphosphate of lime, tartrates and acetates of iron, refuse from dye works, leaf mould leaves both green and dry if steeped for a week in water, decay afterwards much more rapidly, and the brown liquor that comes from them is good liquid manure; the leaves should then be laid in alternate layers with earth and half burnt weeds, and the heap should be covered with matting to prevent the escape of the moisture and gases. If watered and turned once in ten days, the leaf mould will be fit for use in three months keep dung heaps covered and dilute liquid manure in them with one or two waters, by which the escape of ammonia will be in a great measure prevented. Liebeg, a soil, says will reach its point of exhaustion sooner, the less rich it is in the mineral ingredients necessary as food for plants. But we can restore soil to its original state of fertility by bringing it back to its former composition, i. e., by restoring to it the constituents removed by the various crops of plants. A fertile soil must contain in sufficient quantity, and in a form adapted for assimilation, all the inorganic materials indispensable for the growth of plants. It is obvious for instance, that we furnish the conditions essential to the formation of starch

MAO.

or of sugar, when we supply to the plant their necessary constituents, i. e., such as we find always present in them. The sap of such plants as are rich in sugar or in starch contains much potash and soda, or alkaline earth. As experience proves that a deficiency of alkalies causes a deficient formation of woody fibre, sugar, and starch and that, on the contrary, a luxuriant growth is the consequence of their abundant supply—it is obvious that the object of culture, viz. a maximum of crops, cannot be obtained unless the alkalies (necessary for the transformation of the carbonic acid into starch or sugar) supplied in abundant quantity and in a form fit for assimilation by plants. In fact, the principle object of scientific agriculture is to restore to land in whatever way the restoration may be most convenient the substances removed from it and which the atmosphere cannot yield." Professor Johnston says lime is indispensable to the land; every thousand pounds of fertile soil contains 56 lbs. of lime; every thousand pounds of less fertile, 18 lbs.; and of the barren soil, only 4 lbs. Vegetable matter i. e., woody fibre, in the state, technically called "humus," according to Liebeg, does not afford nourishment to plants in the form in which we see it in soils, being, in fact, very nearly insoluble, and therefore incapable of being taken up by the roots, which cannot take up any solid matter, but only as the carbon. A mixture of two or three earths, such as lime, silica, and alumina, is better fitted to absorb moisture and gaseous matter than either of the earths taken singly.—*Den. As. Soc. Journ.*, No. clxxxix., April 1843.

MANUS or men, descendants of Mann.

MANUS or Mann, fourteen patriarchs who are supposed to preside successively over the same number of Manwantara of which the kalpa is composed Brahma Savarni is one of the fourteen patriarchs who are supposed to preside successively over the 14 Manwantara of the kalpa.—*Warren, Kala Sanhita*. See Mann.

MANU-VAI-VASWATA, according to the hindus "the man of the sun" is Noah.

MANYI, HIND. *Ulmus crass.*

MANY-SPINED FLACOURTIA, Eng. *Flacourtia cataphracta*.

MANZAKHTA, HIND. *Rubus lasiocarpus*.

MANZAL, AR. HIND. PERS. A halting place, a stage of a journey, a dwelling house, a storey of a dwelling house.

MANZANILLA, Sp. Camomile.

MAO, JAP. China grass.

MAO, also Man, also Mangas, MALAY. *Mangifera indica* the mango tree, and its fruit.

MARAGHUNE.

MAOOKADOON — ? *Nauclaea cadamba*, Wall.

MARA KANDA. See *Arians*.

MARAL, also *Marali*. HIND. *Ulmus campestris*, or elm, also *U. erosa*.

MARAL, PERS. *Cervus walliohii*, Ouw. The deer numerous on the banks of the Oxus, near Said, of which a splendid pair of antlers were procured by Lieut. Wood, are probably of the maral species. Moorcroft also noticed them, and enumerates lions and tigers among the animals of that neighbourhood; the lion being similar to that of Guzerat. According to Burnes the tigers of Bokhara are small.

MARAM, a rude tribe near the source of the Irawadi. See *India*.

MARAM, TAM. A tree; any tree.

MARA MANJIL, or *Woniwol* or *Bangwellgetta-Coscinium fenestratum*, (*Menispermum fenestratum*), Bombay, furnishes a yellow dye.

MARA, MT. See *Khyber*.

MARANMAT, AR. HIND. From imarat a dwelling, at mahomedan courts, equivalent to the Public Works Department.

MARA MUNJIL, MALEAL. TAM. *Coscinium fenestratum*, *Coleb.*

MARANDA, TAMIL a tree of Ceylon, furnishing one of the best wood, very heavy and close grained, of a dark-brown colour, and grows to about twenty inches in diameter, and twenty feet in height.—*Eidye, Cey.*

MARAN-GASS, SING. *Acmena Zeylanica*.—*Wight*.

MA-RAN-MA, the Burmese name of *Burmah*. See *India*.

MARANGGAI, MALAY. *Hyphernanthera moringa*.

MARANTACEÆ, the Arrow-root tribe of plants, includes 3 genera and 28 species viz. 7 *Phrynium*; 5 *Maranta*; 16 *Calathea*. In the West Indies, arrow-root is obtained from the *Maranta arundinacea*, *M. allongia*, and *M. nobilis*; also from the *Canna glauca* and *C. coccinea*: to both of which the local name of *tous les mois*, or *tulema*, is applied. In the East Indies, arrow-root is prepared from the *Maranta arundinacea*, also from *M. ramossissima*, a Sylhet species. The *Maranta arundinacea* was introduced in 1840-1841,

MARANTA MALACCENSIS.

into Butnagberry, where it thrives extremely well, though it is not grown to any extent. It was also introduced into the Tenasserim Provinces, and the arrow-root made from it was not inferior in quality to any. *Maranta arundinacea*, is largely grown in Travancore, at Chittoor near Arcot, in the Tenasserim provinces and at the Andaman Islands. Mahabaleshwar arrow-root is obtained from *Curcuma caulina*, *Graham*. Travancore arrow-root is obtained mostly from the *Maranta arundinacea*, but the fecula of *Curcuma angustifolia* and of the cassava-meal from the *Jatropha manihot* is likewise sold under that name. *Curcuma angustifolia* is also the source of an arrow-root prepared at Benares, Bengal and Chittagong. A wild arrow-root plant grows in Cuttack and arrow-root made of it is not distinguishable from that of *Maranta arundinacea*, except, perhaps, by a slightly earthy taste and smell observable in the wild arrow-root, which is easily accounted for by its imperfect manufacture. Genuine *Maranta* arrow-root, when pressed, crackles beneath the fingers. The *Curcuma* or "East India" arrow-root, as exported to England, principally from Calcutta, has a white and a brown variety.—*Voigt. Roxb. O'Shaughnessy. Cat. Ez. 1862.*

MARANTA ARUNDINACEA, *Linn.*

Pon-bwa, Burm.

A native of the West Indies but now grown in many parts of the East Indies. This produces the best West India arrowroot which is prepared by maceration of the roots in water, and conducting the further processes similarly to the mode of manufacturing starch from wheat, potatoes or other starchy substances.—*Voigt.*

MARARI also Marazh, HIND. *Ulmus campestris.*

MARAS, See Tin.

MARASCHINO. *This liqueur, chiefly manufactured in Venice, Trieste, and Zara in Dalmatia, is prepared from a variety of cherry, named the Griot marasquin; the fruit and seed are crushed together, one part to the hundred of honey added, and the whole mass subjected to fermentation; during this process it is distilled, and the product is rectified. To the rectified spirit sugar and water are added, in proportions guided by the taste of the manufacturer, and the resulting liqueur is stored for some months before use, to free it of empyreumatic flavour. The fruit tree is the *Cornus caproniana*.—*O'Shaughnessy, p. 323.*

MARATHA, the Maratha people, consisting chiefly of Marathubrahmans and Kumbi, owing to the prominent and powerful position so long occupied by them in India have imposed their language and some of their customs on about twice their own number of menial and helot races, such as the Dher, and Mang who, Marathas in Nagpur, speakers of Hindi in the Nerbada valley, only retain their individuality because they are too low in the scale for absorption. Maratha influence, did not penetrate to the north much beyond the Nagpur plain, consisting of the lower valleys of the Wardha and Wainganga. To the south of this area the Telug races are intermingled with the settlers from the west though not in large numbers: to the east there is Chattisgarh, inhabited, after some fifteen centuries of Rajput ascendancy, mainly by hindu races, except in the remote eastern district of Sambulpur, which, by language, belongs to Orissa. The northern line of demarcation may be drawn along the southern crest of the Satpura range, for though a few Marathas are found on the table-land, there are probably more Hindi speakers below the ghats in the Nagpur plain, and the almost universal language of the three Satpura districts Seoni, Chindwara, and Betul, is Hindi. The northern limits of the region in which the

MARATHA.

Marathi language is spoken stretches on the sea coast from the Kolwan hills, or country of the Kol near the Portuguese settlement of Daman, above the ghauts in a north-easterly direction along the Satpura range parallel to the Nerbudda, intermingling with the Gujarati, about Nandobar, in the jungly valley of the Tapti. It is spoken throughout Berar, in the open parts of the territories of Nagpur and the whole of its eastern border abuts on the countries and languages of the Gonds. From Nagpur, the Marathi extends to the south-west, and near the villages of Murghpetta and Ninni, about thirty miles west of Beder it meets with the Telugu, and Canarese, touching, in advance nearly on Bijapur and Shankash-war, and thence trends south-westerly to the coast at Sidasheghur, skirting the western boundary of the Canarese. From Daman in the northern Konkani, Marathi runs down the coast to the neighbourhood of Goa, both below and above the ghauts. It there meets the Konkani, a mixed tongue which runs nearly as far as Mangalore, and the southern limits of this mixed language is a village four miles north of Upi or Oodapi near Condapore, where Tulu or the language of Canara begins. The Konkani, however appears to be only Marathi with a large infusion of Tulu and Canarese words, the former derived from the indigenous inhabitants of Tuluva or Canara; the latter from the long subjection of this part of the Konkani to Canarese dynasties above the ghauts. Mr. H. Mögling however mentions that the Konkani speaking brahmins of Mangalore, consider it quite distinct from, though cognate with, Marathi. The limits extend from Goa below the ghauts, to the village above-mentioned north of Upi. From this part of the coast in northern Canara, a diagonal line running in a north-eastern direction towards Bader, marks the boundary between Marathi and Canarese, of the latter at least above the ghauts.

From Murghpetta, however, eastwards through Beder ou to Sangam near Sedashepet (Satyassi) the people designate the line of villages and towns as Si-bhasha-basti, three-tongue-towns, for in them the Marathi, Canarese and Telugu mingle, though in all that line the people seem rather of the Maratha than of the Canarese or Tiling type, as far as Sedashepet, 20 miles further east, where the Tiling people and Tiling tongue alone occur.

The Maratha people are supposed to have been originally a race of mountaineers, in Baglan, on the crest of the ghauts, and culti-

MARATHA.

vating the fertile valleys or mawal: and the country called Maharashtra, which is first mentioned in Indian history in the Mahawanso, probably obtained its name and received a distinctive language from the existence of a Marathi dynasty at some period not recorded in history. The Maratha race are essentially mountaineers, herdsmen and soldiers, and, until lately, were deemed bad farmers.

The races and tribes and fragmentary nations dwelling in the Maratha country are numerous, with many immigrants. The most prominent are the Kunbi cultivator, the village authorities, amongst whom are the Mhar and Mhang, as predial slaves, the mahomedans, the brahmins and the Parsee. The races daily seen are,

Brahman, Deshast'h or Maratha, and Koukani.	Mahomedans, in every avocation.
Kunbi, cultivators.	Sempi, or tailor.
Kulgargi "	Juhai, or weaver.
Wani, Langnet cultivators.	Wattan, or bangle-maker.
Manwar, cultivators.	Kumhar, or potter.
Baghwan, or Mali, gardeners.	Sutar, or carpenter.
Goliwar, keep sheep and goats.	Sonar or goldsmith.
Komti, banya, merchants, generally grain merchants, they wear the sacred thread, and are in several sections.	Lohar or blacksmith.
Teli, oilmen, oil-makers and oil-sellers; many are of the linguet sect; some of their sections are deemed impure and must not enter sacred places.	Dhobi or washerman.
Jain, shop-keepers.	Kullal, palm-wine drawers.
	Hajam or barber, unclean.
	Burud, Bamboo basket-makers.
	Kaikari, palm-leaf do.
	Chanar, leather workers.
	Dher or Mhar, or pariah.
	Mhang or tanner.
	Thakur.
	Gosai.
	Byragi.
	Jangami.

In the Mahratta Dekhan, the municipal system is still very perfect and the servants and village authorities are known as Balute. The individuals and trades or professions, composing the village officers and servants vary, however, in every district. In some are the

Potail.	Bhisti.	Taral or Yeskar.
Jangam.	Gharpagari.	Dauri Gosain.
Ramusi.	Mhar.	Garsi or piper.
Bhil.	Gondhali.	Bajantri.
Koli.	Teli.	Kalavantin.
Mali or Baghban.	Tambuli.	Vaidya.
Darji, Suti, or Sui Sonar.	Bhat.	Ghotakhor.

The village accountant is known as

Patwari,	M.H.R. Conicopilly,	Tax.
Kulkarni,	CAN. Karnam,	Tel.

and is usually a brahman. He keeps the village accounts for Government and sends same to the tahsildar. The Mahratta village head is the Potail, who rents the lands to cultivators, collects the Government land tax, and forwards it to the tahsildar. He is also

MARAUDU.

the civil magistrate, and settles petty civil matters to the extent of two mounds of grain or five or six rupees, and sends higher claims to the tahsildar. In criminal matters he is only the police, and sends all to the amin. In lieu of pay for the above services, the pottail is allowed from 25 to 50 bhignahs of land rent free, the land tax is about Rs. 3 or 4 the bhigah. For the cultivation of this allotment two to four bullocks would be needed, as 10 to 16 bhigahs, according as the rains are heavy or light, are all that a pair of bullocks can get over. There are generally two to four pottails in a village, not always of the same caste; for instance the village of Khanpur, zillah of Naulair, has four pottails, two Maratha, a Canarese speaking language, and a Kulkarga. There are a few brahman and mahomedan and pariah pottails but a christian pottail is unknown. In the Canarese speaking country the village head is called Goura or Gouda.

The Maratha Kunbi race chiefly worship the deified heroes Kandoba, and Hanuman. The temple of Kaudoba near Poona is famous. Punderpoor on the left bank of the Kistna river is a celebrated place of pilgrimage and there is a famous temple and image of Ganesha at Morganim and a tree, said to be 300 years old, is, an object of great veneration, on the belief that, 100 years back, the leaves had the virtue of turning into gold on being taken to Benares.

The establishment of a Mahratta government at Nagpur drew many of the nation into that part of Gondwana, and made their language general for a considerable distance round the capital.—*Central Provinces Gazetteer, Elphinstone's History of India*, p. 411. See India.

MARATIGO. See India.

MARATI MOGGA, also Marati tige, BEV. TER. *Spilanthus acmella*, R. iii 410 Dr. Roxburgh applies the same name to *Cissus vitifolia*, i. 406—Brown describes it as a certain aphrodisiac drug. Heyne gives mandi as a Sanscrit name of this plant and Buddata ramu as the Telugu.

MARATI MOGGU. TAM. *Illicium anisatum*, Linn.

MARATINA, TAM. A Ceylon tree, about twenty inches in diameter, and fifteen to twenty feet in height, used by the Singalese, for house and boat work.—*Edye, on the Timber of Ceylon*.

MARRATTIA ALATA. See Ferns.

MARAUDU, TAM. A Ceylon tree, grows to about twenty inches in diameter, and twenty feet in height furnishing one of the best Ceylon wood, very heavy and close grained, of a dark brown colour.—*Edye, on the Timber of Ceylon, Fröh.*

MARAYA.

MARAVA a race in the extreme south of India, in the Ramnad and Sivaganga districts who differ from other neighbouring races in personal appearance and their language and customs also differ. They worship local deities to whom they offer liquor, flesh and fruits, and they practice divination. The men do not wear turbans. They possess lands. They are a robust, hardy, dark-skinned, stalwart race, athletic, with well developed muscles, active, of moderate height, the cranium rounded, narrow in front, forehead low; eyes large and full. They occupy parts of the Madura and Tinnevely districts, are employed as village watchmen and are honest to their employers, but have been largely given to thieving and gang robbery. They use, as food, the flesh of all animals except that of the cow. They wear their hair long and arranged like the women of the Dekhan. In their marriages, dispruity of age is not considered, nor is the presence or assent of the bridegroom necessary,—a blade of wood, in his absence, serving as proxy. They worship evil spirits, to whom they sacrifice, and, on the occurrence of a small pox or cholera epidemic, the whole village is excited and devil dances are common. The Maravar women of Ramnad and Sivaganga, wear cloths of 25 or 30 cubits in length, folded in plaits which they fasten behind. This is unlike other women of S. India whose cloths do not exceed twenty cubits and are fastened on the right side in front. They intermarry, some of the subdivisions not marrying into the father's family,—but hindus in general intermarry with the mother's relations. In Ramnad and Tinnevely, the titular surname of all the Maravar is Dever.

The Ramayan describes the forest or wilderness of Dandaca as covering the whole extremity of the southern peninsula, and the rude inhabitants are designated Rakshasa (monsters) or vanara (monkeys) the former term meaning races or tribes hostile to the Arian race. But vanara is from vana a wilderness and nara a man, that is a wild or uncivilized man, and to this sense, as to the wild races in the extreme south, the fable of Hanuman, the chief monkey and that of his army, Mr. Taylor thinks may be reduced. He says that those who have seen the Collieri and Marava will readily consider them to differ from all family likeness of the Arian hindus, and as their visages often resemble baboons more than men, it would require even less than the ardent poetical imagination of a Valmiki to induce the employment of an equivalent word which would so aptly seem to convey the idea imparted by their appearance. Orme, the historian, relates that the Maravar

MARBLE.

chief of the Collieri race, in 1752, sent 4,000 peons and Collieri to aid Chanda Sahib. Like the Ramusi of Sholapore and Bombay the Marava are subsidized by being employed as watchmen of houses. The zemindar of Rammed is a Marava. Maravar marriages are sometimes of an incomplete character and they have a second and more complete one. Maravar or Marava, is perhaps the Marullo of Cosmas Indicopleustes, which was on the continent adjoining Ceylon and produced conch-shells.—*Yule Cathay*, i. p. 81. *Rev. Mr. Taylor in Madras Government Records*, 1867 p. 4. *As. Soc. Journ. Orme's Hindustan*.

MARA-VERI, TAM. A Ceylon tree much the same as the Velveri in size and quality. It is used for natives' huts &c., but is not of much value.—*Edge, on the Timber of Ceylon*.

MARAVULLI, TAM. *Janipha manihot*, KTH.

MARAWANG. See Tin.

MARBLE.

Marmer,	DUT.	Marmo,	IT.
Marbre,	FR.	Pualain: marmar,	MALAY.
Marmor, GER. LAT. RUSS.		Sung-i-marmar,	PERS.
Marmar,	GUZ. HIND	Marmol,	SP.

Marble is the granular limestone, or carbonate of lime of mineralogists. It is hard, compact, of a fine texture, and readily takes a fine polish. In colour, some marbles are quite black, others again are of a snowy white; others are greenish, grayish, reddish, blueish, or yellowish, and some are variegated and spotted. The finest solid marbles are those of Italy, Blackenburg, Franco, and Flanders.

(a.) Marble of one plain colour.

Black marble, most of these marbles contain bitumen, and are fetid when bruised as the Namur marble, the marble of Ashford in Derbyshire, Dent in Yorkshire, near Crickhowell, Tenby, Kilkenny, the marble, anciently called Marmor Luculleum, and now Nero Antico, &c.

White marble, as the marble of Paros, in which the Laocoon and Antinous are executed; Carrara marble, of finer grain, much used in modern sculpture; the Skye marble noticed by Dr. McCulloch; that of Inverary, Assynt, Blair Athol, &c.

Ash and Gray marble as the beautiful marble of compact oolitic texture at Orelton, near the Clae Hills in Shropshire.

Brown and Red marble as the Rosso Antico; and marble near Buxton. The mottled brown marble of good quality of Beetham Fell, near Milnthorpe.

Yellow marbles as the Giallo Antico. Siena marble dug at Mafra, near Lisbon. That used in ancient Rome is said to have been from Numidia.

MARBLE.

Blue marble, near St. Pons, in Languedoc. Green marble, as the Marmor Laccedaemonium of Pliny, dug near Verona.

(b.) Marbles of two colours.

Black marbles variegated with other colours occur near Ashburton in Devonshire, Torbay in the same county, Bianco, Nero Antico. The Africa Breccia of the ancients, Giallo and Nero Antico.

White marbles variegated with other colours occur in Italy, Siberia, at Plymouth, at Killarney, in Sweden, &c.

Ash and Gray marbles variegated with other colours, are very numerous, and occur in various parts of Europe.

Brown and Red marbles variegated with other colours.

Yellow marble variegated with other colours.

Green marbles variegated with other colours, as the Egyptian marbles—the Marmor Tiberinum and Augustum of Pliny; some Verde Antico, as that dug near Susa in Piedmont, the beautiful marble of Anglesey (called Mona marble), the marble of Kolmerden in Sweden.

(c.) Marble with many colours occurs near Plymouth, and is the beautiful Brocattello or Brocade marble of Italy and Spain.

(d.) Marbles containing shells, corals, and other extraneous bodies.

The blue clouded marble slabs of China are about a foot square, and are exported to India, Sydney, South America, &c. for pavement or floors. It is obtained to the northwest of Canton: there is also a red breccia marble brought to Canton, which is employed in tables, stone stools, &c. and is seldom sent abroad. The marbles of the Madras Presidency are of rare colour, and fine quality. Specimens sent to the Great Exhibition of 1851 were favorably reported upon as indicative of a valuable material, well adapted to sculptural and ornamental purposes. At present the Indian manufacture of this article is comparatively insignificant and chiefly confined to small miscellaneous articles for domestic use. The pure white marble of Tinnevely is in large crystals like that of Burmah. The marbles of the Cuddapah district are of greenish colours from pale apple green to deep leek green, and beautifully shaded; they attracted attention in the Exhibition of 1851. At Bhara ghaut, on the Nerbudda ten miles from Jubbulpore, on the line of the railway to Bombay, a white saccharine marble is plentiful and easily accessible. It has been used in a limited degree at Jubbulpore, sometimes to make lime, and other times for metalling roads. It is made up into images

MARBLE.

by natives, but does not take a good polish. Nevertheless, a block which was sent to the Paris Exhibition of 1855 was pronounced to be equal to Italian marble for statuary purposes, very large slabs can be easily quarried. The granular white marble from Korhadi, 3 feet by 2 and 9 inches thick, is Rs. 2. So soon as the navigation of the Godavery is opened up, this marble and the sandstone and coal of the same locality with the alabaster, gypsum and dolomite of Jubbalpore, will probably become articles of export. At Tinnevely, also, there is an excellent white marble, but considered rather too hard for statuary purposes, and Guntoor and the Ceded Districts abound with marbles of great variety of colours, being tints of grey, yellow, and red. Marble occurs at Attok. Both white and grey occur at Nooshky. The marbles and building stones, and the red sandstone so commonly seen in all ancient buildings from Benares up to Lahore, were formerly imported from these parts and magnificent mosques, tombs, and shrines, yet remain to tell us of that trade.

The marble used by the Burmese in the manufacture of their numerous figures of Gautama for the pagodas, &c., is obtained from the marble quarries in the small steep ridge of the Tagyen hills, near the village of Mowe in the district of Madaya. The great mass of the limestone forms the summit and eastern face of the hills, and here are situated, all the quarries from which the marble has been extracted. The limestone rests upon hornblende gneissose rocks, which form the lower portion of the hills and is for the most part tolerably pure and massive, but occasionally has an imperfect lamination, given by flaky plates of mica arranged in lines of the mass. It is, in the mass, of nearly a pure white and is largely and finely crystallized. Portions of it have a delicately blue tint, while others are stained by ferruginous spots. A block suitable for a figure three feet high can be had at Amarapoora for about fifty tikals or about £8, and a figure of these dimensions may cost about 150 tikals, or about 180 Rupees = £18. Large blocks can now rarely be had, the largest obtainable do not now average more than four or five feet long by two or three feet thick, but even these are not frequently obtained and are expensive. For smaller blocks there is a constant demand. The marble workers are settled at Amarapoora and Mogaing. With a hammer and chisel, the workman rapidly gives a rough outline to the mass, and by occasionally, with a few lines of charcoal, marking out the drapery and limbs, he rapidly completes the figure.

MARCO POLO.

Partly owing to the delicate tinge of blue and to the generally large crystallization of the mass, there is a peculiar semi-transparent look about the finished sculptures which has most probably given rise to the general notion that these images are of alabaster. Pallagoix speaks of the beautiful marble he found in the island of Si-Hang on the coast of Sium polished as brightly by the waves of the sea as it could have been by the hand of man.—*Report upon the Marbles of Southern India by Edward Balfour, in Government Central Museum, Madras. MARCO POLO, was of a noble Venetian family, Nicolo and Matthew, two brothers, had mercantile establishments at Constantinople and in the Crimea. They quitted Venice, for the East in 1254, left Constantinople in 1260, and passed through Bokhara to the court of Kablai Khan who sent them back as ambassadors to the Pope and they reached Acre in 1269, when Nicolas found his wife long dead but his son Marco grown to 15 years of age. After two years delay, the two Polo, Nicolo and Maffei, taking with them Marco, the young son of the former, set out on their return along with a priest, who, however, soon left them, delivering the Pope's letters into their hands. Starting from Acre, on the coast of Syria, the Polo were three years and a half upon this journey. They moved by Mosul, Baghdad, Hormuz; they traversed Kerman, and Khorasan, Balkh and Badakshan, in which last country they seem to have been long detained by the illness of young Marco. From Badakshan, they ascended the Oxus to the lake of Sirikol and the plateau of Pamir. They crossed the steppe of Pamir, and de-

MARDA.

ascended into Kashgar, whence they proceeded by Yarkand and Khoten and across the great desert of Gobi to the Tangut province on the extreme N. W. of China, partly within, partly without, the wall. Here they were met by a deputation sent by the Kablai Khan, who was at the time residing at Shang-Tu, about fifty miles north of the wall. Their journey had occupied 3½ years. Upon their arrival at Pekin, which they call by the Tartar name Cambala, or Khan-balig, young Marco, then 21 years of age, was taken immediately into favour, he learned the language and for twenty-six years afterwards was a nobleman of the great Khan's Court, employed in several missions, and in other high offices of State. He came away at last, in A. D. 1295, in charge of a princess who was to be married to the Tartar sovereign of Persia. He was sent on a mission through Yuan to the frontiers of Ava, and successively to Kara Koram, to Champa or southern Cochin China and to the Indian Seas and afterwards by sea via Sumatra and India through Cambay to the Mongol tribe of Bayant, to select a lady for the Kablai's great nephew Arghun Khan of Persia which he did, handing over the lady in 1294. He returned to Venice A. D. 1295. Marco was subsequently taken prisoner at the battle of Curzola (near Lissa) on the 8th September 1298. On his return to his native country, he circulated his travels, in manuscript, amongst his friends: the narrative was, in 1298, transcribed by a Genoese named Rustiglo, four years after the death of Kublai Khan. They were first published in Latin in 1320. A copy had been presented by the government of Venice to the Infante Don Henrique in 1428, from which an edition was published at Lisbon in 1502. The earliest edition published in France bears date 1556. His book was entitled *Viaggi di Messer Marco Polo Gentiluomo Venetiano*. There are two translations of it into Latin. He treats in his book *De Regionibus Orientis*. Kablai Khan was the conqueror of southern China, which the Arabs call Machin and which Genghiz Khan, his grandfather, had charged his children to conquer, after he himself had gotten the Northern China called Katai.

Marco Polo sojourned in the hills of Badakshan for the sake of his health, and he describes the countries of Wakam, Pamir, Bolor and Kashmir.—*History of Genghiz Khan*, p. 443. *Prinsep's Tibet, Tartary, Mongolia*, p. 8. *Yule's Cathay*. See Japan, Kabul, Khoten, Jews, Johore.

MAREB.

tha in Karnatica. Trees of Malabar and Canara, probably three species of *Terminalia*, *T. alata*, *T. Berryi*, *T. chebula* or *T. glabra*, of large dimensions and perfectly straight with wood of a dark brown colour and very close grained, which might be converted with advantage into plank, thick-stuff, beams, &c. for ships, where strength is required, and where weight is of little consideration. It runs from sixty-two to seventy pounds the cubic foot, when green: the native carpenters use it with the teak for beams in the pagodas, &c.; it is considered durable; and contains a quantity of oil. An inferior description is named "Vellai Marda," or white Marda; it much resembles the former tree, excepting in size and in leaf, both of which are considerably smaller, and it is said by the natives to be inferior in quality and durability; it is more like the English oak in grain than any wood Mr. Edye met with. These trees, and also the former sort, are found in patches of some hundreds together, and generally on the banks of rivers, another sort, named "Vellai Katti Marda," or White Lump Marda, grows to about twelve or fifteen inches in diameter, and twenty-five feet long. In Malabar there is a fourth sort, named "Kalu Vithe Marda," the Dark Stone Marda, of the same quality as the last sort and used for the frames of vessels, and many other purposes, for which it answers well.—*Edye Forests of Malabar and Canara*.

MARE or Chirugu chettu HIND. TEL. *Caryota urens*, L.

MAREB, a dam, which formed a celebrated reservoir above the city of Saba in Yemen, between two hills of Balak. It was constructed or repaired by Balkees queen of Sheba, about the beginning of the christian era, but it burst about A. D. 120, deluged the country far and wide, and reduced it to a state of utter desolation. The Mareb lake

MAR ELIAS.

of ul Arem is mentioned in ch. 34 of the koran, as the Sail ul Arem, or rush of water from the reservoir, and its bursting is there attributed to a punishment sent from God, for the impiety, pride and insolence of the city of Saba. "The descendants of Saba had heretofore a sign in their dwellings, namely, two gardens, one on the right hand and one on the left: and it was said unto them, eat ye of the provision of your Lord; and give thanks unto him, ye have a good country and a gracious Lord. But they turned aside from what we had commanded them: wherefore we sent against them the inundation of El Arem, and we changed their two gardens for them into gardens producing bitter fruit, and tamarisks, and some little fruit of the lote tree." The expedient of constructing reservoirs in which to store rain-water has prevailed in Arabia from a very early date. These are generally found in localities devoid of springs, and dependent on the winter rains for a supply of water during the summer months. The most remarkable instance on record is this great dam of Mareb, which doubtless suggested similar reservoirs in other parts of Arabia, and the neighbouring coasts of Africa, which have usually been subject to it. All the travellers who have penetrated Yemen describe many such in the mountainous districts, and others exist in the islands of Snad-ed-din, near Zailah, in Kutto, in the Bay of Amphila, and in Dhahuk, near Massowah. See Saba.

MAREDU CHETTU or Bilvamu or Vilva, *Ægle marmelos*, Corr. is sacred to Mahadeva or Siva: he alone wears a chaplet of its flowers, and they are not offered in sacrifice to any other deity; if a pious saiva hindu should see any of its flowers fallen on the ground, he would remove them reverently to a temple of Mahadeva. See *Ægle marmelos*: Kali.

MAREGOLAN. A large island fronting the S. W. part of Gillolo.—*Horsburgh*.

MAR ELIAS, called by the mahomedans Deir el Munkoosh, the ornamented or painted monastery, the remains of a Nestorian monastery. Assemani does not give the date of its foundation, but it is mentioned incidentally in the ninth century. Mar Elias is mentioned by him thus: Joshua Bar-num of Bath Gabar, a village on the Tigris, between Nineveh and Mosul, lived thirty years in the monastery of St. Elias, before he was elected primate of the East, which happened A. D. 824. Abu Saed was Archimandrite of Mar Elias in A. D. 1028.—*Rich's Residence in Koordistan*, Vol. ii. p. 113.

MARGINANA, the second settlement of the Aryans was in Mouru, Merv or Marguana. This is Margiana (from the river Margus,) now Marghab (Margus-water,) Margush in the cuneiform inscriptions: a fruitful province of Khorassan surrounded by deserts. In the Record, (iii. verse 6,) it is described as "the third best land, the mighty and pious Mouru, (Marw,) . . . Ahri-man created there wars and marauding expeditions.—See Aryan, Bactria, Greeks of Asia.

MARGINELLA a genus of molluscs.

MARGOSA, the Portuguese name, Vembu the Malayan and Vupa the Tamil names, of the *Azadirachta indica* which grows from eighteen inches to three and a half feet in diameter. In appearance it is much like mahogany, and is used by the natives for general purposes.

Its bark,

Nim,	BENG.	Nimba,	SANS.
Bewa,	CAN.	Tel-kohumba,	SINGH.
Nim-tree-Bark,	ENG.	Vaypum puttay,	TAM.
Nim-ka chal,	HIND.	Vaypa putta,	TEL.

is bitter, is considered a valuable tonic, and has been tried by European physicians with a success nearly equivalent to what might have been expected from cinchona bark.

Its oil,

Nim ka Tel,	HIND.	Vepa nuna,	TEL.
Vaypum Yonnai,	TAM.		

is obtained from the seeds by either expression or boiling and is valuable and much used medicinally. The fruit is not unlike a small French olive in size and appearance. The oil is of a deep yellow colour, has a strong smell and an unpleasant bitter taste, is much esteemed by native doctors

MARI-AMMUN.

is a warm medicine, as an external application in foul ulcers, and as a liniment in rheumatic and spasmodic affections, &c. In the year 1847-48, 1,587 gallons were exported, and in the year 1861-62, galls. 1,917, in 1862-63, galls. 3-111, but the demand is not constant. It is frequently burnt in lamps, and is sold in the bazar, under the name of "bitter oil" also black oil. Dr. Maxwell, found this oil equally efficacious to cod-liver oil in cases of consumption and scrofula. He began with half-ounce doses, morning and evening, which were gradually reduced.

The leaves of the genera *Melia* and *Azadirachta*, dried and kept in books, are much used by the people of India to preserve furs, feathers, books, papers and clothes that are lodged in trunks, book cases, &c. from the attacks of insects. It is useful to place along with them small packets of camphor; or little cups of camphor dissolved in alcohol.—*M. F. J. R. Simmonds' Comm. Products*, p. 537. *Edye, Ceylon-Faulkner*.

MAR GRIGORIUS son of hakim Harun ul Malati, is the Abul Phangius of historians, and is known to the Arabs as Abul Faragh. He was a Christian by religion. He wrote the Book of Dynasties, in Arabic, in the reign of Arghun Khan, the last of Chenghis Khan's grandsons. He was a Jacobite christian of the city of Malatia in Cappadocia. His book was arranged in ten chapters. (1) On the Saints since Adam. (2) The Judges of Israel. (3) The Kings of Israel. (4) The Chaldean Kings. (5) The Kings called the Magi. (6) The Ancient Greek Kings. (7) Latin Roman Kings. (8) Christian Greek Emperors. (9) Mahomedan Arabic Kings. (10) The Mogul Kings.

MARKARUNG KAI, TAM. *Gardenia dumetorum*.

MAR-KHOR. HIND.

Rawacheh, of Little Tibet. Race of the Oxus. Tsuru or water goat, "

Capra megaceros of Hutton, the wild goat of Hazara and the N. W. Himalaya, &c. is called markhor because fabled by the mountaineers, to kill snakes by looking at them; and in Yaghistan and Chilas they say that when its foam falls on certain stones it turns them to zahr-mohra. The Ibex and Markhor often dispute each others' footing; and Dr. Adams is not aware that they are ever met with on the same ranges. It is found on the mountains of Persia, Afghanistan, and is plentiful on the ranges around the Khyber Pass. From Torbela and Little Tibet it wanders down the Suliman range

MARKING NUT.

as far as Mitenkote on the Indus, at the junction of the latter and the Sutlej. It is common on the north-western ranges of Cashmere, including Dardu; from thence a few herds are to be met with all along the southern or Futi Pinjal as far as Kishtowar on the Chonab. The northern ranges of Cashmere and Ladakh are apparently without a single individual, perhaps on account of the ibex and wild sheep frequenting these mountains. Mr. Blyth and Dr. J. E. Gray consider this species as most likely a variety of the domestic goat, but from all Dr. Adams could learn of its habits and appearance, there is perhaps more cause to consider it the progenitor of the domestic animal than even the ibex. The markhor is usually found in small herds. Like the ibex, it delights to browse on steep and rocky mountains, ascending and descending with the seasons. In winter, in common with other alpine species, the fur becomes dense from the woolly pileage, which gives a lighter colour to the coat than during midsummer and autumn, when it disappears, and the fur is short and brown. Hunters have strange stories of the serpent eating disposition of the markhor: Ajez Khan assured Dr. Adams that an ammonite he picked up on the mountains had become petrified from having passed through the intestines of a markhor.—*Adams. Jerdon*.

MARMALADE WATER. A fragrant perfume distilled in Ceylon from the flowers of the *Ægle marmelos*, and used in the ceremonial sprinkling of visitors.

MARMALADE. A confection generally made of the rind of oranges, citrons &c., cut into very thin slices, and boiled with sugar.

MARMER. *Dut.* Marmo. *It.* Marmol. *Sp.* Marmor. *Gér.* Lat. *Rus.* Marble.

MARMOT, a genus of the Mammalia of the sub-family *Arctomyiinae* of which one species occurs in Europe and two species in the region around the Paropamisus.

Arctomys himachalanus; the red Marmot, Samming, *Lepch* | Chipti, *Bhot.*
Dran, *Tibet.* | Pheen, *PUNIA.*
occurs at 8,000 to 10,000 feet in Kashmir and the N. W. Himalaya. The total length of an adult dran is from 2½ to 3 feet; the colour, chestnut, with black splashes on the back and hip. It is seldom met with under 8,000 ft. above the level of the sea.

Arctomys bobac Schreber, is the Tibet Marmot or white Marmot. Dr. Adams when crossing the Tang Lang Pass came on a colony of white marmot, distinguished at once from the red species by its lighter colour, being a yellowish white but also by its call which more resembles a whistle than a scream. One side of a spur was riddled by their burrows. The white seems to take the place of the red marmot on the more barren and higher ranges, above 10,000 and 12,000 feet. The bearded vulture and larger eagles are among their chief enemies. He has seen the former bear off a marmot with great ease. The marmots are generally supposed to be the animals alluded to by Herodotus, as gigantic ants, which dug up gold.—*Jerdon's Mammals*, pp. 181-182. *Adam's Naturalist in India. Mrs. Hervey's adventures of a Lady in Tartary*, Vol. I., p. 197.

MARMUT, A lichen abundant in the crevices of the rocks of Baluchistan used medicinally by hindooes, in diseases, of languor and oppression of the *vis vitæ*. The plant, replete with juice, and extremely

MAROS.

bitter and nauseous, is dried, and a quantity of the powder swallowed, after which water is directed to be drunk. The same, or an analogous plant, abounds in the Khyber hills, and is carried to Peshawar, where it is largely used as an article of food by Hindus.—*Mason's Journeys* V. II p. 116.

MARNI, HIND. *Sponia Wightii.*

MARO, See Mahomed.

MARONITES, a Christian tribe of Lebanon, founded in the 6th Century by a St. Maronius. They acknowledge the supremacy of Rome. They occupy the most central valleys and highest ridges from Tripoli to the south of Beyrout. See Lebanon.

MAROO, a class of the Charan. See Bard, Bhat, Charan.

MAROO, HIND. Two antelope horns joined in opposite directions at their bases, carried by faqueers.

MAROO, or Marnsthan, names of Rajputanah. Col. Tod relates that in the year 1743, the Champawut, Koompawut, Oodawut, Mairten, Joda, Kurumsot, and all the assembled clans of Maroo, became impatient to see their sovereign. They sent for the Kheechie Mokund, and prayed that they might but behold him and he came. In triumph they conveyed the young raja to Ahwa, whose chief made the badhoo with pearls and presented him with horses.—*Tod's Rajasthan*, Vol. II, p. 72. See Marost'hali, Marwar.

MARRAN. HIND. *Ulmus campestris*.

MARRAVUTTAY MARAM. TAM. *Hydnocarpus inebrians*.

MARRE. TEL. *Caryota urens*. Linn.

MARRI. A district west of Kashmir through which the Jhelum runs.

MARRI. A sanitorium town in L. 33° 51' 0; N. L. 73° 22' 7 E. and 33 miles N. of Rawalpindi. The southern side of the station of Marri is 6,963 feet above the sea. Rawalpindi to the west of the Jhelum is 1737 feet above the sea. The range of hills on the right bank of the Jhelum, overhang the platform of Rawalpindi. It is a narrow ridge separating two deep river valleys, whose vegetation is quite tropical.—*H. f. et T.* 213. *Schl. Herm. and Ad.* See Abbottabad.

MARRI. A race or tribe occupying part of Baluchistan. Kahan town, in Kach-Gandava, is in the hill ranges east of the plain of Kach. It belongs to the Doda Marri, a division of the great and widely dispersed Marri tribe who have been located in the neighbourhood for several centuries. The Marri are a brave race and have long been distinguished as daring depredators.—*Masson's Journeys*. See India, Kadjak, Kahan, Kolat.

MARRI AI, literally the Death-Mother, the goddess worshipped by the Beldar race of Berar.

MARRIAGE CUSTOMS. In the East Indies, amongst its various races, forms for the union of men and women are to be seen from the simplest modes of mutual consent, through all the various known procedures of marriage by capture, community of right, polygamy, polyandry, temporary marriages, permanent lifelong marriages, endogamous marriage within the tribe or race, exogamous marriage out of the tribe or race, and there are men and women who never marry and men and women who marry only once.

Mr. McLennan and Sir John Lubbock have examined, at length, the subject of primitive marriage and various writers on the tribes and races in the south and east of Asia have furnished notices of the prevailing marriage customs. The popular theory is that marriage sprang from the family, which developed into the clan, and thence into the nation, but Mr. McLennan argues that this hypothesis though possessing the merit of simplicity, is not supported by evidence. The evidence, he contends, collected everywhere of primitive man, and confirmed by all observation among the savage races still existing in the world, always leads back further than the family—to groups, as in the Andamans,

MARRIAGE CUSTOMS.

of naked, squalid savages living by the capture of wild beasts or upon the more easily-caught shell fish. These groups, he contends, for many reasons, only very slowly developed the idea of kinship, the primary one being that as they held their women in common they were never certain of relationship except through the mother's side and this practice of counting from the mother still exists amongst the Nair race in Malabar. In the awful struggle which primitive man must have maintained for existence, it was natural that tribes badly situated as respects food should consider female infants a nuisance, and kill them out, as very many tribes do now. Wanting wives, they would then be tempted to capture them from other tribes who either from a better supply of food or a slight advance in civilization, possessed more women, and they could only capture them in battle. Women came, therefore, to be regarded as booty, and like other booty were held in common, as the possession, first of all, of the tribe which captured them, and afterwards, as tribes grew larger, of those actually engaged in the capture. This is the explanation of the otherwise unintelligible fact that the marriage ceremonies of almost all uncivilized or semi-civilized races represent capture, the form having endured as an etiquette long after the practice had passed away. This, too, is the root of that strangest of all practices, strangest because apparently opposed to the fiercest passions of man, his egotism and jealousy—polyandry. It is not perhaps opposed to his inherent instincts, though some thinkers have contended so, for there are still tribes, such as the Nicolai race who have absolutely no sexual laws, any more than the animals, and, even in civilized Europe, polyandry, under the guise of "the sin of great cities" exists to an enormous extent. The theory of kinship would, under such circumstances, be very slow of development, and would attach only to relationship by the mother's side, and Mr. McLennan shows by a mass of evidence that this was the earliest idea of man, most nations having a tradition of some one reformer who abolished it, while it flourishes still in a form more or less limited over an amazing extent of the earth's surface.

Polyandry now prevails universally in Tibet, is common in the Himalayan and Sub-Himalayan regions adjoining Tibet; in the valley of Kashmir, in Spiti, in Ladak, in Kistwar, in Sirmor, in the Sivalik range, in Kasia; there are unmistakable traces of its existence, till recently, in Gurwhal, Sylhet, and Cachar, and we find it still prevalent among

MARRIAGE CUSTOMS.

the Toda of the Neilgherry Hills, the Coorg of Mysore, and the Nair, the Malere and Polere of Malabar, in Ceylon amongst the Kandyan race, and further east, as an ancient though now almost superseded custom, in New Zealand, in one or two of the Pacific Islands, and in the Aleutian Islands; and to the west and north of the Aleutian, among the Korvak to the north of the Okhotsk Sea. Crossing the Russian empire to the west side we find polyandry among the Saporogian Cossack. Polyandry is also found in several parts of Africa and according to Humboldt it is prevalent in America among the tribes on the Orinoco, and he vouches for its former prevalence in Lancerota, "one of the Canary Islands.

The first step of progress seems to have been from promiscuity to polyandry, thence to polyandry such as Cæsar found in Britain and as exists in Tibet and Coorg and Kandy, limited to brothers, thence to the restricted form known to the Jews and early Hindoos noticed in Ruth and Mann, in which only the childless widow fell to the brother, and finally to the system of regular marriage between pairs, ending usually, as in India, in excessively strict rules of kinship. Mr. M'Leunan's proposition is that the pairing off of mankind which we call marriage, so far from having been the original form of society, was an enormous step in civilization, only reached after ages of progress, and after the strife for subsistence had, by the discovery of agriculture, been rendered less bitter, so easy indeed as to allow the less fortunate tribes to keep their female children alive. This argument is opposed to almost all previous theories, but it is put forward by him supported by an extraordinary array of facts, and deserves the attention due to any speculation obviously begun for the sake of historical truth. The object of the inquiry is of course not merely to ascertain the steps in the history of marriage but the much greater point whether man, as his early history recedes under investigation, draws nearer to or recedes farther from the brute. Mr. M'Leunan obviously thinks that he draws nearer to it; that there was, in fact, a time when man had only instincts and the real capacity which separates him finally from the animal, the power of advancing endlessly towards higher things. We can, he says, trace the line of human progress far back towards brutishness; finding as we go back the noble faculties peculiar to man weaker and weaker in their manifestations, producing less and less effect—at last scarcely any effect at all—upon his position and habits. As we go back, we find more and more in men the

MARRIAGE CUSTOMS.

traits of gregarious animals, slighter and slighter indication of operative intellect. As among other gregarious animals, the unions of the sexes were probably in the earliest times loose, transitory, and in some degree promiscuous.

It is not possible to learn from the history of India, all the marriage customs prevailing in it. Its races, from the most ancient times until now, have kept themselves distinct from each other and the evidence of the Mahabharata, of the Ramayana, the Institutes of Mann, the Purana and the Veda, can only be accepted as relating to portions of the inhabitants. When we read that in the famous Indian city of Vesali 'marriage was forbidden, and high rank attached to the lady who held office as chief of the courtesans. Such must be regarded as an exceptional or local condition of which, even yet, in British India, there is an instance in the town of ——— in North Canara. It is stated that when Sakyamuni in his old age, visited Vesali, he was lodged in a garden belonging to the chief of the courtesans, who drove out to visit him, attended by her suite in stately carriages. Having approached and bowed down, she took her seat on one side of him and listened to a discourse on Dharma. . .

. . . On re-entering the town she met the rulers of Vesali, gorgeously apparelled, but their equipages made way for her. They asked her to resign to them the honour of entertaining Sakya-muni, but she refused, and the great man himself when solicited by the rulers in person, also refused to break his engagements with the lady.' This custom, of the temple dancing girls advancing to meet a great man, is still prevalent, and they show this honour alike to a Governor or a Bishop. Until recently, the Deva-Dasa, or slaves of the idols, were the only educated women in India. All the great hindoo temples have bands of the Deva-Dasa attached to them who 'follow their trade without public shame, and a woman born of, or adopted by one of the temple slave women is not held to pursue a shameless vocation, though other women who have fallen from good repute are esteemed disgraceful. The explanation of this, however, is that in British India, every person, according to the Institutes of Mann, is pure in his or her own vocation, and the Deva-Dasa continue the old custom of the country, under solemn religious sanction; the latter, on the contrary, have given way to lawless inclinations, have outraged public feelings, have probably broken their marriage vows, and brought disgrace on their families. At the present day, the hindoo weaver races near

MARRIAGE CUSTOMS.

Chinglepat, 35 miles from Madras, devote the eldest daughter to the temple and all classes of hindoos in time of trouble or in hope of offspring, vow their girls to the temples. In Ancient Egypt, again, it would appear that illegitimate children were, under certain circumstances, preferred over those born in wedlock.

Sir John Lubbock further points out that in many cases the exclusive common possession of a wife could only be legally acquired by a temporary recognition of the pre-existing communal rights. Thus in Babylonia, according to Herodotus, (Clio, 199.) every woman was compelled to offer herself once in the temple of Venus, and only after doing so was she considered free to marry; the same, according to Strabo, was the law in Armenia. (Strabo, lib. 2.) In some parts of Cyprus, also, among the Nasamones (Melpomene, 172) and other Ethiopian tribes, he tells us there was a very similar custom, and Dulauro asserts, that it existed also at Carthage, and in several parts of Greece. The account which Herodotus gives of the Lydians, though not so clear, seems to indicate a similar law. The Reverend Joseph Roberts relates (p. ix.) that in Madras, Balaso and other places, beautiful virgins used to go to the temple once in their lives to offer themselves in honour of the goddess, the story being that a god had converse with them. That the special marriage was an infringement of these communal rights, for which some compensation was due, seems to Sir J. Lubbock the true explanation of the offerings which virgins were so generally compelled to make before being permitted to marry. Among the Sonthal, one of the aboriginal Indian tribes, the marriages take place once a year, mostly in January. For six days, all the candidates for matrimony live together in promiscuous concubinage; after which only are the separate couples regarded as having established their right to marry. Such communism is to be traced in the rite of Bundling an old Dutch, Orkney, Shetland and Hebrides usage, as in Wales. In Scotland, the plan was called Hand-fasting. In Sparta, the youth courted under the veil of night, the lover being supposed not to see the face of his mistress until they were acknowledged man and wife.

The primeval custom of capture of wives, continues to have symbolic representations. The old Norse for marriage is *quan-fang* or wife catching; the German is *Brut loufti* or Bride racing. The Bedouin unmistakably follow the rite of marriage by capture and yet the man can claim to marry his cousin,

MARRIAGE CUSTOMS.

if only he be willing to give the price demanded for her, and, amongst the mahomedans of Arab origin, in the peninsula of India, to wed the maternal uncle's daughter is a recognized right.

In Circassin, weddings are accompanied by a feast, in the midst of which the bridegroom has to rush in, and, with the help of a few daring young men, carry off the lady by force, and by this process she becomes his lawful wife. According to Spencer, another important part of the ceremony consists in the bridegroom drawing his dagger and cutting open the bride's corset.

Among the Kaluuk, Dr. Hell tells us that, after the price of the girl has been duly agreed on, when the bridegroom comes with his friends to carry off his bride, a sham resistance is always made by the people of her camp, in spite of which she fails not to be borne away on a richly caparisoned horse, with loud shouts and *feu de joie*.

Major Dalton mentions that among the Kol of Central India, when the price of a girl has been arranged 'the bridegroom and a large party of his friends of both sexes enter with much singing and dancing, and sham fighting in the village of the bride, where they meet the bride's party, and are hospitably entertained.

Occasionally, a few of the young man's friends assemble outside the fields where the women are at work, and rush on them to capture the girl he has fixed on, carrying her off from amongst the labourers, though a defeat and rescue are not uncommon.

Amongst some of the Mongol tribes, the girl mounts on horseback and flees pursued by the lover who only detains her as a wife if he overtake her. The girl is first mounted, and rides off at full speed. Her lover pursues; if he overtake her, she becomes his wife, and the marriage is consummated on the spot; after this she returns with him to his tent. But it sometimes happens that the woman does not wish to marry the person by whom she is pursued; in which case, she will not suffer him to overtake her. And Dr. Clarke was assured that no instance occurs of a Kaluuk girl being thus caught, unless she have a partiality to the pursued. Among the Tungus and Kamchikdale, says Ernan, a matrimonial engagement is not definitively arranged and concluded until the suitor has got the better of his beloved by force, and has torn her clothes. Attacks on women are not allowed to be avenged by blood, unless they take place within the court or house. The man is not regarded as to blame, if the

MARRIAGE CUSTOMS.

woman have ventured to leave her natural place, the sacred and protecting hearth.' Pallas observes that in his time, marriage by capture prevailed also among the Samoyeds.

The Jakun races of Malacca are badly dressed, many of the women have only a sarong, and if they are married, a ring, the necessary present of the husband before marriage. The greater part of the men have nothing but a strip of the fibrous bark of the terap tree, beaten into a sort of cloth of a reddish brown colour, called a sabaring, round their loins; part of this comes down in front, is drawn between the legs and fastened behind. Their marriages are ordinarily celebrated about the month of July and August when fruits are plentiful. The bridegroom frequents for some time the house of his intended and when he has obtained her consent, he makes a formal demand to the father. A day is then appointed and an entertainment is prepared, more or less solemn, according to the means of the two contracting parties, and their rank in the tribe. When the day of the marriage is arrived, the bridegroom repairs to the house of the bride's father, where the whole tribe is assembled. The dowry given by the man to his intended is delivered, and must consist at least of a silver or copper ring, a fewubits of cloth: perhaps a pair of bracelets, or other ornaments, and furniture are added. Sometimes the woman presents also some gifts to her intended and then the bride is delivered by her father to the bridegroom. Amongst some tribes there is a dance, in the midst of which the bride elect darts off into the forest followed by the bridegroom, a chase ensues during which, should the youth fall down, or return unsuccessful, he is met with the jeers and merriments of the whole party, and the match is declared off. A European who inhabited Pahang many years, said that during the banquet a large fire is kindled, all the congregation standing as witnesses: the bride runs round the fire till caught up by the groom. Amongst these Jakun races adultery is punishable by death. It is not allowed to keep more than one wife. Only one was seen who had two, and he was censured and despised by the whole tribe. A man can divorce his wife and take another. If the divorce is proposed by the husband, he loses the dowry he has given to the woman; if the woman ask the divorce, she must return the dowry she received. The children follow the father or the mother according to their wishes, if young they follow the mother. In their marriages, the youth

MARRIAGE CUSTOMS.

arranges with the girl's parents, but the ceremonial reminds us of the old tale of Hippomenes and Atalanta. If the tribe is on the bank of a lake or stream, the damsel is given a canoe and a double bladed paddle and allowed a start of some distance, the suitor, similarly equipped, starts off in chase. If he succeed in overtaking her, she becomes his wife, if not the marriage is broken off. But the chase is generally a short one, for though the maiden's arms are strong, her heart is soft and her nature warm and she becomes a willing captive. If the marriage take place where no stream is near, a round circle of a certain size is formed. The damsel is stripped of all but a waist band, given half the circle's start in advance, and if she succeed in running three times round before the suitor come up with her, she is entitled to remain a virgin: if not, she must consent to the bonds of matrimony; as in the other case, but few outstrip their lovers.

According to Mohan Lal, the Sikh Jats are polyandrous, and one brother takes his brother's wife but in saying this he seems to allude to the custom of Carao, also written karao, seemingly from "karana," to cause to do, the term given among the Jat, Goojar, Ahir, and other races and tribes in western Hindustan to concubinage generally, but more especially to marriages of widows with the brother of a deceased husband. The practice which is also known to the eastward by the name of Oorhuree, in the Deccan as But'hee; and, in other provinces, by the name of Dhureecha, is followed among these classes, but is not very openly confessed even among them, as some degree of discredit is supposed to attach to it. It is only younger brothers who form these connections, elder brothers being prohibited from marrying their younger brothers' widows, but among the Jat of Delhi even this is not prohibited. The practice has been common among several nations of the East. The Jews followed this custom, and in Egypt it was admitted for a childless widow to cohabit with a brother of the deceased husband. When the laws of Menu were enacted, Carao appears to have been a recognized institution but as is not unusual with the Institutes, there is much contradiction between the enactments relating to it. From a consideration of all the passages on the subject, it appears that failure of issue was the point on which the legality turned. He who was begotten according to law on the wife of a man deceased, or impotent, or disordered, after the due authority given to her, is called the lawful son of the wife (Ch. IX, v. 176.)

MARRIAGE CUSTOMS.

From the fact of Draupadi marrying the five Pandoo-brothers, we learn that polyandry must have prevailed amongst the heroes of that period; and if polyandry, the practice of Curao was, no doubt, not uncommon: indeed, the compiler of the Mahabharata, Vyasa, was himself appointed to raise up offspring to his deceased brother. There is perhaps no circumstance which so strongly shows the northern descent of the deified heroes, as this marriage. Herodotus tells us that the practice prevailed among the nomadic Scythians, as it does at present among the Bhotia. The practice is adopted also by the Nair of Malabar, between whom and the people of the Himalaya Wilson traces the obscure vestiges of a connection.

Amongst the Jat, Goojar, and Ahir, children born Curao are considered legitimate, and are entitled to inheritance accordingly. Children begotten by the woman previous to Curao, except in the case of fraternal Curao, are known by the name of Kudhulra, and do not inherit the property of the father-in-law.

Japanese, of all classes, look upon their wives as upon a faithful servant; a Japanese is never known to beat his wife. It is a custom amongst some Japanese to take a woman a few weeks on trial before deciding upon whether to marry her or not. The Japanese marriage ceremony is very simple. The bride and bridegroom drink wine with each other three times, exchanging cups with each other every time, in the presence of a few select friends; after which the young lady gets her teeth blackened, and she is married for better and for worse.

Amongst the mahomedan women of India, also, the custom is followed of blackening the brides teeth with missee on marriage, women never use it before their wedding day, and it is by the black mark in the crevices between the teeth, occasioned by the application of the missee, that a woman can be observed to be married or not.

Among the Aheta of the Philippine Islands, when a man wishes to marry a girl, her parents send her before sunrise into the woods. She has an hour's start, after which the lover goes to seek her. If he find her and bring her back before sunset, the marriage is acknowledged; if not, he must abandon all claim to her.

The custom of capture is also to be traced in the rite of lifting the bride over the doorstep, which has prevailed in such different and distant races as the Romans, Redskins of Canada, the Chinese and the Abyssinians. Hence, also, perhaps the honey moon of England, during which the bridegroom keeps his

MARRIAGE CUSTOMS.

bride away from her relatives and friends; hence even, perhaps, as Mr. M'Lennan supposes, the slipper is in mock anger thrown after the departing bride and bridegroom.

The Bible shows a progressive change in the Jewish views on women. At the outset, the right of woman to choose her lot seems to have been wholly disregarded, as Abraham twice permitted Pharaoh to have Sara, Judah condemned his daughter-in-law to be burned* and God threatened to give David's wives to his neighbours or to his son. Michal was transferred to Phalti from David by Saul, who had quarrelled with David, and kings habitually succeeded to their predecessors' wives.

Among the Hebrew people so far back as the time of Abraham, monogamy was recognized as the only legitimate state of things. The elevated conception of marriage presented in the record of the creation, testifies to a most profound sense of the sacredness of monogamy as the most intimate possible union of two persons. The canticle is a song of wedded love and fidelity. Polygamy was not prohibited amongst the Hebrews, but there is nothing to warrant the terrible seraglio customs depicted in Judges and instituted by David and Solomon as regal.

In later Jewish history, the idea came to be that it was better for a woman to be a transferable concubine than to die an old maid, and virginity and childlessness were the only lots bewailed under the Old Testament regime. A writer in the Westminster Review observes that wherever the regime has been theocratic, as in the Jewish and Papal theocracies, there woman has fared the worst: and her position has been most favourable wherever a strong rough moral sense of individual right as in pagan Greece and Rome has been dominant. In pagan Rome, seclusion was not known, but on its change to christianity this became prevalent, divorce became impracticable, and while woman, theologically, was pronounced to be Queen of Heaven and Mother of God, she became a mere chattel of her husband.

Some of the Indian races are not permitted to marry amongst the same lineage while other races marry their near blood relatives. The Kocch are forbidden to marry excepting within the tribe.

Among the Yerkala of Southern India, the first two daughters of a family may be claimed by the maternal uncle as wives for his sons. The value of a wife is fixed at twenty pagodas. The maternal uncle's right, to the first two daughters is valued at eight, out of twenty pagodas, and is carried out thus:—if he urge his preferential claim, and

MARRIAGE CUSTOMS.

marry his own sons to his nieces, he pays for each only twelve pagodas; and similarly, if he, from not having sons or any other cause, forego his claim he receives eight pagodas of the twenty paid to the girls' parents by anybody else who may marry them.

The Doingsnak, a branch of the Chukma, appear to have been endogamous. Captain Lewin mentions that during the chiefship of Jaunbux Khan about 1782, the chief passed an order that the Doingsnak should intermarry with the tribe in general. This was contrary to ancient custom, and caused discontent and eventually a break in the tribe.

The Kalang of Java, who have some claim to be regarded the aborigines of the island, are also endogamous, and when a man asks a girl in marriage he must prove descent from their peculiar stock.

The Mantohu Tartar race forbid marriages between those whose family names are different. In Guam brothers and sisters used to intermarry, and it is even stated that such unions were preferred as being most natural and proper. Endogamy would seem to have prevailed in the Sandwich Islands and in New Zealand, where, as Yate mentions, 'great opposition is made to any one taking, except for some political purpose, a wife from another tribe; so that such intermarriages seldom occur.'

Amongst the brahmins, and rajputs of British India, throughout Western and Eastern Africa, in Circassia, Hindostan, Tartary, Siberia, China, and Australia, as well as in north and south America, marriages take place between persons of different tribes. Burton says that 'some clans of the Somali will not marry one of the same, or even of a consanguineous family; and the Bakalari have the same rule. In India, the Warali tribes are divided into sections and no man may marry a woman belonging to his own section. In the Magar tribes the same rule prevails. Col. Dalton tells us that the Ho, Moondah, and Oraon are divided into clans or keeli, and may not take to wife a girl of the same keeli.' The Garrow are divided into mahari, and a man may not marry a girl of his own 'mahari.' Mr. McCulloch relates that the Manipar and other tribes inhabiting the hills round Manipur, the Koupooi, Mow, Muram, and Muring, are divided into families, Koomrul, Looang, Aru, and Ningthajias &c. A member of any of these families may marry a member of any other, but the intermarriage of members of the same family is strictly prohibited.' The Toda race, according to Metz, 'are divided into five distinct classes, the known

MARRIAGE CUSTOMS.

by the names Peiky, Pekkan, Kuttan, Kenae, and Tody; of which the first is regarded as the most aristocratic. These classes do not even intermarry with each other, and can therefore never lose their distinctive characteristics. General Campbell and Major Macpherson mention that the Khond regard it as degrading to bestow their daughters in marriage on men of their own tribe; consider it more manly to seek their wives in a distant country, and regard marriage between people of the same tribe as wicked, and punishable with death. The Kalmuk, according to Dr. Hell are divided into hordes, and no man can marry a woman of the same horde; the bride, says Bergman, is always chosen from another stock; 'among the Dabet, for instance from the Torgot stock, and among the Torgot from the Dabet stock. The same custom prevails among the Circassian and the Samoyed. The Ostiak regard it as a crime to marry a woman of the same family or even of the same name.

Polygamy has prevailed in Asia generally from the most ancient times, but as a rule it has been practised only amongst the rich and luxurious, or by those whose first wives gave no children, or amongst tribes whose traditions and customs compelled them to raise up seed to their deceased brethren. The Veda, however, recognises monogamic marriages, the union of one man and one woman, as the natural state; husband and wives are described in the Rig Veda (Mand. I, Hymn 131, V. 3; also Hymn 43) as presenting their oblations two and two together and at another place (Mand. II, Hymn 39) a husband and a wife are given amongst other illustrations of pairs. On the other hand, (Mand. I, Hymn 126,) a young Rishi, named Kukshivat, celebrates the generosity of a rajah who had given him his ten daughters in marriage. In ancient times, amongst the mountain tribes, on the western parts of the Himalaya known as Gandharva, and supposed to be the modern Kandahar, the practice was at one time prevalent amongst the kshatrya tribes, of forming a union by mutual consent, and associating together without any preliminary ceremonies. The brahminical legislator Manu (Ch. III v. 26-32-41) recognises the legality of such marriages, but declares none but the kshatrya race may contract them, he denounces them as base unions, the offspring of which will act cruelly, speak untruthfully and abhor the Vedas. Such unions,—in the present day, are not known to occur. When the two younger sons of king Santanu Vichitru Virya died childless, the Maha Bharata mentions that Vichitru Virya's widow first asked

MARRIAGE CUSTOMS.

Bhisma saying, "take the rajah's widows, I pray you, and raise up sons that shall be to him as his own sons," and being refused, in consequence of his vow, how can I do this thing? have I not vowed a vow that I would never become the father of children by any woman," she sent for her own kinsman, Vyasa, to whom was born the blind Dhritarashtra, Pandu and Vidura. This practice is identical with that of the Jews, as described in Ruth.

In most countries, man has arrogated to himself a superiority over woman and has regarded her duty to be to submit to man's decisions. But the ancient Britons, as also some of the Median Cantons, the Pict, and the Geta were polyandrous and the custom is traceable among the ancient Germans. In the present day polyandrous rites prevail in Thibet, in Cashmir, in the Himalaya, amongst the Toda, the Coorg, the Nair, the Kandyan race, in Ceylon, also in New Zealand and some of the Polynesian islands, in the Alentian Archipelago, among the Koryak, the Saporigian Kasak, on the Orinoko, amongst the Iroquois in parts of Africa, and in Lancaster.

The origin of the polyandric custom has been referred to the communist practice still in force amongst hindus, with respect to all property and earnings, for where small parcels of land were to be subdivided amongst families, it was of consequence that the members should continue limited. The scarcity of women amongst a military class of foreign immigrants and the absence of brothers on pasturing expeditions whilst others stayed at home have also been pointed to.

The Mahabharata, relates that Pandu with money and jewels, purchased Madri from her brother Salya, king of Madra. But in former times the princesses of some parts of India appear to have enjoyed the privilege of selecting a husband from amongst a number of suitors assembled for the purpose at a swayambara or tournament. In the Institutes of Mann (Book III ver. 27) eight different forms of marriage are mentioned, but this right of selection is not one of them. In the 9th book, ver. 9, there is an allusion to it, but it is doubtful whether this has reference to any but the commercial and servile classes. "Three years let a damsel wait though she be marriageable. After that time let her choose for herself a bridegroom of equal rank." In Kalidasa's celebrated poem, called Raghuvansa, there is a beautiful description of the Swayamvara of Indumati, sister of the king of Vidarbha, in which she chooses Aja, the son of Raghu, out of a large as-

MARRIAGE CUSTOMS.

semblage of royal suitors. In professor Johnson's Selections from the Mahabharata we have an account of the Swayamvara of Drupadi, the daughter of Drupada king of Panchala, and afterwards the common wife of the five Pandu princes.

In South Malabar, descent to sons is the law, but in North Malabar, the Nair, the carpenter, brass-smith, black-smith, and gold-smith artizans, the Tiyar, who are toddy drawers, and the Mookwa who are fishermen, are all polyandrists and descent of property goes in the female line. In North Malabar this law of descent is called Maruma ka-tayam, and the mahomedan Mopla has conformed to this usage. In Canara, a similar law called Alya-Santana, or nephew inheritance, prevails and is in practice more strictly carried out than in North Malabar. In North Malabar the adherents to Maruma-ka-tayam form united family communities termed Tarwad. The senior member of whatsoever branch is the head of the family and is termed Karnaven; the other members are styled Anandraven. The remotest member is acknowledged as one of the family and entitled to maintenance if living under subordination to the head of the family and taking part in their religious observances; for the women there is nothing analogous to the state of widow-hood as existing elsewhere, whether in alliance with men or not, they reside in their own families. The Nair marries before he is ten years of age, but though he supports, he never associates with his wife who receives, at her pleasure, any men, provided they be not of lower birth. Consequent on this form of descent, a Nair does not know who his father is. In law, property is held to vest in the females only: practically the males are co-sharers with the females. In default of males, females succeed to the management of the family property. In some families, the management devolves on them preferably to the males and the senior female takes it. There is, however, a growing tendency to convey property from father to son, arising from the gradual abandonment of polyandristism. The connubial connection in question is called in Malabar "goona-dosham,"—"goona" good "dosham," evil (for better for worse). In Travancore, it is styled "mundu-vanga," viz: mundu cloth "vanga" receiving, where the girl taken is of ripe age and her consent must be obtained. Personal acquaintance thus precedes the union. The hour selected is 8 p. m.; there is an assemblage of friends; the man presents the woman with a "mundu" or white muslin cloth, in a corner of which in North Mala-

MARRIAGE CUSTOMS.

bar, a small sum of money is tied. The girl either goes to the man's house, or remains in her own and is visited by him there. Each party is unrestricted as to the number of such connections that may be formed, but these ordinarily do not exceed two or three. The descent being in the female line, the parentage of the father is immaterial. The maruma-ka-tayam law is not followed in North Malabar by the Aka-Podval, a class of pagoda servants, nor by the brahmins of North Malabar or of Canara, but in Travancore law only the eldest brother of a brahmin's family is allowed to marry with his equal the other brothers form other connexions. In the Tuluva country, the brahmin widow can devote herself to the temple, and reside outside or inside its walls. If within the walls, she is a servant of the idol and receives the visits of men of her own caste only: the offspring of such if boys are called Moylar, and the girls are married to them. But if she elect to reside outside the wall she must pay a monthly sum to the pagoda and may cohabit with any man of pure descent.

Amongst the Siah posh Kafir, the marriage ceremonies are extremely simple, consisting merely of procuring two twigs, or rods, of the respective height of the bride and bridegroom, and tying them together. They are then presented to the couple, who preserve them with much care, so long as they find it agreeable or convenient to live together. If desirous to separate, the twigs are broken and the marriage is dissolved.

With the buddhist races of Tibet, and Burmah, marriage is more readily contracted, and the tie more easily broken. In Burmah marriage and concubinage are regarded as civil contracts, and all breaches are punished by fines, seduction is also punishable by a fine. Girl marriages, as in India, are unknown in Burmah, and a Burmese girl is courted and won. The period of the day between eight in the evening and midnight, is called courting time during which the girls receive five or six admirers, who act as a check to each other. The women wear as a petticoat a gay coloured cloth, which just wraps the lower part of the body, and opens at every step, and this costume was adopted to attract the men.

According to Grosse, (*Histoire Abregee des Cultes*, Vol. I, p. 431), and particularly in the valleys of the Ganges, virgins were at one time compelled before marriage to present themselves in the temples dedicated to Juggernaut, and the same is said to have been customary in Pondicherry and Goa. There is no similar custom known at present,

MARRIAGE CUSTOMS.

in any part of India, the most recent notice of it being that at p. 168; related by the Revd. Mr. Roberts.

Hindus, in sickness, at marriages and other ceremonial occasions, loose a bull which thenceforward rambles at will without an owner. These haunt the market places and landing places, and large towns such as Benares, the Ranh, Sanrh and Sirhi or widows bulls are numerous. The bulls are generally in good condition, are often in the way but rarely mischievous.

The fair inmate of the mahomedan harem, whom we picture to ourselves conversing with her lover in language too delicate and refined to be expressed by anything else but flowers, uses ordinarily words which would shock the ears of even the most depraved amongst the people of England.

Munn says, there are eight forms of the nuptial ceremony used by the four classes, some good and some bad in this world and in the next," They are termed

Brahma.	Prajapati.	Rashtasa.
Deva.	Asura.	Pisachta.
Rishi.	Gandharvah.	

Munn says "the first six ceremonies in direct order are by some held as valid in the case of a priest, &c., &c. Munn utterly reprobates the idea of Gandharvah marriage. In Chap. III para. 32 he says that by the Brahma, Deva, Rishi and Prajapati marriages, only are born sons illumined by the Veda, learned men, beloved by the learned, adorned with beauty and with the quality of goodness, wealthy, etc. etc., performing all duties and living a hundred years; while from the other four marriages are produced sons acting cruelly, speaking falsely, abhorring the Veda and the duties prescribed in it." And further he declares that "the son of a brahmin marriage, or wife by the first ceremony, redeems from sin if he perform virtuous acts, ten ancestors, ten descendants and himself the twenty first person. A son born of a wife by the Deva nuptials, redeems seven and seven in higher and lower degrees; of a wife by the Arsha, three and three; of a wife by the Prajapatyah, six and six.

"From the blameless nuptial rites of men springs a blameless progeny; from the reprehensible, a reprehensible offspring: let mankind, therefore, studiously avoid the culpable forms of marriage.

"By culpable marriage, &c., &c., great families are sunk to a low state.

A marriage procession in the North-West of India has many elements different from those in Bengal. The months of April and

MARRIAGE CUSTOMS.

May be considered as the most auspicious season for marriage, hymeneal processions may now be daily witnessed in any of the great cities of the North-West. The bridegroom, instead of being carried in a palanquin and followed quietly by a crowd of guests, proceeds in the Upper Provinces on horse-back, with musicians playing right and left, and a band of female songstresses chiming songs suited to the occasion.

The student of social philosophy in determining the stage of civilization at which any nation has arrived, regards as an almost infallible criterion, the degree of esteem in which its women are held. It is only in highly civilized societies that woman takes her proper rank as the equal and companion of man, and as culture declines and intellect narrows, she gradually sinks, till in polygamous communities, the husband only regards the wife as, "Something better than his dog, a little dearer than his horse." The light in which a nation looks upon its women, is not unfrequently reflected in the forms of the national marriage ceremony. With the Spartans, whose women were more respected than any other women of Greece, to commemorate the practice of former days, the bride was seized by the husband and carried away as if by force, though really with the sanction of the parents. In ancient India, the position of the wife was far more honourable than it is in the India of the present day; and against this degradation of the sex, the hindu marriage ceremonies, which have descended from bygone ages, make their constant protest, for in them, the woman is recognised as the first and greatest blessing the gods granted to man. As a hindu poet has said:—

Woman is man's better half;
Woman is man's bosom friend;
Woman is redemption's source;

The whole spirit of the hindu ritual is opposed to polygamy, but inculcates firm and undeviating allegiance to each other on the part of both husband and wife.

Much attention is at the present time directed towards this portion of the Hindu Code. An influential and increasing sect of pure theists, the Brahma Somaj, followers of the celebrated Ran-Mohun Roy, have for some time used a revised ritual in which, while idolatrous invocations of the Vedic and Puranic deities are suppressed and the *One without a Second* is entreated to sanctify the union,—the ceremonies which are not idolatrous and which have been consecrated by the use of ages are preserved. In the opinion of Mr. Cowie, the Advocate General

MARRIAGE CUSTOMS.

of Calcutta, such marriages are however, according to hindu law, invalid. It was with an immediate view to the relief of the members of the Brahma Somaj, that the Honourable Sumner Maine introduced into the Legislative Council of India, his bill to legalize marriages between natives of India not professing christianity, and objecting to be married in accordance with the rites of the Hindu, Mahomedan, Buddhist, Parsee or Jewish religion. The marriage must be solemnized in the presence of a Registrar to be appointed for the purpose, and of at least three credible witnesses, in whose hearing each of the parties make the following declaration: "I, A. B., am a native of British India, I do not profess the Christian religion and I object to be married in accordance with the rites of the Hindu, Mahomedan, Buddhist, Parsee or Jewish religion." The bride and bridegroom are then to repeat words to the following effect: "I, A. B., declare, in the presence of the Almighty God, that I take thee C. D., to be my lawful wedded wife (or husband)."

It is further provided that the husband must have completed the age of eighteen, and the wife must not be under fourteen. If she is under fourteen the consent of her father or guardian is necessary. With the exception of a small section, the Brahma Somaj sect themselves, think that the bill goes too far. They say it makes the marriage contract "a mere civil union, with no more solemnity about it than a trade partnership with community of interest and goods" while the hindu religion, regards marriage as a sacrament, and they have been accustomed to look upon it as the chief of the sixteen religious rites which are to be performed by every pious hindu in the course of his life. They think that while idolatrous rites and ceremonies should be omitted, some religious ceremonies handed down by their forefathers should be made compulsory.

According to hindu law, a girl is marriageable at eight but many are given in marriage from the age of two. After marriage she remains with her parents till she attain maturity, when another ceremony takes place and her husband fetches her to his own house. A brahmin girl who comes to maturity without having contracted matrimony, loses her caste. The duty of choosing a husband belongs to the girl's father; but should he be dead, it devolves in succession upon the paternal grandfather, brother, paternal uncle, male paternal cousins and lastly upon her mother. If these omit to perform their duty till after the girl has reached the age of eight, she may choose

MARRIAGE CUSTOMS.

for herself. She can only marry with those of her own caste and the preference should be given to the sons of her mother's brother or of her father's sister. Strange to say while this preference is permitted and encouraged, it would be considered a dreadful crime to think of marrying the sons of the father's brother, or of the mother's sister; though among us in all these cases, the relationship being that of first cousins, marriage would be equally legal.

In the present day, marriages generally take place when the youth is about twelve years of age and the girl about five or six. We will suppose then, that a father wishes to procure a wife for his son, the preliminaries have been arranged, the girl's horoscope has been consulted and found propitious, and it now remains to find out a lucky day on which the ceremonies shall commence, for, as the Hindu proverb has it, "even good men cannot help so much as good days." This is done, and on the eve of the day fixed upon, a friend of the youth visits the house of the bride elect, and formally gives notice to the girl's father that on the morrow a religious ceremony is to take place in which his favour and assistance will be needed. As an earnest of his readiness to help on the good work, the father of the bride presents the messenger with two cocoanuts. These are afterwards given to the young man, who is informed of the promise of his future father-in-law, and the ceremonies are now commenced by invoking the favour of the gods and propitiating the brahmin gurus with gifts. Vighnesvara, the hindu Janus is especially invoked as the remover of obstacles, and an elephant faced and pot-bellied image is made of saffron to represent him. Saffron is considered as peculiarly auspicious and it is as much in request at hindu marriages, as the traditional orange-blossoms are at weddings in Europe. An earthen vessel filled with water, is then placed upon a heap of rice, the symbol of fertility; the brahmins repeat over the vessel several mantra calling upon Varuna the god of the waters to sanctify the contents, which are then poured over the head of the bridegroom. The boy next assumes for the first time the toga virilis, his eyelids are darkened with powder, a brilliant sectarian mark ornaments his forehead, and on each cheek is placed a "beauty spot."

And here follows a very curious part of the ceremony. He is directed to set out on a pilgrimage to Benares. A staff and an umbrella are placed in his hands; sandals are bound on his feet; he wears a tur-

MARRIAGE CUSTOMS.

ban on his head, and carries a bundle on his back, and a copy of the Vedas, under his arm; for as a brahmachari or bachelor he must be a student of the Vedas. Thus equipped he commences his journey; but he is met by the father of the bride elect, who diverts him from his professed intention by promising to give him a wife. The youth says he is satisfied, and on receiving two more cocoanuts to ratify the promise he returns home. After removing his pilgrim weeds he enters a palanquin, and with his friends, proceeds to the house of his father-in-law. In the front of the house is erected a pandal or booth, made of leaves and branches of trees, and supported on from four to twelve pillars. An even number must be chosen, as they represent married couples. Plantain trees with overhanging clusters of fruit are placed on each side of the entrance, and the inside of the booth is decked with leaves and boughs and fruits of the mango and the areca, and with white jasmine flowers, the symbols of purity. The bride is now brought in, and the innocent little maid seems not at all displeased at her newly-acquired importance and her gay-dress and jewels. A swing is fitted up with a broad seat, and on it the bride and bridegroom are caused to sit. Three female relatives now approach and wash the feet of the young couple with milk three times. They are then swung, while the women chant the praises of their favourite deity, Krishna, the lover of the shepherdesses. Balls of rice, mixed with saffron, are thrown towards the four points of the compass. This is an offering to the gods and the manes, who are all supposed to be present and invited guests. The friends of the bridegroom now approach and give fruits to the bride and his friends make like presents to the bride. The girl's mother then lifts her new son-in-law upon her hip (in the usual way in which infants are carried in India), and takes him thus from the pandal into the house. This signifies that she has adopted him as her own son. While this is going on, songs are sung by the women, and all join in the sanskrit chorus, Gonri, kalyana, Vaibhogame—i. e. "a virgin, a wedding. O joy!" Afterwards a dais is raised within the pandal, and upon this dais the young couple sit in state. Here they are blessed by the brahmins and again the women chant songs of joy. There are five things considered essential to the hindoo marriage ceremony, viz. the betrothal, the gift of the virgin, the acceptance, the seizure of the hand, and the seven steps or *Sapta padi*.

In giving away the virgin, the girl's father

MARRIAGE CUSTOMS.

or guardian must say, in the presence of the brahmins, to the father of the bridegroom. "I give you, for your son, my beautiful virgin daughter, accept her therefore." The father of the youth replies:—"With my mind, with my voice, and with my body I joyfully accept thy daughter for my son and religiously receive her among my own kindred." The girl's father then declares his gotram (tribe) and gives grains of rice tinged with red and betel leaves to the bridegroom, declaring again that he gives him his daughter and promises to defray all the expenses of the marriage. With the girl there should be given one or more cows, some land and a salagram stone.

The girl's father next makes a solemn declaration in the presence of the assembled brahmins, thus:—"O Brahmins! to this youth M. learned in the Vedas, the son of N., to him I give my daughter dressed in gay apparel and adorned with gems."

The brahmins answer; "Tatha astu" So let it be. The father-in-law having taken the hand of his daughter, now puts it into the hand of the bridegroom, and pours over them water sacred to Vishnu. The pouring of water according to Eastern custom, makes a gift irrevocable, and the marriage should be now complete. The Sapta padi and the ceremony of tying on the Tali have however been superadded. The wooden yoke of a bullock used to the plough is brought and lightly laid upon the head of the bride. A veil is then held up between her and the bridegroom, and the mangala ashaga or eight auspicious verses are recited. They form a canticle calling upon the gods, the saints, the trees, the hills and the rivers to witness and to be auspicious to the union. The veil then falls, and the bridegroom binds a golden ornament, called the Tali, around the neck of the bride. This can never be removed except in the unhappy event of her becoming a widow. Then follow the homam or sacrifice to Agni the god of fire, in which the bride and bridegroom take together the Sapta padi, or seven steps amidst the loud chanting of the Vedas. From this observance the term Sapta padinam has become synonymous with friendship; and it is common for two persons to swear eternal friendship; by taking seven steps together. Next comes the ceremony of eating what is called Madhu parkam, literally mead mixture. No mead is now used, but grains of parched rice are substituted, and it is strange that the name of the ceremony is still allowed to perpetuate the memory of the fact, that in times past, the brahmins did not scruple to drink fermented

MARRIAGE CUSTOMS.

liquors, although they now strictly prohibit their use. It is also interesting to observe another evidence of the similarity of tastes and practices which continued to characterize the Aryan races in the East and West; long after their first separation. The old literature of England shows us that formerly the chief glory of an ancient English warrior, was to drink himself drunk on a mead bench. The practice of mead drinking is still kept up in Wales; and it is to this same fermented liquor the poet Grey refers in his lines on the death of Hoor:—

"Wreathed in many a golden link;
From the golden cup they drink
Nectar, that the bees produce,
And the grape's ecstatic juice."

On the third day after marriage, the attention of the bride is directed to a small star named Arundhati near the constellation of the Great Bear, and she is exhorted to follow the chaste example of Arundhati, the wife of the rishi Vasishta, who on account of her conjugal fidelity, was deified and placed among the stars. On the fourth night, a torch light procession sets out and the bride and bridegroom are carried round and round the village in a palanquin, with music and dancing. This goes on till sunrise. They are then conducted home and are received at the threshold by some married women, whose husbands are still living, for the sight of a widow at such a time, is considered most inauspicious. They are then seated and a lamp is waved round their heads to avert the ill effects of "the evil eye;" and for the same purpose, the bride sometimes wears a coral bead with the jewel of her Tali. Somewhat in the same way as the English send round wedding cake and cards, the Hindus distribute betel leaves with the nut of the arca palm, and grains of rice coloured red. The friends of the bride now come to offer their congratulations, and a common wish at this time is:—"May you live long and bear sixteen." It will be seen that while there is in these ceremonies much that is harmless, and that appears to the hindu impressive and venerable from its great antiquity, there is still a great deal that is ultimately bound up with polytheism.

There is occasionally practised amongst hindoos of the Cammattee caste a strange ceremony—the marriage of the living and the dead, the principals being, a living woman, and a dead man. In one case, amongst a section of the Camatti or Kompte caste, the relation that had existed between the living and the dead was of a left-handed nature. They had lived together for many long years as man and wife, when after

MARRIAGE CUSTOMS.

suffering from a febrile attack for only four short days, the man died. Agreeably to the peculiar custom of their caste it was imperative, ere the corpse could be removed for interment, that the sacred rites of matrimony should be performed. The sad intelligence was soon communicated to the neighbouring residents, and to a host of friends and acquaintances, and a fluctuating stream of passers-by. A guru or priest, being summoned, and the necessary preparations for the celebration of the nuptials being hurriedly completed, the ceremony commenced. The inanimate form was placed against the outer wall of the verandah of the house in a sitting posture, attired like a bridegroom, and the face and hands besmeared with liquid turmeric. The woman also was clothed like a bride, and adorned with the usual tinsel ornament over the face, which, as well as the arms and the drapery, were daubed over with yellow. She sat opposite the dead, now addressing it light and unmeaning words,—as is customarily done upon such occasions,—and then chewing bits of dry coconut and squirting it on the face. And thus the ceremony proceeded and continued for three or four hours. At length, as the sun was nearing the horizon, the nuptial ceremony was brought to a close, and the preparation for the interment commenced. The head was divested of its bridal attire, then bathed, and finally laid upon a bier and covered with a cloth of silk. The face was next rubbed over with some red powder, and in the mouth were placed some betel leaves. The widowed bride then looked her last at the shrouded form of him whom never more she would behold, when, amid agonizing shrieks and doleful wailing, the bier was lifted up, and the funeral cortege proceeded in the direction of Sion—one man, preceded the corpse, throwing, at intervals, a handful of pie to the right and left, which were being eagerly picked up.

The Argha offering is made to an idol, a brahmin, to a bridegroom, at the marriage ceremony, or to any venerable person, and on farming operations. It consists chiefly of fruit and flowers, or water, or milk and honey, and when the first bundle of corn is brought home from the threshing floor and deposited, a libation of water is offered between the threshold and the spot where it is so deposited.

The Hindu law does not recognise the second marriage of widows, though seven cases of cohabitation are observed with certain ceremonial rites.

Latterly, however, remarriage of females,

MARRIAGE CUSTOMS.

left-widows before attaining a really marriageable age, is becoming frequent amongst even the most respectable hindoo in Bengal.

Nothing can be crueller or more unwise than to condemn poor girls, left widows at the ages of 7, 8, and 9 years to a life of celibacy. In the instance of a remarriage of a Hindoo widow, celebrated in the village of Chandrokona Zillah, Hooghly, about the middle of the nineteenth century, the bride, whose name was Nilmani Dasi, was the daughter of Baboo Gopi Nath Dutt, of the Kayastha caste, an inhabitant of Bachna in the district of Midnapore. Her first marriage took place when she was only seven years of age; and at eight she became a widow; and at her re-marriage she was twelve years old.

The mere act of being betrothed disqualifies from a second marriage; the affianced becomes a *rand* or widow though a *kumari* or maid.

All brahmins marry with persons who have not the same pravar, i. e. who do not invoke the same Rishi as their ancestor (*Aśvalayana* xii. 15). Apastamba says Thou shalt not give thy daughter to a man belonging to the same gotra or family. Yajñervalgya says, Let a man marry a woman who is free from disease, who has brothers, and who is not the daughter of a man having the same ancestors and belonging to the same gotra as himself.

Kulin marriages are sought after by the relations of the females, to keep up the honour of their families; and the children of these marriages invariably remain with their mothers, and are maintained by the relations of their females, in some cases, a Koolin father does not know his own children.

Exogamy prevails throughout western and eastern Africa, in Circassia, Hindoostan, Tartary, Siberia, China and Australia, as well as in north and south America, but both exogamy and endogamy prevail in India.

The Kocch and the Ho are forbidden to marry excepting within the tribe. The latter at least, however, are not truly endogamous, for as already mentioned, they are divided into 'keeli' or clans and may not take to wife a girl of their own keeli. Thus they are in fact exogamous, and it is possible, that some of the other cases of endogamy might, if we were better acquainted with them, present the same duplex phenomenon.

Silver and golden wedding days appear to be almost as much observed by the Chinese as by the Germans. On these festivals children present parents with magnificently embroidered banners, which are hung up in

MARRIAGE CUSTOMS.

the Ancestral Hall, a large room, so appropriated in the house of every wealthy man. In this apartment, besides these tokens of filial affections, are kept boards, on which are painted, in gold on a scarlet ground, the names and titles of the families with which the family has intermarried. When a woman marries, all the boards from her father's Ancestral Hall are carried in procession before her.

The Gond race of Mandla have the "Lamjina Shadi," in which the betrothed lad serves an apprenticeship for his future wife. A Gond girl, however, may exercise her own will and run off with a man, but it is quite allowable for her first cousin or the man whom she has deserted to abduct her from the man whom she has chosen. The Shadi Bandhone is a compulsory marriage. In the Shadi Baitho, a woman goes to a man's house. Widows remarry either to a younger brother of the deceased husband, or to some other man.

In China, Borneo and the Fiji islands, a father-in-law after his son's marriage never again visits his daughter-in-law and if they chance to meet, he hides himself. In Australia, a man must not pronounce the name of his father-in-law, mother-in-law or son-in-law.

The Hassaniyeh Arabs have a very curious form of marriage, which may be called, three quarters marriage, that is to say, the woman is legally married for three days out of four, remaining perfectly free for the fourth.

Many savages have no ceremony of marriage. The Badaga can scarcely be said to have any. The Karumbar, another tribe of the Neilgherry Hills, have no marriage ceremonies, (*Trans. Ethn. Soc.* Vol. iii. p. 276). According to Colonel Dalton, (*Trans. Ethn. Soc.* Vol. vi. p. 25.) the Kerial of Central India have no word for marriage in their own language, and the ceremony used, appears to be little more than a sort of public recognition of the fact.

Among the Reddi race of the peninsula of Southern India, a young woman of sixteen or twenty years of age may be married to a boy of five or six years. She, however, lives with some other adult male, perhaps a maternal uncle or cousin, but is not allowed to form a connection with the father's relations, occasionally it may be the boy-husband's father himself, that is the woman's father-in-law! Should there be children from these liaisons, they are fathered on the boy husband. When the boy grows up, the wife is either old or past child-bearing, when he in his turn takes up with some other "boy's"

MARRIAGE CUSTOMS.

wife in a manner precisely similar to his own, and procreates children for the boy-husband.

Sir W. Elliot says that in several tribes of Central India, the bridegroom seizes his bride by force, either affected or real; and the same was customary among the Badaga of the Neilgherry Hills.

The hill tribes of Chittagong, says Captain Lewin, regard marriage as a more animal and convenient connection; as the means of getting their dinner cooked. They have no idea of tenderness, nor of chivalrous devotion.

The Kalang of Java, who have some claim to be regarded as the aborigines of the island, are also endogamous, and when a man asks a girl in marriage he must prove his descent from their peculiar stock.

In Ceylon there were two kinds of marriage, the Doega marriage, and the Deena marriage. In the former the woman went to her husband's hut, in the latter the man transferred himself to that of the woman. Moreover, according to Davy p. 286, marriages in Ceylon were provisional for the first fortnight, at the expiration of which they were either annulled or confirmed.

In Sumatra there were formerly three perfectly distinct kinds of marriage; the 'Jugur, in which the man purchased the woman; the 'Ambebanak, in which the woman purchased the man; and the 'Temaudo, in which they joined on terms of equality. In the mode of marriage by Ambebanak, says Marsden, p. 262, 'the father of a virgin makes choice of some young man for her husband, generally from an inferior family, which renounces all further right to, or interest in him, and he is taken into the house of his father-in-law who kills a buffalo on the occasion and receives twenty dollars from his son's relations. After this, the barak baik'nia (the good and bad of him), is invested in the wife's family. If he murder or rob, they pay the bangun, or the fine. If he be murdered, they receive the bangun. They are liable to any debts he may contract in marriage, those prior to it remaining with his parents. He lives in the family, in a state between that of a son and a debtor. He partakes as a son of what the house affords, but has no property in himself. His rice plantation, the produce of his pepper garden, with every thing that he can gain or earn, belongs to the family. He is liable to be divorced at their pleasure, and though he has children must leave all and return naked as he came. The *Somando* is a regular treaty between the parties on the footing of equality. The *adat* paid to the girl's friends has usually been twelve dollars.

MARRIAGE CUSTOMS.

In Bali one of the Islands between Java and New Guinea, girls are stolen away by their lovers, who sometimes surprise them alone, or over-power them by the way, and carry them off with dishevelled hair and tattered garments to the woods. When brought back from thence, reconciliation is effected with enraged friends, by a certain compensation price being paid to her relatives.

In the Korea when a man marries, he mounts on horseback, attended by his friends, and having ridden about the town, stops at the bride's door, where he is received by her relations, who then carry her to his house, and the ceremony is complete.

Amongst the Australians the bride is carried off by force.

Forbes relates that the Kuruwa Koonbi celebrate marriages only under a certain side-reel conjunction, which occurs about once in thirteen years, and hence it is asserted by others, though they themselves deny it, that their unborn children are often contracted in marriage on the chance of their being male and female. A shepherd caste, called "Bhurwad," fix upon a particular year, about once in ten years, for the celebration of their marriages, and they purchase from the Rajpoot chief, or other ruling power, a piece of ground upon which the hymeneal ceremonies are performed. This caste, also, contracts children of the age of two or three months. The ground cannot be employed for marriage rites a second time, but it is retained henceforth in pasture, and never subjected to cultivation. Upon it the shepherds erect an ornamental wooden post, called a "marriage pillar," which is preserved as an indication of the purpose to which the ground has been applied. In the hills near Rajmahal, it is not uncommon for two neighbours when their respective wives are pregnant, to agree, that the offspring, in the event of their being a boy and a girl, shall be married to each other.

In British India, the rule which principally affects the European community is, the resolution of the Governor-General in Council, dated the 8th October, 1852 which prescribes that certificates of marriage should be transmitted to England in every case when either party to the marriage is what is commonly called a British subject, or the legitimate offspring of such a person; and in other cases, whenever either party to the marriage desires it to be so transmitted. Subjects of foreign European states were provided for in 1854, when returns of births, deaths, and marriages of European Christians, of all dominions, throughout British India, were pre-

MARRIAGE CUSTOMS.

scribed by the Governor-General in Council, "European marriages" were explained to include marriages to which Europeans were parties. These rules provide effectually a record in India of all marriages celebrated in the country, and the recording at home of every marriage in which either of the parties is in any way connected with England. It being, frequently, inconvenient to have to refer to a church register in India for proof of a marriage. There are cases in which, from the destruction of the original books, this inconvenience grows into an impossibility. Every marriage between British people, or in which one of the contracting parties is of legitimate extraction from English parents, has become capable of proof by simply referring to the Registrar General in London.

The 'bride cake' which so invariably accompanies an English wedding, and which should always be cut by the bride, may be traced back to the old Roman form of marriage by 'confarreatio' or eating together. The Fiji Islanders have a very similar custom. The act of eating together is, amongst the Burmese, the ceremony of union. Among the Tipperah race of the Hill tribes of Chittagong, the bride prepares some drink, sits on her lover's knee, drinks half and gives him the other half; they afterwards crook together their fingers. Marriage amongst the Romans was of three kinds—the confarreatio, which was accompanied with the most awful religious rites, was practically indissoluble, and was jealously restricted to patricians—the Coemptio, which was purely civil and which derived its name from a symbolical sale and which like the confarreatio gave the husband complete authority over the person and property of his wife; and the Usus, which was effected by a simple declaration of a determination to cohabit. The Usus became general in the Roman empire, and in it, the married woman remained in her father's house and under his guardianship. Her dowry passed into the husband's hands, but, with that exception, she held her property in her own right; she inherited her share of her father's wealth, and she retained it altogether independent of her husband—and thus, a very considerable portion of Roman wealth passed into the uncontrolled possession of women.

During the ascetic stage of morals in Europe, many Romans and Christians regarded a second marriage as improper.

The Roman actresses were slaves,

The Revd. Mr. Ward relates that at a marriage which he saw, the bridegroom came from a distance, and the bride lived in

MARRIAGE CUSTOMS.

Serampore, in which place the bridegroom was to come by water, after waiting two or three hours; at length, near midnight, it was announced, as if in the very words of Scripture, "Behold the bridegroom cometh; go ye out to meet him." All the persons employed, now lighted their lamps, and ran with them in their hands to fill up their stations in the procession; some of them had lost their lights, and were unprepared; but it was then too late to seek them, and the cavalcade, something like the above, moved forward to the house of the bride, at which place the company entered a large and splendidly illuminated area, before the house, covered with an awning, where a great multitude of friends, dressed in their best apparel, were seated upon mats. The bridegroom was carried in the arms of a friend, and placed on a superb seat in the midst of the company, where he sat a short time, and then went into the house, the door of which was immediately shut, and guarded by sepoys; as in our Lord's beautiful parable "And the door was shut!"

Genesis XXIX, 18, relates that Jacob loved Rachel; and said, "I will serve thee seven years for Rachel, thy younger daughter." One of the hindu lawgivers, Vrilhasputee, says, "A person may become a slave on account of love, or to obtain a wife" and in several parts of the East Indies this practice is still followed. Among ladies of Egypt girls are prepared for marriage with a very great deal of ceremony. There are women who make the beautifying of brides their especial profession! using scissors and tweezers freely and skillfully to remove superfluous hair, and train the eyebrow to an arched line, perfecting it with black pigments. A adhesive plaster of very strong, sweet gum, is applied all over the body, letting it remain on for a minute or more; then tearing it off quickly, it brings away with it all the soft down or hair, leaving the skin quite bare; with an unnaturally bright and polished appearance, though much admired by Orientals. The face requires very careful manipulation. In some instances this ordeal slightly irritates the skin, and perfumed sesame or olive-oil is applied, or cooling lotions of elder-flower water are used. The bride invites her friends to accompany her to the public bath previous to the wedding day, and sends to each one a packet of henna, two or three pieces of soap and two wax candles. Bridal parties assemble and sometimes pass three successive days in the luxury of the Turkish bath. Pipes, sherbet, coffee and other refreshments are served, and songs are sung in honor of the bride, who of course forms the centre of

MARRIAGE CUSTOMS.

attraction. Her hair is unbraided, she is slowly disrobed, and then, with her limbs slightly girdled with crimson silk, she is mounted on high clogs, and led through halls and passages gradually increasing in temperature, with fountains overflowing their marble floors; she is placed on a marble platform, near to a jet of hot water; fullers' earth is rubbed on her head, she is lathered with soap, and brushed with a handful of tow; then hot water is poured over her freely, she is swathed in long towels, and by slow degrees conducted back to a more moderate temperature, and lastly to a fountain of cool water. Her companions in the meantime undergo the same process. Then, shrouded in muslin, crape or linen, they sit together, smoking, till they are rested and refreshed. The edges of the eyelids are blackened thus:—a little instrument, like a silver bodkin, is dipped in water, and then into a bottle or box containing an impalpable powder called kohl, made of antimony and carefully prepared soot; the blackened point is drawn gently along between the almost closed lids of the eyes. Poor people use soot alone, and apply it with pins made of lignum vitae. The arms and hands, legs and feet, are bandaged with narrow tape or braid, like sandals crossing and re-crossing each other; then a paste made of moistened henna powder (the pulverised leaves of the henna tree—*Lawsonia*) is spread and bound over them, and allowed to remain on for several hours. When it is removed, the skin is found deeply dyed wherever the tape (which is now unwound) did not protect it; thus a sort of chequered pattern is produced and when it is artistically and delicately done the feet look, at a distance, as if they were sandalled, and the hands, as if they were covered with mittens of a bright orange or bronze colour. Finally, early on the wedding-day, the bride is dressed in her bridal robes; her hair is braided (in what is called the Grecian plait), small pieces of gold-leaf are stuck on her forehead and on her breast; care is taken not to conceal any of the stars or spots tattooed on her face or chest in infancy; a line of blue dots encircling the lips is sometimes seen, and a spot on the chin is very common. A little rouge is added to heighten the color of the cheeks when considered necessary.

In India left-hand marriages are common amongst both hindus and mahomedans, and are considered by no means disreputable. On the ground of disparity of rank, left-hand marriages are still sanctioned in Germany, but they seem not essentially different from those here alluded to.

MARRIAGE CUSTOMS.

In the old Roman forms of marriage, *confarreatio* was the most sacred and the bride and bridegroom were joined together by the Pontifex Maximus in a set form of words, in the presence of at least ten witnesses, the contracting parties having to partake of a cake made of salt, water and flour, called *far*. Of that *panis farreus*, the wedding cake of the British is the relic and their bridesmaids and groomsmen have their origin in the ten witnesses. Amongst the Romans, special honour was given to the children of such marriages and from amongst them were chosen the flumens of Jupiter and the vestal virgins.

In certain African tribes it is deemed a most gallant act for a lover to ride into the presence of his sweet heart, astride a fine boar pig.

Amongst the hindoos of Guzerat, the general rule is that betrothal cannot be set aside, but the practice of different castes varies. Among Rajpoots, if the betrothed bridegroom die, the girl who should have been his wife is treated as his widow, and considered incapable of entering again into the married state. Some brahmins, on the other hand, do not consider themselves bound either by betrothal or by any other ceremony short of the actual joining of hands in marriage. In most castes a betrothed bride is not treated as a widow on the death of the affianced, and in many she may, with permission of the caste, marry another person even in his life-time, should he, before the marriage is concluded, become afflicted with any serious disease. The Karuwa koonboo, when they cannot procure a husband for their daughter, will sometimes marry her to a bunch of flowers. The next day they throw the flowers into a well, and the bridegroom thus disposed of, the widow is eligible for "natra," or second marriage. A similar practice is that of marrying the girl to a person called "a hand husband." This bridegroom may be any male of the caste who is willing to contract, beforehand, that he will receive a certain sum for a divorce and give his bride a release from her marriage the moment the ceremony has been performed. The wife so divorced may then marry in natra. The object of these proceedings is the avoidance of expense. No money need be spent by the bride's father upon a "natra" marriage, except such as is required for entertaining the friends who accompany the bridegroom. The lady's trousseau is supplied by her husband. An unmarried woman cannot, however, be given in natra. About twenty days before the marriage, the house of the parents

MARRIAGE CUSTOMS.

are carefully cleaned, and adorned by the wealthy with strings of pearls, handomely embroidered curtains, and by the poor with garlands of leaves. In front a temporary building, called *mundup*, is erected, which, in the case of poor persons, is merely a thatched hut, but where the higher classes are concerned, is frequently a very brilliant pantomime-like edifice, lined with mirrors and adorned with lamps, rich curtains, soft carpets, and abundance of tinsel. Near one of the corners of the *mundup* a wooden post, called a "jewel-pillar," is set up, adorned with flowers and other ornaments, and worshipped. Within the *mundup* the planetas, Ganesh, Vighn Raj, and the progenitors are worshipped,—the last mentioned, in order that the household may not, so long as the ceremony lasts, be rendered unclean by the occurrence of a birth or death in the family.

A ceremony, called "Gotrnj," is performed within the dwelling-house. A flat surface of wall having been whitened, a pyramid is made upon it of red spots, which increase from one at the apex to seven at the base. Below the base line other seven spots are made with clarified butter, which the heat causes gradually to trickle downwards. The figure, which represents a genealogical tree, becomes the subject of adoration. The bride performs a ceremony called "Nyoon-chun," in which she expresses by significant pantomime the worthlessness in her eyes of even the necessities of life in comparison with her beloved child. Around his head she waves a cake of bread and then a cup of water, both of which she throws from her; she next takes in her hand the "sumpot," which is composed of two vessels full of rice fastened together mouth to mouth.

According to the Revd. Mr. Ward, in Bengal, after entering the house, the bridegroom is led to the place where the marriage rites are to be performed, and where the father-in-law, taking off the old garments and poita of the boy, arrays him in new clothes, and takes him into an inner apartment, where they make him stand on a stool placed on the cow's head and certain other things buried in the earth, adding a number of female superstitious practices, to induce the bridegroom to behave well to the bride. They next bring the bride on a stool covered with the bridegroom's old garments, and carry the girl round the bridegroom seven times, they then permit the bride and bridegroom fairly to look at each other for the first time. The pair are then brought to the former place, and made to sit

MARRIAGE CUSTOMS.

near each other, when the father-in-law puts into the hands of the bridegroom fourteen blades of *kooshu* grass, tied in two separate parts, which the boy ties under his feet. The father-in-law now pours some water into the right hand of the bridegroom, and while the latter holds it there, the former makes an incantation, at the close of which the bridegroom lets it fall on his feet; rice, flowers and *doorva* grass are next given, which he lays on his head; water is presented as at first with a prayer; and then sour milk: then again water. The officiating brahmin now directs the boy to put his hand on a pan of water, and places the hand of the bride on that of the bridegroom, and ties them together with a garland of flowers, when the father-in-law says, "of the family of Kasyapa, the great grand-daughter of Bhairava, the grand-daughter of Rama-Hari, the daughter of Rama-Sundara, Kshama, wearing such and such clothes and jewels, I, Thakura-dasa, give thee, Ribhaya-charana, of the family of Sandilya, the great-grandson of Sundara-dara, the grand son of Kanai, the son of Bhaja-Hari." The bridegroom says, "I have received her." The father-in-law then makes a present, for good luck, and adds to it household utensils, &c., according to his ability. He then takes off the garland of flowers with which the hands of the married pair were bound, repeating the *gayatri*. A cloth is now drawn over the heads of the couple, while they again look at each other; and this part of the marriage ceremony here closes, after the boy and girl have been directed to bow to the *salagramma* and to the company, that they may receive the blessing of the gods and of the brahmins. A brahmin or a woman whose husband and son are living, then fastens the bride and bridegroom together by their garments with the above piece of cloth, as a token of their union; and they are thus led back into the midst of the family.

It was a custom amongst several Seythie races, for widows not to remarry on the demise of their husbands, but to burn themselves or be buried alive or to be destroyed by the sword or dagger and interred along with their husbands remains. This practice prevailed in the East Indies up to the middle of the eighteenth century, when it was prohibited by the British, but it is still followed in some of the islands of the Eastern Archipelago. In a Government Notification in the Foreign Department, Simla the 7th April 1847, the Governor General expresses much satisfaction in publishing a translation

MARRIAGE CUSTOMS.

of a proclamation by the Gwalior durbar, received from the Governor General's Agent for the affairs of Scindia's dominions, prohibiting the practice of *suttee* within the territories of maharaja Scindiah.

The Political Agent Jeypoor, having collected the *shastrees*, made enquiries of them regarding *suttee*, and they said that the custom was iniquitous, and that this custom was prohibited by the Jeypoor Government. This durbar had previously issued verbal orders prohibiting this custom, and a proclamation was then issued to the effect that the *amils* should take precautions, and call on the *zemindars*, *chowdrees*, *kanongoes* and other officers, not to allow a *suttee* to take place in their villages. If a *suttee* take place in any village, and the *zemindar* do not give information to the *sirkar*, such *zemindar* shall be imprisoned for twelve years, and if any *amil* after having received information of a *suttee* being about to take place, do not prevent it, such *amil* shall be deprived of his situation.

The Governor General also in 1847 published for general information, documents received from the Governor General's Agent at Rajpootana, prohibiting female infanticide in Jeypoor, and limiting the demands of the religious *bhat*, *charan*, *dholi*, and *merasi* sects, on occasions of marriages in Rajpoot families.

In Guzerat, amongst some castes, a man is allowed to marry as many wives as he pleases, a Rajpoot sometimes marries twenty, an Ondieh brahmin frequently five or six; in other castes, a man may not marry a second time in the life-time of his first wife. Rajpoots never permit the re-marriage of a widow, but in some of the other castes, a woman may remarry more than once. Sometimes it is allowed to a husband and wife, who disagree, to separate by mutual consent, which is signified on the part of the woman, by her tearing the hem of her garment, and on that of the man, by his giving his wife a deed of release. In some castes, it is considered indispensably necessary that girls should be married before they are twelve years old; in others, a husband of high family is much sought for, and women remain unmarried at the age of thirty.

Adi Sur, the founder of the Sen dynasty, brought from Kanauj, five Sagnie brahmins of the tribe or gotra *Sannila*, *Kashyapa*, *Valsa*, *Saveria* and *Bharudwaja*. *Sndra* families, *Ghose*, *Base Datto Gaba* and *Mitra* accompanied them and these take the position of *Kulin Kaists*. In the reign of *Bulla Sen*, about 284 years before the mahomedan invasion, all these *kulin brahmins*

MARRIAGE CUSTOMS.

and kulin sudras had greatly increased, and though degenerated in learning they arrogated to themselves a position above all the sapta-sali or aboriginal brahmins. Bullal Sen ennobled the brahmins by giving to them the title of Kulin. The kulin brahmin subsequently consented to marry the daughters of the aboriginal brahmin, who eagerly seek alliances with the kulin, who take advantage of this and have established a scale of fees for condescending to accept a daughter of an inferior. They marry for gold. Of the Kayasts who came from Kanonj, Bhaise, Ghose and Mitra were ennobled by Bullal Sing with the title of Kulin Kayasts. Dass, Day, Dutt, Guha, Kar Panlit, Sen and Sing hold a second rank.

Kulin brahmin women are married with difficulty and generally to aged men. In 1868, there were 11 kulin in Hooghly and 1 in Bardwan, each of whom had contracted 50 to 80 marriages:—24 in Hooghly and 12 in Bardwan, who had contracted from 20 to 50 marriages and 48 in Hooghly and 20 in Bardwan, who had contracted between 10 and 20 marriages.

Kulinism is thus a great polygamic institution and a few women have become prostitutes. In 1867, the abolition of this polygamy was contemplated and will doubtless soon be carried out.

Perhaps there is no portion of the world of the same size, in which could be found so many varied customs as regards marriage and married life as prevail in India. Although in ancient times, about the commencement of the Christian era, the ancient drama of the Sæontala shows the heroine not married till an adult age, in the present day, most of the marriages among the hindus are celebrated while the bridegroom and the bride are mere infants, and on these occasions even the most parsimonious parsi, or hindu and mahomedan are wont to expend extravagant sums on the ceremonies. Polygamy amongst the respectable settled people, is probably not more frequent than the irregularities of married men in Europe, indeed is almost unheard of, except among the idle, the extremely wealthy and that race of Kulin brahmins, of Bengal, the honor of an alliance with whom is so great that families give their daughters in wedlock though they may already be seventy or eighty wedded wives. In the bulk of hindu society, the wife is a mere servant to her husband, works for him, cooks for him, washes for him, but does not eat with, or walk with him, and to pronounce her husband's name would be regarded as an act of gross immodesty. Amongst many of the hindu people too, the

MARRIAGE CUSTOMS.

customs of the mahomedans have been introduced, though in some parts of India, as in Bombay and the Deccan, women of good caste are allowed more freedom of action. There seems reason to believe that among the aboriginal races of India the practice of polyandry prevailed largely. It exists now among the Toda, who are a Tamil race; among the Khandyan in Ceylon, although they are reluctant to admit the fact, and amongst the Coorg race. From some texts in Menu (cix, p. 59,64,66) it would seem that in early hindu society it was permitted to the sudras, and in the epic poem, the Mahabarat, the five brothers Pandu are married to the same woman. But probably the most remarkable form of marriage which ever existed, is that which prevails amongst the Nair of Malabar, a Sudra race who form the military caste and aristocracy of that part of India. Until the conquest of their country by Hyder Ali, in 1759, the reigning families in the different rajahships, were all of this caste. With them the custom is, for a woman on marriage not to leave her mother's house, or even to consort with her husband. It is his duty to provide her with clothing, food and ornaments, but he is not recognised, as indeed he could not be, the father of her children, for temporary association is allowed to her with any one, provided he be of equal or higher caste to herself. On the death of her mother, the wedded Nairine lives with her brothers, and as a consequence of this strange custom a man's heirs are not his own children, for them he does not know,—but the children of his sister. The Zamorin of Calicut who was the reigning prince on the Malabar coast, when the Portuguese under Vasco de Gama first effected a settlement, in 1498, belonged to the Nair caste, and his descendants are to be found there. The eldest son of the eldest sister, always succeeds to the title, for the sovereignty was lost under Hyder Ali and Tipu's supremacy, and Ibn Batuta found the same rule of succession in operation when he travelled through Malabar about 1340.

In the Psalm lxxviii. 63, it is said 'Their maidens were not given to marriage.' This is described as one of the effects of God's anger upon Israel. In Hindu families the marriage of daughters is sometimes delayed, but this is always considered as a great calamity and disgrace. If a person see girls more than twelve years of age unmarried in a family, he says, 'how is it, that that brahman can sit at home, and eat his food with comfort, when his daughters, at such an age, remain unmarried.'

Writing of the Khond race of Orissa,

MARRIAGE CUSTOMS.

Major General Campbell says that on one occasion he heard loud cries proceeding from a village close at hand, fearing some quarrel, he rode to the spot, and there he saw a man bearing away upon his back something enveloped in an ample covering of scarlet cloth, he was surrounded by twenty or thirty young fellows and by them protected from the desperate attack made upon him by a party of young women. On seeking an explanation of this novel scene, he was told that the man had just been married, and his precious burden was his blooming bride, whom he was conveying to his own village. Her youthful friends (as it appears is the custom) were seeking to regain possession of her, and hurled stones and bamboos at the head of the devoted bridegroom, until he reached the confines of his own village.

In the hindu marriages, the *kanya dana* is the giving of the bride in marriage and *kanya pañi-grahana* is the act of the bridegroom taking the bride's hand. In northern India, part of the marriage ceremony consists in tying a string or thread round the wrist of the bride and with many of the races in India, whether of Arian or Turanian descent, part of the marriage ceremonial consists in tying the corners of the bride or bridegroom's cloths together (*Phylu bandhna*) and causing them to circumbulate the village deity.

There is also the ceremony of "sat-pher," or seven turns round the sacrificial fire.

Professor Wilson explains the term "gotra" as meaning a family, lineage, relationship by descent from a common ancestor of the same name; a family, a tribe, who reckon their descent from some celebrated saint or regard him as their primitive spiritual head, and whose designation they bear, as the Bharadwaja-gotra, Kasyapa-gotra, Sandilya-gotra, &c. In Vol. II. p. 12, of the Hindu Theatre, Professor Wilson says, it is asserted that thirteen gotra or families of brahmins own their origin to as many divine sages called after their name. Kasyapa (Kusip) is one of the number. The Aswalayana Sutra of the Rig Veda contains the enumeration of the gotra, and their subdivisions, but in a very involved and unintelligible style. The popular enumeration of them, however, is not uncommon; but it is nearly, if not wholly, confined to the south of India, where several of the reputed representatives of these tribes yet exist. He also says, at p. 3, of his note to "Johnson's Extracts from the Mahabharata" that in the South of India, brahmins are still found pretending to be sprung from some of the patriarchal families. This, however, is not correct, for, throughout the entire penin-

MARRIAGE CUSTOMS.

sula every brahmin claims his own Got, every marriage is regulated by the Got, and no brahmin marries into his own Got.

In common parlance, Got has the same meaning as the more classical Gotra of Wilson's Glossary. Properly, those only are Got, which bear the name of some Rishi progenitor, as Sandilya, Bharadwaj, Bishisht, (Vasishtha), Kasyapa; but it has become the custom to call each sub-division of a tribe a Got, and according to the Nirṇayo Sindhi, there are no less than ten thousand. The early genealogies of the Rajpoots frequently exhibit them as abandoning their martial habits; and establishing religious sects, or gotra. Thus, Reh was the fourth son of Proowa of the lunar race: from him, in the fifteenth generation, was Harita, who with his eight brothers took the office of religion, and established the Kausika Gotra, a tribe of brahmins. According to Colonel Tod, both Got and Kaup, denote a clan, and in Rajputana its sub-divisions have the patronymic terminating with the syllable 'ote,' 'awnt,' 'sote,' in the use of which euphony alone is the guide: thus, Suklawnt, 'sons of Sukta;' Kurmasote, of Kurma; Mair-awnt, or Mairote, mountaineers, 'sons of the mountain.'

The expensiveness of marriages in India has been a great curse, generally leading to infanticide. In the year 1850, when the foster brother of the nabob of the Carnatic was married, about £10,000 were expended in idle ceremonial. More recently, the Gnicowar of Baroda on the demise of his first wife married a second time. The preliminaries took a long while to arrange, and the result was exceedingly curious and magnificent.

The 19th Regiment B. N. I. furnished a strong guard of honour, which went down to the city in the morning, and there remained inert till about 4 o'clock in the afternoon, when the Gnicowar passed by and was received with all the honours. The Resident, with other gentlemen of the camp, went down to the city in carriages, about half-past two; and then the grand procession commenced. His Highness was got up in the highest style of Eastern fashion, and all in yellow,—that being the correct colour for the occasion. A perfectly tight fitting satin jacket and continuations, together with a quaint head-dress, of a shape between a mitre and a beehive, gave a brilliancy to his appearance which was absolutely dazzling; and the occasion and the glowing yellow reminded the devout beholder of the "sun," which cometh forth as a bridegroom out of his chamber." His Highness mounted a

MARRIAGE CUSTOMS.

remarkably fine horse, apparently of a bay colour: but so hidden under his finery that he was almost invisible. The saddle cloth was especially gorgeous, of brocade, and *kiakub* or cloth of gold. The Guicowar, having settled himself down in his seat, led the way to home and beauty, followed by the English gentlemen on elephants, and all the nobles of the court and retainers. The streets were lined with troops, the Highlanders, the Khaki Regiment, and the Rifles, also the Cavalry. The procession passed on its way, winding through the city till it arrived at the bridal abode, which was very tastefully ornamented and fitted up. Close by this little place, the English gentlemen retired to a house where refreshments were provided for them. After a little while they were summoned to the Presence, and now for the first time appeared the bride, modestly and thickly veiled, sitting on a basket. The bands played, the guns thundered a royal salute, the soldiers fired a *feu de joie*,

"Twas not the air, 'twas not the cure,
'Twas not the *feu de joie* that runs
Fair up and down the double rank,
But one glad shout that softly sank,
At once a thousand voices said
"It is the veiled Maratha maid!"
The Guicowar, who had felt the strain
Deepest of any, and had lain
Some minutes rapt as in a trance,
After the fairy sounds were o'er,
Too late touched for utterance
Now motioned with his hand for more

The bride, as is customary, sat on a basket, and her royal lover sat in front of her, apparently holding her feet, and fine cords were then wound round the two contracting parties to betoken the indissoluble nature of the bond between them.

Amongst hindoos a marriage may be concluded at any time from infancy, as the parents may please. But amongst the priestly and mercantile orders, the brahman and vaisia races, as also among the goldsmiths, girls must be married before they attain puberty. The brahmans believe that they would be as if guilty of murder if they allowed a girl to grow up before being married. And in southern India they, as also the goldsmith tribe or race or caste, regard such an occurrence with so great horror that, theoretically, they consider it would be incumbent on them, if it happened, but which is invariably guarded against, for all the family to drown themselves. In reality, there is no such great care taken in the artisan classes, and with the Kayastha race, their young women are rarely if ever married till grown up. Amongst hindoos in general,

MARRIAGE CUSTOMS.

children have no voice in the matter of their marriage. When parents are desirous of having their sons married, they institute inquiries amongst their relatives or friends not of their own 'gotram,' or tribe. They visit her parents in a propitious hour, and request their daughter in marriage for their son. The parents of the girl make inquiries as to the character of the boy, and, if satisfied, they promise their daughter for him. It is not customary for a girl's parents to go seeking for a husband for their daughter. When so far arranged, if the girl's parents be poor, they may perhaps stipulate that jewels and money shall be presented to their daughter, at the marriage time. But this practice, which is a remnant of the ancient custom of purchasing a wife, is gradually dying out with all but the humbler people. Now a days, a rich hindu would disdain to receive money from the parents of their son-in-law, for giving their daughter to him, and many tribes, for India contains the descendants of numerous distinct races, repel with disdain any insinuation of their readiness to sell their daughters. Indeed sons-in-law do, now, occasionally, receive some dower of money or property with their brides. But the former practice of disposal of their female children, is clearly marked in their marriage law, in which a girl who quits her father's house for her husband, in another family, ceases to be an heir of her own parents, though she acquires rights in the property of her new home.

When all the preliminary arrangements are settled, a day is fixed for the performance of the marriage: preparations are made by the father of the girl, who invites relatives and friends to be present on the occasion, the invitations being usually communicated verbally, but sometimes by letter. On the day preceding that of the marriage, by the Svat'haka Varuttam rite, the youth is relieved of his bachelor-hood, the ceremony on this occasion consisting in the homa or fire sacrifice and giving of charity. On the marriage eve, the bridegroom, accompanied by his parents, relatives and friends, goes in procession to the bride's house, and presents her with a new cloth of some value and with the jewels that may have been before agreed on; betel nut is handed to the guests, and friends and relations are entertained. The poor brahmans, too, are remembered on the occasion, the money gifts to whom are called *Datchana*. The wedding day at length arrives, but with emotions very different from those of the principal actors in ancient hindu times, for, now-a-days, both bride and bridegroom are usually quite infants—and

MARRIAGE CUSTOMS.

if not both so, the bride with most tribes certainly is. Tribes of sudras, however; and a fair intellectual literary race called kayast'ha, or kayast'h, who claim their origin from a deified mortal called Chatragoputr, also many of the pariah tribes, allow their girls to grow up and remain in their fathers' house without any feeling of impropriety being associated with the practice. And the Vedas teach us, that in their times, virtuous maidens remained unmarried in their fathers' house long after they had grown up. On the wedding-day, the bride and bride-groom, are anointed with oil (the Abhiangana-s'nanam), are dressed in their best and are decorated with jewels. The father of the bride has erected a temporary canopy in the court of his house, beneath which she is seated beside her groom, and the family priest commences the ceremony by causing them to make a burnt offering by the Homa sacrifice—of pouring ghee into the fire,—whilst the priest utters a mantra or invocation. At the same instant, by the Navagraha Aratanam, and Asht'ha dik palaka aratanam, a series of incantations, they bring Indra, Varuna, Agni, Yama, &c., from Swarga-lokam and locate them in any casual article, in some part of the house.

When seated, the girl is formally given to the husband (Kauia-danam) literally spinster giving: a priest blesses some water in a small vessel, and the father of the girl taking this and his daughter's right-hand places them together in the bridegroom's right-hand, saying I do this that my father, grandfathers, and great grand fathers may attain (Swarga) heaven. The bridegroom then rising, and standing before the bride, amidst the deafening din of tom-toms, ties round her neck the mangala sutram, a thread coloured with turmeric to which a golden jewel called Bottn or Talai is attached. Sandal wood paste, perfume, and flowers are presented to the guests, betel-nut is offered to all relatives and friends and many presents are made. The married couple receive 'Asir-vadam' benedictions and congratulations from the assembly, and as they prostrate themselves at their parents' feet, their parents bless them.—*Mrs. Spence's life in Ancient India* p. 281. *Sir John Lubbock, Orig. "

This small creeper grows in the peninsula
of India, in the Rajmahal Hills, Palamow,
Nepal and Chittagong. It has small green-
ish yellow flowers; from wounds made in
this shrub, a milk-like juice issues which
hardens into an elastic substance, with prop-
erties like caoutchouc, and from the bark,
beautifully fine silky fibres are obtained
which are made into bow-string *Rozb* ii. 51.

Asclepias tinctoria *Rozb.*

Pergularia tinctoria *Spr.*

Cynanchum tinjoris *Herb*

Hann

This creeper, one of the order *Asclepi-*
aceæ, grows in both the Peninsula of
India, in Assam, Silhet, Pegu, Tenasserim
and Sumatra. The plant yields a blue dye,
and Dr. Roxburgh recommended its ex-
tensive cultivation. The Burmese obtain
from it quite a good indigo blue, though not
equal to the dye from the *Ruellia*. The
Javanese, who of all the Malayan race have
certainly made the highest progress in all the
useful arts, have a specific term for dyeing

MARSHMAN.

or tinting,—“madal;” but the Malays ex-
press it only by the word for dipping,
“chalup,” and the only generic words
which either of them possesses for “colour,”
are the Sanscrit, warna; and the Portuguese,
tinta. Their colours are usually sombre,—
little varied, but generally fast. Blues are
always produced from indigo, yielded for the
most part by the *Indigofera tinctoria*, as in
other parts of India, but in Sumatra, occa-
sionally, from this plant, the *Marsdenia tin-*
ctoria. Yellows are produced from the
woods of two species of *Artocarpus*, the
jack and champadah, and from turmeric;
and reds from the bark of the root of the
“mangkudu,” the *Morinda umbellata*,—from
the “kusumbajaiva,” or safflower, *Carthamus*
tinctorius, from the “kusumba-klung,” which
is the annatto, or *Bixa orellana*, from the
sapang, or sappan wood, *Cesalpinia sappan*,
and from the mids of the lac insect. Black
is produced from the rinds of the mangostin
fruit, and of the “Katapang,” *Terminalia*
catappa, with sulphate of iron. Sails and
nets are dyed, and perhaps also tanned with
a wood called in Sumatra, “nbar” which is
the *Ricinus tanarius* of botanists. The inor-
dants used are rice-bran, and alkalis from the
combustion of some vegetable matters, as
the fruit stalks and mid-ribs of the coconut
palm and alum brought from China.—*Craw-*
ford: Mason; Voigt 537 *Roeb.* ii 43.

MARSH DATE or Ground Rattan, is the
Calamus rotang or common cane plant: its
leaves are used at Cuddalore for making
ropes and mats.

MARSII-DATE PALM. *Phoenix palu-*
dosa.

MARSH MALLOW. *Althæa officinalis*.
A syrup of this is a mucilaginous demul-
cent, and for the same purposes may be
prepared syrup of *Bombax malabarienum*
root,—of dried *Abelmoschus esculentus* cap-
sules, (okra),—of *Asparagus sarmentosus*,
(soota mooll),—of *Bilva* fruit, (bel.) *Ægle*
marmelos. These syrups all spoil very ra-
dily.—*Beng. Phar* p. 407.

MARSHMAN, Joshua, colleague of Ca-
rey and Ward, born in 1768, at Westbury
Leigh, the son of a weaver and Baptist mi-
nister. He arrived in India in 1799. He
had many bitter personal enemies, possibly
caused by something in his manner, and
from his entertaining the mistaken theory
that men are most easily controlled by ma-
nagement and conciliation, from acting on
which many supposed him to be a schemer
and insincere. But though he stated his
views with moderation, he was unbending
on matters involving a principle.

MARWAR, HIND. *Bauhinia racemosa*.

MARWAR is a corruption of Maroo-war, classically Muroost'hali or Moorooost'han, the region of death. It is also called Maroo-desa, whence the Mardes of the early mahomedan writers. The bards frequently style it Mord'hur, which is synonymous with Maroo-desa, or, when it suits their rhyme, simply Maroo. Though now restricted to the country subject to the Rahrar race, its ancient and appropriate application comprehended the entire 'desert,' from the Sutlej to the ocean. The sac'-line or branches of the Rahrar, early spread over the desert. The fabulous genealogy of the Rahrar deduces their origin from the raht or spine of Indra, their nominal father being Yavan-aswa, prince of Pailipar, which they say was somewhere in the north. This indicates their Scythic origin, the Asi or Aswa being one of the four Scythic peoples who overturned the Greek kingdom of Bactria. Doubtless the Indo-Scythic people from the Oxus to the Ganges were one race and ancient hindu cosmographers claim the Aswa as a grand branch of their early family. But there are no available data for any of the great Rajput families beyond the fourth century of this era. This was the period of one of the grand irruptions of the Getic races, from Central Asia, who established kingdoms in the Punjab and on

MARWARI.

the Indus, and that they were a pastoral race is evidenced by the term Pal or Pali, which is an adjunct to every proper name. In the scant records of Alexander's invasion, mention is made of the Asasenae and Asacani as still dwelling in the countries on and beyond the Indus, but the period of the fourth century, at which time the Hun, the Parthian and the Gete had founded colonies on the western and northern frontier of India, was fruitful in change to the old established dynasties of the hindu continent. Marwar, in 1868, continued to be greatly misruled. At the commencement of 1869 the Political Superintendent of Serohi discovered that, both in that state and in Marwar, the practice of Samadh, or burying alive, prevailed to a considerable extent, though confined almost entirely to persons in the last stage of leprosy, by whom it was practised to put an end to their sufferings. As it was thought probable that in some cases priestly influence, and in others the desire of the other members of the family to rid themselves of the presence of a nuisance, might have induced the self-sacrifice, the Political Agent considered it advisable to bring to the notice of the Darbar of His Highness the rao of Serohi, that Government regarded the commission of a Samadh in the same light as a suttee, and that they would expect His Highness to use his best endeavours to put a stop to it. It was also notified that in case of his not doing so, he would incur the displeasure of Government, and the number of guns with which he was saluted would be reduced. His Highness at once issued a proclamation declaring that Samadh was forbidden, and that any one assisting at any case in future would be liable to imprisonment extending to ten years, that the jaghirdar on whose estate it took place would be liable to the same punishment, and the forfeiture of his estate, and any raj official, through whose culpable neglect a case might occur, would also incur the same liability. The maharajah of Marwar was also addressed on the same subject, although the Political Agent of that province could not hear of any cases having occurred.—*Tol's Rajasthan*, Vol. II, p. 9. *Englishman*, April 25. See India.

MARWARI, from Marwar, a country in Rajputanah, but in India generally applied to a native of Rajputanah, engaged in banking or trade. There are, however, in India, various tribes who are known as bankers, soukar, and surraff or shroff, viz. the Marwari, the Bhatya, the Vesya Komati, the Modi grain seller and the Bania. The Marwari of Marwar in Rajputanah

MARWARI.

arrange themselves into twelve tribes, amongst whom are the Mestri, Agrwala, Urwar, Oswal, Sarogi, Kandelwal, Bijabargi, Porwal, some of these are hindus, and some are of the Jain sect. The Mestri, the Urwar, Bijabargi, Kandelwal and Porwal are of the vaishnava sect of hindus; the Agrwala are partly vaishnava and partly jain, but the Sarogi and the Oswal are wholly jain and it is from amongst the Ossi tribes of Oswal that the jain priests of Abu are chosen. They never use animal food, their offerings are fruits and sugar, and the Oswal and Sarogi never eat the prasadh or meat offered to the idols. Those races are less frequently of the saiva sect. The Marwari, the Vanya Komati, the Modi grain-seller and the Banya, are distinct races, altogether dissimilar in personal appearance, the Marwari from the desert being tall, bulky, yellow men, while the Wani or Banya of the peninsula are, a smaller and dark colored race. The Marwari mercantile men and bankers hold almost exclusively the entire banking business of India. The Marwari of Jeypur regulate the exchange operations of almost all the nations of India. Colonel Tod tells us that they are of Rajpoot origin, and that the Oswal is the richest and most numerous of the eighty-four mercantile tribes of India, and is said to amount to one hundred thousand families. They are called Oswal from their first settlement, the town of Ossi. They are all of pure Rajpoot birth, of no single tribe, but chiefly Para, Solanki, and Bhutti. Many profess the jain tenets, and it is a curious though little known fact that the pontiffs of that faith must be selected from the youth of Ossi. The wealthy bankers and merchants of these regions, scattered throughout India, are all known under the denomination of Marwari, which is erroneously supposed to apply to the Malwah and the Jodpoor territory, whereas, in fact, it means belonging to Maru, or Marust'han, the desert. It is singular, he adds (*Rajasthan*, Vol. II., p. 234) that the wealth of India should centre in this region of comparative sterility. The Marwari is essentially following similar mercantile pursuits to the Vaisya Komati of peninsular India, and those of the Wani or Bani or Banya, viz., banker and merchant, to which however the Komati add that of retail shop-keeping. If a Marwari engaged in business in the peninsula, be asked as to his caste, he replies that he is a Malajan, a Bania, a Bais, or Vais, meaning that his profession is that of the commercial people. But on further questioning, he explains that originally the Marwari was a Rajpoot, that there are

MARYA CADAMBA.

twelve great tribes, of whom are the Oswal, Messar, Agarwala, Bejabargi, Saraogi, Nedatwar, Parwar, and five others. These all subdivide into innumerable kap or clans; in the Messar tribe alone are 72, amongst whom are the Rathi and Dhaga. All the Marwari of Rajputanah adhere to the gotra principle, reckoning their descent from a founder, and in their marriage ceremonies they abstain from blood relationship, never marrying into their own gotra; they seem to be of Aryan origin. Their widows never remarry. It is a curious and little known fact, that almost all the mercantile tribes of Western India are of Rajpoot origin, and sank the name and profession of arms when they became proselytes to Jainism, in the reign of raja Bhoem Pramar. The Cheetore inscription (see Vol. I, p. 799, and note 7, p. 800), records the name of this prince. He was ancestor of raja Mann, whose date S., 770 (A. D. 714), allows us to place this grand conversion prior to A. D. 650. The Banya or Komati are generally of the vaisya sect of hindus, though some of them worship Siva. They are most numerous in Telingana and in Madras. In the north and east of Dekkan proper there is not one of them in twenty villages, their places then being taken by the Marwari race. There are however many in Panderpur, and Sholapoor. Those of the Komati who die unmarried, are buried, all others are burned whether belonging to the saiva or vaishnava sects. Their language in their families is Telugu, and it is spoken by them as far as Bombay. But as the west is approached, Maharati becomes mixed with it. The Banya are essentially shopkeepers, sellers of dry grains, doing a little in mercantile business and cultivate, but do not hold the plough. They are mostly dark men, of short stature. In their marriages the bridegroom may or not be before or after puberty but girls are under age and the ceremonial is performed at the house, by a brahman. The death shrad are conducted by brahmins. Their janawi or zonnar is put on and the mantra taught when married. The Wani of the Western Coast will only marry with the Komati Banya. They are in considerable numbers in the northern part of Hyderabad, adjoining Berar.—*Tod's Rajasthan*, Vol. II. p. 134, 234

MARWARID. AR. Pers. a pearl.

MARWAT and Baun are on the same plain. The people of Marwat are larger in stature than those of Baun and are usually clad in coarse white linen like the Afghans on the banks of the river Indus.

MARYA CADAMBA, TAM. ? A Travancore

MASAH.

core wood, of a yellow colour; used for packing cases.—*Col. Frith.*

MARYUL or Lowland, from mar, Tin. low, and yul, land, the non-Chinese portions of the Bhot territories. These are arranged by Col. Strachey as that of Bulti, which is the mahomedan name, and includes Hasora, Rongdo or Rongyul; Shigar, Skardo or Bulti Proper, Parkuta, Tolti, Khartaksho, Kiris, Khaypalu and Chotbat: and the buddhist Ladak in which we have Spiti, Zangskar, Purik, Suru, Hembaks (Dras;) Ladak proper or Le, Nubra, Jankstee, Rong, Rupshu and Hanle. In this list of Strachey, Lahul, Hungrung and Kunawar are omitted as Indian; whilst Hasora is treated as Bhot.—*Jatham, Ethnology.*

MARZANJOSH —? *Origanum vulgare.*

MAS, MALAY. Gold.

MASAH, AR. HEB. Anointing, a form of installation, which is practised in Europe but seems to have been of Eastern origin, derived perhaps from the Assyrians. The "masah" of the Arabs, forms the Hebrew messiah, meaning the anointed one. In Rajputanah "anointing" appears to have been, in all ages the mode of installation. The unguent on this occasion is of sandalwood and atar of roses made into a paste, or very thick ointment, of which a little is placed upon the forehead with the middle finger of the right hand, and then the jewels, the aigrette and necklace, are tied on. Amongst the earliest notices of this ceremonial is that in Genesis xxviii, when Jacob rose up early in the morning, and took the stone that he had put for his pillow, and set it up for a pillar, and poured oil upon the top of it. The brahmans anoint their stone images with oil before bathing, and some anoint them with sweet-scented oil. This practice probably arises out of the customs of the hindoos, and is not necessarily to be referred to their idolatry. Anointing persons, as an act of homage, has been transferred to their idols. There are resemblances betwixt the Jewish and hindu methods of, and times for, anointing. Oil is applied to the crown of the head till it reaches all the limbs, it is called abhyanga which is noticed in Psalm cxxx. iii. 2. "It is like the precious ointment upon the head, that went down to the skirts of his garment." Again we are told in Mark xiv. 3. that there came a woman, having an alabaster box of ointment of spikenard, very precious; and she brake the box, and poured it on his head,—and, pouring sweet-scented oil on the head is common amongst the hindu. At the close of the festival in honour of Durga, the hindu races worship the unmarried daughters of

MASH.

brahmans, and amongst other ceremonies pour sweet-scented oil on their heads. Amongst the hindu, the ceremonial is attended to after sickness, which in Psalm xiv. 7. is mentioned thus: 'thy God hath anointed thee with the oil of gladness.' And hindus, when fasting, or in sickness, or sorrow, abstain from the daily anointing of the body with oil, and again anoint on recovery as in 2 Samuel xii. 20, where 'David arose from the earth, and washed, and anointed himself, and changed his apparel, and came into the house of the Lord, and worshipped.' Bathing, anointing the body with oil, and changing the apparel, are, among the hindus, the first outward signs of coming out of a state of mourning, or sickness.—*Ward Hindoos; Tod's Rajasthan*, Vol. ii. p. 568.

MASALA, properly spices or compounds of spices; also used to mean any compound or substance used in any manufacture or operation. See Massala.

MASALLMA and El Aswad, in mahomedan history called the liars, lived in A.D. 632, in the time of Mahomed. The first was of the tribe of Hanefa, of the Yemama province and a man of consideration. He at first embraced mahomedanism and then for a time set up as a prophet on his own account, as a rival to Mahomed, and near the close of the latter's career. Hereafterwards was slain at Akraha in a battle near Yemama with Khalid ibn Walid, whom Abu Bakr, Mahomed's successor sent against him. He fell by the hands of a Negro slave, named Wahsha, with the same weapon that had despatched Hamza the uncle of Mahomed.

MASAKA, SING. Galls.

MASAUDI, a celebrated Arabian traveller and historian who wrote at the time of the tenth century. He was author of the Kitab Merooj el D'hhab; a Historical Encyclopedia, entitled the Meadows of Gold and Mines of Gems which was translated by Dr. Aloys Sprenger.—*Ind. in 15th Century.* See Masudi.

MASHA, a goldsmith's weight 1-12th part of a tola or 15 grains.

MAS'HAB, also called *Malgin*, a light crooked stick about two feet and a half long, used in Arabia, for guiding camels. The *Mas-hab* is of almond, generally brought from Syria; at the thick end is a kind of crook, formed by cutting off a bit of larger branch from which the stick grows. This crook is afterwards cut into the shape useful to seize a camel's nose-ring; or a horse's bridle. Arabs of all degrees are fond of carrying these sticks.

MASHAD or *Gugaira*, **HIND.** a wooden implement used in burning *sajji* or *barilla*.

MASHAD, a city of *Khorassan*, populous and wealthy, which has been enriched by its trade with *Bokhara* and *Karakul*, See *Karakul*.

MASHAIKH, amongst *mahomedans*, elders, holy persons, heads of religion.

MASHAK, **ARAB.** A leather bucket, leathern bags, for carrying water, used by travellers all over the east.—*Pottinger's Travels Beloochistan and Sind* p. 37.

MASHANEE, **BENG.** *Glycine debilis*.

MASHIEM, a river of *Joypore*.

MASHI, **HIND.** *Antennaria*, *sp.*

MASHI-RANG, **HIND.** deep brown color.

MASHID ALI. This city, according to *Kinncir* was founded by *Alexander the Great*, and was, for a considerable time, called *Alexandria*. It is thirty miles from *Hillah*, and four from *Kufa*, a town founded by the *Khalif Um'r*.—*Mignan's Travels*, p. 112.

MASHAL-CHI, **ARAB. HIND.** A torch bearer, a lamplighter, from *Mashal*, **Ar.** a lamp.

MASHI PUTRI, **TAM.** *Grangea maderas-patana*, *Poir.*

MASH KULJE, **BENG.** *Phaseolus Roxburghii*, *W. and A.* also *Ph. radiatus*.

MASHIO, **HIND.** *Thymus serpyllum*.

MA-SHOAY, **BURM.** of *Moulmein*, *Bigonia stipulata*.—*Roxb.*

MASHRABIYAH. **AR.** A projecting latticed window, made of wood richly carved; *Cairo* was once famous for these, but they are growing out of fashion with young *Egypt*, disappearing before glass and green blinds.—*Burton's Pilgrimage to Meccah*, Vol. I. p. 51.

MASHRU. A mixed fabric of silk and cotton.

MASHUR, **HIND.** *Daphne oleoides*.

MASIBATAT. **AR.** in *Arabic medicine* *Hypnotica*.

MASJID with *mahomedans*, is any place

MASKAT.

of prayer, private or public. From "masjid" is derived the word "mosque;" changed by the *Egyptian Arabs* who pronounce the letter *j* as a hard *g*, so that *jab'l* a mountain, *jam'l* a camel and *masjid* a mosque, become *gab'l*, *gam'l*, *masgid*.—*Pilgrimage to Meccah*, Vol. I. p. 141.

MASJID-I-SULEIMANI BUZURG, See *Luristan*.

MASKAT is built on a slope, rising with a gradual ascent from the sea, where the water nearly washes the bases of the houses. The greater portion of the inhabitants are of a mixed race, the descendants of *Arabs*, *Persians*, *Indians*, *Syrians*, by the way of *Baghdad* and *Basrah*, *Kurds*, *Afghans*, *Beluches*, &c. The *Persians* at *Maskat* are mostly merchants, who deal in *India* *piecgoods*, coffee, *hookahs* or *kaleens*, and *rose-water*. Others, from *Bander-Abbas*, *Lar*, and *Menon*, manufacture *swords* and *matchlocks*, for which there is a great demand in the interior. *Banians* constitute a body of the principal merchants, there are a few *Jews*, who mostly arrived there in 1828, being driven from *Baghdad*, by the cruelties and extortions of the *Pacha Daud*, when nearly the whole of this race were compelled to fly. Some took refuge in *Persia*, while others, in their passage towards *India*, remained here. The same toleration exercised towards all other persuasions is extended to the *Beni Israel*, no badge or mark, as in *Egypt* or *Syria*, being insisted on. The Jewish population of *Maskat* and *Muttrah* were estimated by *Wellsted* at sixty thousand souls: During the first quarter of the 19th century, about four thousand slaves, of both sexes and all ages, were disposed of annually. The *Towayli*, from the *Zanzibar* coast, formed one class: they are known by having their teeth filed, sometimes to a point, and sometimes in notches like those of a saw, also with some perpendicular incisions on either cheek, made with a pen-knife when the children are five or six years of age and the scars which remain denote the tribe to which they belong. The price of a *Towali* was from 40 and 60 dollars. The *Nabi*, another race who come from the interior of *Africa*, are said to be vindictive and treacherous. The *Bedowi* here as in the *Hejaz*, are the only purchasers. The *Galla* brought from *Abyssinia*, were highly valued; they fetch from one hundred to one hundred and fifty dollars; the price of the women being about the same as that of the males, and strength, health, and good temper in the latter, are considered as a set-off against the comeliness of the former. They bring *eunuchs* occasionally from *Darfur*, which fetch from two to

MASSAGETÆ.

three hundred dollars, and are mostly purchased by the Persians. Maskat is often visited by a large grampus, which sailors call the Maskat Tom, and the Arabs Ovey. It sometimes capsizes their boats, and plays, according to the report, other mischievous pranks.—*Wellsted's Travels*, Vol. 1. pp. 13 to 388.

MASKAW. A Penang wood of a light brown colour; specific gravity 1·016. Used for palanquins, carriages, furniture, &c.—*Col. Frith*.

MASK FLOWER. Alonson, *species*.

MASKED HORSE-SHOE BAT. See *Cheiroptera*.

MASLO. Rus. Oil.

MASLUN. HIND. *Saxifraga ligulata*, also *Polygonum bistorta*.

MASNA. HIND. *Pistacia integerrima*.

MASNAD. AR. PÉR. Throne.

MASON, ROYD. S. wrote on the fauna, flora, and minerals of Tenasserim, of British Burmah and Pegu. Lond. 1852, 2 vols. 16to. also author of "Tenasserim" "Burmah." The Natural History of Burmah and Tenasserim has been largely described by Dr. Mason.

MASON WASP, of Ceylon, is the *Peloponcus spinola*, St. Fargcan, one of the Sphegidae. The *Ampulex compressa* which drags about the larvae of cockroaches into which it has implanted its eggs, belongs to the same family.

The male of the mason wasp of India, is about 1½ inch long, of a bright brown yellow. The female is about ¼ of an inch long, of a bright bottle green. The male makes a round house of mud, in compartments, into each of which the female drops a few eggs and the male thrusts in large green caterpillars for the subsistence of the young.—*Tennant. History of Ceylon*.

MASR. The old citadel of Masr, in Niebuhr's time, was inhabited by none but christians. In it are to be seen several churches of the Greeks and Copts, with a convent of monks, of the latter nation. A grotto under one of the Coptic churches, is regarded with high veneration, because it is supposed to have been the retreat of the Holy Family, when they fled into Egypt. The Greeks have a church famous for a reputed miracle of a singular nature. Fools recover their wits, upon being bound to a certain pillar of it.—*Niebuhr's Travels*, Vol. I. p. 64.

MASSAGA. See Kafir.

MASSAGETÆ. According to Strabo (lib. xi). all the tribes east of the Caspian were called Scythic. The Dahæ were next the sea; the Massa-getæ and Sacæ more

MASSON.

eastward, but every tribe had a particular name. All were nomadic; but, of these nomads, the best known are the Asi, the Pasiari, Tachari, Saccarandi, who took Bactria from the Greeks. The Sacæ made irruptions into Asia, similar to those of the Cimmerians, and possessed themselves of Bactria and the best district of Armenia called after them Sacæ-senæ. Of the first migrations into India of the Indu-Scythic Gete, Takshak, and Asi, that of Sehesnag from Sehesnagdes (Takshak from Techarist'han) six centuries before Christ, is the first noticed by the Paranas. About the same period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia, and not long after the Asi and Tachari overturned the Greek kingdom of Bactria. The Romans felt the power of the Asi, the Catti and Cimbri from the Baltic shore, Colonel Tod (Vol. I. p. 49,) supposes the Asi and Tachari to be the Aswa and Takshac or Toorshka races of the Poorans of Sacadwipa; the Dahæ to be the Dahya, now extinct, one of the 36 Royal Rajput tribes, and he supposes them to be the descendants of Baldeva and Yudishtra, returned under different appellations. The country on the east is still occupied by the Turkoman race. Herodotus (*Her. Clío*. I. c 216) mentions that they were said to eat their aged relatives; when any one was far advanced in years they called together their immediate friends and neighbours, and having sacrificed him, made a common feast upon his dead body.—*Chalfield Hindoostan*, p. 181. *Herod lib*. I, sect cxxvi. See Gete, Hindoo, Jat, Kafir, Kedah.

MASS. PERS. Diamond.

MASSALA, GARM, or warm spices, include pepper; cloves, cardamoms; cummin and cubebs: the "thauda" or cold spices, comprise chillies, onions, garlic, ginger; turmeric; coriander and cummin seed, tamarind, &c. See Masalah.

MASSANAH. See Kol; Koli.

MASSANDARI. BENG. *Callicarpa lanata*.

MASSEH ISLANDS. These islands situated in the bay of Tajorah, near Arabia, were purchased by the British in 1840, but never occupied.—*Horsburgh*.

MASSICOT. An oxide of lead, prepared from the dross of the melted metal. It is of a pale yellow colour, and is used as a pigment.—*Waterston* quoted by *Faulkner*.

MASSLO KOROWE. Rus. Butter.

MASSON, Charles, a celebrated traveller and numismatologist, left India in 1842. Author of *Journeys in Beloochistan, Affghanistan and the Punjab*.—Lond 1842, 3 vols. Notice of the countries west of the

MAST.

Indus.—Bom. Geo. Trans. 1836-1838; Bombay reprint vol. i. 2.—*Dr. Buist.*

MASSOWAH. A harbour on the west coast of the Red Sea. Eight or ten of the largest ships with double the number of smaller ones could be securely moored in the harbour. There is also a good harbour called Daba-leah, larger than Massowah, about a mile to the north. In both of these the water is quite smooth. The fresh water supply is from tanks in the island of Massowah. There is fresh water also at Daba-leah. Fresh water is not abundant either here or in any other part of the Red Sea, but the supply at Massowah could probably be increased by digging wells on the mainland. There is a pier with facilities for landing on Massowah island which is connected with the main land by low wet ground about a mile in length. The rainy season is from November to March. It is 380 miles from Aden and 290 from Perim. The navigation for the greater part of the way is clear and safe, and for the whole way in the day time for carefully navigated ships. There is no other spot but Massowah and its immediate neighbourhood where ships could lie safely for any time, and where troops and munitions of war could be disembarked with celerity and safety.—*Lieut. Col. H. James, R. N., in Par. Paper.*

MASSOY BARK. ENG. Cinnamomum xanthoneuron.

MASTIK.

warm weather equally grateful and salubrious.—*Ouseley's Travels*, Vol. I. p. 268.

MASTAKA, also Chinna Mastaka, in hindu idolatry, is a form of Parvati as Kali, and, possibly, is the sacti of Siva, in the form of Kapali. She is described as a naked woman with a necklace of skulls, Her head is almost covered from her body, and her blood is spouting into her mouth. In two of her hands she holds a sword and a skull. In a note in Mr. Ward's work on the Hindoos, it is stated that this goddess was so insatiable of blood, that not being able at one time to obtain enough of that of giants, she cut her own throat to supply herself therewith. Ward derives the name from Chinna, cut off, and mastaka a head.—*Cole. Myth. Hind.*, p. 94. *Ward's Hindoos.* See Kerari.

MASTAKANAGRAHA or Mastan, URIA. A brahman of Orissa following agriculture.

MASTARU. Artemisia indica.

Mastic resin is produced in Socio, from the Pistacia lentiscus, the mastic or lentish tree. The process of collecting is in most respects similar to that employed in obtaining the other resins. That which collects on the branches of the trees is called mastic in the tear, and fetches the highest price, while that which falls to the ground constitutes the common mastic. Mastic varnish is well known from its transparency, and other valuable properties; one of which is its peculiar toughness and tenacity even when spread in the thinnest coat, on wood or on canvas. This is due to the presence of a peculiar resin, which does not possess any acid properties, and which has a composition C. 40 H. 31 O. 2,—the acid resin of mastic containing four equivalents of oxygen. It is imported into India from the Persian Gulf also from Kabul, and is used by the natives as an astringent in diarrhea, which property it owes to the volatile oil contained in it; 'also in all diseases depending on an undue accumulation of phlegm.' Price 1 sh. per lb.—*McCulloch's Commercial Dictionary*, p. 796. See Mastic.

MASTIGA. MALAY. Carbuncle.

MASTURAT, AR. 'women, relating to women.

MASUDI, author of *meadows of Gold*, He met Abu Zaid at Basra, A. D. 916, (A. H. 303.) Masudi mentions that, at the time of the mahomedan conquest, the country about Basrah was called Arz-ul-Hind, "The Land of India." The Meadows of Gold treats of all things in nature and History, and of all at once rather than all in succession; of China among the rest. He travelled far and wide, and from a very early age, visiting Sind in A. D. 912 when quite a youth, and afterwards, according to his own account, Zanzibar and the Island of Kaubalu, Champa, China and the country of Zabaj, besides travelling a long way into Turkestan. He mentions that in his time, A. H. 332, offices in India were hereditary.—*Prairies d'Or*, iv. 225 quoted in *Yule Cathay*, i. pp. cx, ccxlii. See Masaudi.

MASUFIL. — *Carthamus tinctoria*.

MASULA BOAT, a boat used on the Madras coast, for crossing the surf. The planks are sewed together and the boat has no thwarts. They are used in landing and discharging cargoes, and carrying passengers to and from ships in the roads. They are sometimes broken to pieces from the heavy surf, which, at times, runs as high as from six to ten feet. A catamaran can be kept in attendance, as a life preserver, in the event of any accident to the masula-boat, by upsetting or in case of any of the Europeans being washed out by the surf. The masula-boats receive their cargoes and passengers from the ships outside the surf. They are rowed by twelve men, with bamboo or casuarina paddles; that is, a board about ten inches broad and fourteen inches long, fixed at the end of a bamboo or young casuarina tree. They are steered by one or two tindals (coxwains) and two men are constantly kept to bale out the water; from which employment they are promoted to the paddle, or bow-oar; after which they fall aft,

MATA-GLAP.

in rotation, to be a tindal or steersman. The steersman gives time by a song, which is sung by all the boatmen; and according as its modulations are slow or quick, the oars are plied. These modulations are regulated by the waves, as they may be slow or rapid, in succession, on one occasion, when a passenger of rank showed impatience at this noisy song, the boatmen were desired to cease; but the steersman refused compliance with the order, saying, that without his song he would not be answerable for the safety of the passenger. The dimensions of the masula-boat are from thirty to thirty-five feet in length, ten to eleven feet in breadth, and seven to eight feet in depth.—*Note by Sir J. Malcolm. Edye, Orme.*

MASULIPATAM, in lat. 60° 9' N. long. 81° 10' E. a large town on the Coromandel Coast. The Masulipatam tract of country lying between the Hyderabad country and the sea, has a population of 520,866 and the collectorate formerly took its name from the chief town in the district which is now designated the Kistnah district. Ellore is another large town. Masulipatam is supposed to be the ancient Mesolia. It was first taken by the British on the 6th April 1759.

MATAR. HIND. Pisum sativum.

MATAR REWARI, HIND. of Amritsar, is the small or field pea, *Pisum arvense*.

MATARE, a town, or rather village, about two leagues from the capital, is seated nearly on the ruins of the ancient Heliopolis. Niebuhr's *Travels*, Vol. I, p. 65.

MATAZOR. HIND. *Phytolacca decandra*.

MAT BAGS are formed of the leaves of the date and other palm trees, and are extensively used in Bombay and many parts of India for packing goods. They are imported into Bombay from Sommeceane and the Persian Gulf.—*Faulkner*.

MATCH COTTE. TAM. See Ballar.

MATCH'HI, also Match'hli. HIND. Fish. **MATCHLOCKS** of a peculiar make are manufactured in the Shorapore district, as also jumbea, knives, daggers, &c., &c. The prices of these would be according to commission, and the amount of inlaid work, silver or gold, which, if employed at all, might be required: the price of a good matchlock without ornament is from 10 to 12 Rupees. A superior matchlock is made at Koteli; the barrel is filed smooth on the outer surface and being carefully cleansed from grease by scouring with wood ashes, is set upright in a hollow cylinder of brass, which is filled with a solution of white vitriol in water. The cylinder is placed upon a slow fire, and in two days, the veins of the damask are developed in high relief. Nothing can be imagined more elegant than the twisted damask of Koteli. It surpasses that of Herat. The straight damask being less tenacious than the twisted variety, should be made of greater solidity. Neither can be compared for effective strength with the gun barrels forged according to the English process, in which the barrel being formed, is twisted at welding heat upon the mandril. But, there is no doubt that the Koteli barrels are superior in strength as well as in beauty to ordinary matchlock barrels; for the whole of the metal becomes consolidated, and rendered fibrous by the intimate twisting of its several parts. The worst feature in the process is the want of care in the construction and finish of the inner surface. The rude measures employed are quite insufficient to assure us that the lips of the rib-

MATCHLOCKS.

band have met in every part, or that the square bits turned with no velocity by the hand have effaced those irregularities of surface which endanger the life in loading. The bore, not being a true cylinder, and the ball being seldom wrapped in cloth or leather, it is impossible that the piece should carry with precision, or that with any given charge, it should range so far as a fuzil of the same calibre. Matchlocks are almost universally constructed with an oviform chamber, which is harmless enough with the weak gunpowder of the bazaars, but dangerous when English gunpowder is employed. It no doubt economises the charge. The barrel is made to swell abruptly at the breach to accord with the shape of the chamber. The matchlock of Herat is generally rifled, a process unknown at Koteli, where, however, flint and detonator locks are made superior to those of most Indian fabrics. The rifling process is very rudely contrived at Herat. In a cylinder of hard wood corresponding in length with a gun barrel, two parallel and spiral grooves are rudely chiselled; a collar of wood is formed in an upright post, opposite to another post, into which the barrel is to be jammed, and within this collar are two short iron pegs, fitting into the grooves of the cylinder. A boring rod is then firmly attached to the cylinder, the cylinder, forming both handle and guide. The boring bit is a cylindric rod rather thicker toward the extremity than elsewhere. Its thickest portion exactly fits the muzzle of the piece. It has a groove at the extremity, into which fits a small sharp wedge of hardened steel. When first inserted into the barrel, this wedge scarcely projects above the surface of the boring rod. It is now introduced into the muzzle, and the wooden cylinder is pushed forward by the workman who leans his weight against it. Of course as it enters the barrel, the spiral grooves of the wooden cylinder being guided by the fixed pegs in the collar give the rod and bit a corresponding spiral motion by which a spiral scratch is made in the interior of the barrel. The wedge is then slightly heightened and the scratch is thus deepened, until the workman considers it sufficient. This process is repeated until six or seven grooves have been formed. The Herat rifle being carefully loaded with balls wrapped in leather or cloth is tolerably true. All the beauty and advantage of the Koteli manufacture are attainable without any of the defects attending the rude treatment of the material in an Indian smithy. That is to say, the solidity and the fibrous consistency given to the iron, and the elegant damascene upon the barrels

MAT'H.

may consist with a perfect inner surface of the cylinder. But such barrels could not, safely, be made so light as the British twisted barrel, a consideration of little moment as regards rifles in which weight is essential to steadiness. The price of the best Koteli barrel without ornament, is about 15 rupees, or 30 shillings. The fabric is generally considered the best in India.

MATELOTA ISLANDS are the most western of the extensive chain of islands called Carolinas, which stretch nearly east through the middle of the Pacific Ocean chiefly betwixt the parallels of lat. 7° to 10° North.—*Horsburgh*. See Yap or Unawh.

MATE-YERBA, Paraguay Tea. The leaves of an evergreen shrubby plant (*Ilex Paraguensis*), largely consumed, in the manner of tea, in many parts of South America, where they are the subject of extensive commerce. The manner of using it is as follows: a pinch of the leaves is put into a small cup of warm water, and the infusion is imbibed through a little tube pierced with small holes; in the lower part, which only allows the passage of the water, and keeps back the leaves. The same leaves serve for three infusions. It is drunk by some with sugar or lemon-juice, and is used at all times. The plant might be introduced into India.

MATH. HIND. of Kuhat a quality of a marsh land.

MAT'H, Ast'hol or Akora, are the residences of the monastic communities of the hindus, and are scattered over the whole of India. They generally comprehend a set of huts or chambers for the mahant or superior, and his permanent pupils; a temple sacred to the deity whom they worship, or the samadh or shrine of the founder of the sect, or some eminent teacher, and a Dharmasala, one or more sheds or buildings for the accommodation of the mendicants or travellers, who are constantly visiting the Mat'h. Most Mat'h have endowments of land, generally of small extent, but as the Mat'h are numerous, the quantity of land in a district pertaining to a Mat'h, is extensive. But, besides lands, they receive presents from lay votaries, ask alms daily in their neighbourhoods, and sometimes traffic. The Mat'hs of various districts look up to some of their own order as chief, and under the presence of this chief mahant, on the demise of any of their brethren, they elect a successor from amongst the chela or disciples, the new mahant being regularly installed at the hands of the president of the assembly, by investment with the cap, the rosary, the

MAT'HA-DI-PADI.

frontal mark or tika or other monastic insignia. In those matters, the British Government never interfere. Amongst the hindus, there is a lay and a priesthood class, the latter being sometimes monastic, and sometimes secular, and the vaishnava sect leave this a matter of choice. The Vallabha Chari sect, indeed give the preference to married teachers and all their Gosain are men of business and family, the preference, however, is usually assigned to teachers of an ascetic or cœnobitic life. The cœnobitic members of the different communities, at one period or other of their lives, have pursued an erratic mendicant life, travelling over India singly or in bodies, subsisting by alms, or merchandise, or some of them, as must be the case amongst such large bodies of men, by less unexceptionable means, like the Sarabaites of the East, or the mendicant friars of the Latin Church. The preference, indeed, is usually assigned to teachers leading an ascetic life. The doctrine that introduced similar unsocial institutions into the christian church, in the fourth century, is still most triumphantly prevalent in the east, the land of its nativity. Monastic establishments and solitary mortification originated in the specious appearance and pompous sound of that maxim of the ancient philosophy that in order to the attainment of true felicity and communion with God, it was necessary that the soul should be separated from the body here below, and that the body was to be uncerated and mortified for that purpose. The Mat'h is under the entire control of a mahant or superior, with a certain number of resident chela or disciples, with a large number of vagrant or out-members.—*Professor Wilson in As. Soc. Proceedings*. See Jain, Jogi or Yogi, Brahma or Madhavachari.

MAT'HA, HIND. ? A tree of Chota Nagpore, with a hard, white timber.—*Cal. Cat. Ex.* 1862.

MAT'HA, or mother, is a term applied only to the sakti of the god Siva. It is said that Mylitta of the Babylonians, a name of Succoth-Benoth, also means, mother. The wife of Siva is also called Vali or Bali, under which appellation she assumed the form of a girl twelve years of age. In Madura, at Balane and other places, virgins used to go to the temple once in their lives to offer themselves in honour of the goddess. The story was that a god had intercourse with them. In all the temples of Siva and his consort, women are kept to dance and sing before the idols.—*Roberts, Or. Ill.* p. ix. See Mata.

Mats are formed of rushes, of the bark of trees, and of the leaves of different species of palm trees, interwoven. Mats are made in all countries. In Russia, a kind termed bast mats are largely manufactured from the inner bark of the lime tree. China mats are in general use in India for covering floors and lining stair-cases, and in India, in places where the bamboo or cane grows readily, mats are made of these materials, as also of

<i>Andropogon muricatum.</i>	<i>Pandanus odoratissimus.</i>
<i>Arundinaria falcata.</i>	„ <i>furcatus.</i>
<i>Arundo donax.</i>	<i>Phoenix dactylifera.</i>
<i>Borassus flabelliformis.</i>	„ <i>sylvestris.</i>
<i>Chamocarpus Ritchiana.</i>	<i>Papyrus pangorei.</i>
<i>Cocos nucifera.</i>	<i>Phrynium dichotomum.</i>
<i>Hedyolum spicatum.</i>	<i>Saccharum sara.</i>
<i>Malococoste pectinata.</i>	<i>Typha angustifolia.</i>
<i>Maranta dichotoma.</i>	„ <i>elephantina.</i>

The leaves of the *Pandanus odoratissimus* make a very fine matting, largely employed by cabinet makers as a packing material. The leaves of the palm tree are also largely used for the palm leaf books. The stalks of *Andropogon muricatum* are used as a thatch grass, and its roots are woven into screen mats called “tatti,” which are wetted to cool the atmosphere.

In Arracan, there are six kinds of Bast, called “Sha” which might successfully be fabricated into mats. In 1854, the price of Russian Mats was £7-10-0 to £8 per 100 wholesale and from 2s. to 3s. 6d. each,

MATS.

retail. The mats of Bengal, called *Sital Patee*, are made from the *Phrynium dichotomum*. Several species of *Typha*, *Juncus* and *Saccharum*, abound in the Madras Presidency and are applied to useful purposes. Many of the mats exported from Calcutta are made from the *Papyrus pangorei*. Some of the Burmese mats are made from the split stems of the *Maranta dichotoma*, called “Then” which grows abundantly in the forests of Burmah and the Tenasserim Provinces. The large coarse mats in universal use in Burmah, are made from the leaf of a species of screw pine, *Pandanus furcatus*? *Burm:* tha-ban: known as the Lowland screw pine in distinction to the “Highland” species of *Pandanus*, which grows on the high lands above tide waters, from which the smaller and finer mats are fabricated. Table mats are made by the Chinese very beautifully and the demand for them has increased the importation of rattans within the last few years. They are exported to all parts of the world. Table mats are put up in sets of six each of different sizes, or else are made and put up to order. Floor mats are made of a rush cultivated for the purpose; the best are called Lientan mats. They are either plain white, or plain red and white. The manufacture of matting for sails of boats and junks employs thousands of workmen; and that for floors, for bedding, and envelopes of boxes and cases, as many more. Floor matting is put up in rolls containing 50 mats of 6 by 4 feet; such a roll is estimated to weigh a peul. The annual exportation to the United States is upwards of 10,000 rolls of 40 yards each, at four dollars a roll. It is also sent to India and South America, Sydney, &c. When matting is shipped, care should be taken that the rolls are perfectly dry, or they will mildew and become rotten. Mats made of rattan for table-furniture, and of grass for floors, are largely exported from China. The latter is manufactured of different widths and patterns, and though the amount annually sent to the United States and elsewhere is calculated to exceed half a million yards, it forms a very small proportion to the home consumption. A sail containing nearly 400 square feet can be obtained for ten dollars. The rolls are largely exported and still more extensively used in the country for covering packages for shipment. A stouter kind made of bamboo splints serves as a material for huts, and many other purposes that are elsewhere attained by boards or canvas. Rattans are also worked into mats, chairs, baskets, and other articles of domestic service. Several branches of manufacture have entirely grown

MATS.

up or been much encouraged by the trade at Canton, among which the preparation of vermilion, beating gold leaf, cutting pearl buttons, weaving and painting fancy window blinds, and the preparation of sweetmeats, are the principal.

The manufacture of mattings from colored grass has long been carried on successfully in the Madras Presidency, and those from Cochin, Palghat, Tinnevely, and Wandiwash, are in considerable demand; the two former on account of their brilliancy of colors, and fine quality, and the two latter from their extreme cheapness. Several species of grass appear to be employed for mats, some being broad, flat and soft, while others are round, fine and wiry; the mats of Cochin, Palghat and the Western Coast are of the latter description, and are more durable in consequence. The chief defect in this manufacture is that the mats have hitherto been made in long strips which required to be sewed together when a large surface of floor is to be covered. This defect was pointed out to the Local Committee of Cochin, who then contributed two large mats 12 feet \times 12 each woven in a single piece of good pattern and harmonious colors. The mats of Tanjore and Tinnevely are creditable.

The plain coir matting of Malabar, and the colored red and black matting of Canara, are known. A door mat made of Aloc fibre in Coimbatore is a novel and useful manufacture, but this substance is well suited to the manufacture of rugs and carpets, as it is cheap, strong and nearly white; and can be dyed of the most brilliant colors and manufactured into cloth, damask, and imitation horse hair cloth. The local names of the mats are

In Palghat ...	Manha Poo Paya.
" Needoongunad	Cooroo Nare Virallee.
Palghat	Anjee Pooketty Mookya Vello
"	Shooyakunden, Virallee.
"	Kella Mooka Virallee.
"	Ketta Mookya Virolla.

Mats are made in the Laccadive Islands, from the cocoanut leaf cut out of the heart of the tree just before it unfolds. These are employed in the islands as sails of ships: they are of fine quality and much esteemed when exported. In the peninsula of India, however, the most common and most generally useful mats are formed of the bamboo, those made with the shining outside strips are used for matting of rooms where the rattan is not procurable. Common bamboo mats are used for lining vessels previous to receiving cargo and for covering bullock carts. Rattan mats are generally preferred for

MATS.

rooms, Tonga mats, similar to the Bengal, are prepared in many parts of Southern India; the date, and palmyra leaf mats are generally used by natives for sleeping on and are very useful; the kildara (Mogali) leaf furnishes a good material for matting for packing, the Mauritius sugar bags are made from it; different grasses and rushes furnish material for common mats, and mat-makers stain the mats both red and black.—Palghat mats and those from Cochin are considered the finest in Southern India. Mats of Travancore are made from the grass *Cyperus textilis*, and another grass called Cooray.

The mats of Silhet are famed, rich hindus sit on mats, and have large pillows at their backs, upon which they rest their arms.

The exports of mats from India were as under, chiefly from Bengal and Madras.

1857-8	£1576	1869-1870	£2379
1858-9	£2505	1870 - 71	£2094

The internal trade in mats is, however, very extensive, as they are in universal use by both Europeans and natives, and are therefore made of kinds and varieties to suit everybody's taste and means. Europeans use only the better kind of mats, and almost exclusively for the covering of floors in their houses, but natives employ them for a variety of other purposes, such as to sleep upon, smoke, &c. Every mahomedan, however poor, after having performed the prescribed ablutions, spreads a small mat before him, while saying his prayers. The hindu uses it as a sort of table-cloth; in many a poor hut it constitutes the only piece of furniture perceptible. The finest kinds of the Bengal matting, are manufactured at Midnapore, near Calcutta. These are only manufactured to special order, but can be made of any size required. The price varies according to the size of the border, which is coloured either red or black, and one large mat, 25 feet square, cost at Midnapore 30£. Smaller mats may be valued in proportion. But besides these extremely fine mats, a description is manufactured, of which considerable numbers are exported to Madras, Bombay, Mauritius, and South Australia, these are much cheaper, and a good strong mat, about 20 feet square, may be had for 4£ if plain, and 5£ 10s. with a black or red border. The mats next in point of fineness are those from Jessore, also in the vicinity of Calcutta, and called Sittalputtee: these, however, are never made, for India, of the size of an entire room-floor, but only in the shape of rugs, and have invariably a red border, sometimes also a red-flowered centre. They are generally made

MATS.

about 4 to 5 feet long and 2 broad, and cost from 2£ to 3£ each. At Hoogly, near Calcutta, an inferior kind of small mat is made, of which very large quantities are exported by the emigrants to Mauritius and Demerara, and lately several shipments have been made to New South Wales. The largest variety of small mats is, however, made in the Madras Presidency; North Arcot, and the whole of the Malabar coast, are celebrated for these handsome fabrics. There are at least 200 varieties of design and colouring, the price varying from 3s. to 3£ per mat, according to quality and length. All mats in India are made by a special caste, who devote themselves exclusively to that description of manufacture. As everybody, high or low, rich or poor, uses some kind of mat, a very large number of people must be employed in making mats to supply the demand, not only of the immense local population, but also that for export.

A kind of mat is made of rushes, which have been exposed to the sun for three days; when about to be used they are soaked in water for an hour, and then split into thin strips. It is made more or less fine, according to the quality of the mat required. If the border of the mat is to be coloured, the rushes are dipped into a red dye to the necessary depth. This process of manufacture consists in plaiting the rushes thus prepared on threads tightly strung between two bamboos, a sley being used, as in weaving, for compressing them tightly together. The finest kind of mats take from one to six months to manufacture, both the time occupied and the cost depending on the size required. Small mats are much used by the natives, but of an inferior and cheaper quality. Mats of this kind are exported largely to Calcutta and they can be made of any pattern, Price up to 300 Rs.

In North Arcot, in 1862, there were sixty-three mat weavers in Wandawash, six of whom are reported to be skilful workmen. The reeds or grass of which their mats are made grow in kasba Wandawash, on a kani of land, which is situated in the vicinity of a tank. They are also largely cultivated in Pallo-Konda, Pondicherry, and Cuddalore in the South Arcot District, on river banks or river poramboke, &c. At Wandawash a kani of land would yield a produce of two bandy-load of grass, if the season be favorable. The price of a bandy-load at Pallikonda is 30 Rs., exclusive of the bandy-hire thence to Wandawash, viz. 7 Rs. or thereabouts. A superior kind of mat grass is to be had at Velani, Tanjore District, but the charges are so heavy that they prohibit import.—*R.*

MATSMAL. See Japan.

MATSYA, the Fish Avatara, of the hindoo god Vishnu, has been demonstrated to have immediate reference to the general deluge, and to be the same history, disguised in oriental fiction, of that event, as is related in the Hebrew scriptures, Sir W. Jones assents to the opinion of Bochart, that the fable of Saturn was raised on the true history of Noah: he shows that the seventh Menu, Satyavrata, corresponds in station and character. In his reign, the Hindus believe the whole earth to have been destroyed by a flood, including all mankind, who had become corrupt, except the pious prince himself, the seven rishi, and their several wives; who, by command of Vishnu, entered a bahitra, or spacious vessel accompanied by pairs of all animals. Vishnu, assuming the form of a fish commanded the ark to be fastened by a cable, formed of a vast serpent, to his stupendous horn secured thereby until the flood subsided; when he and Brahma slew a monster, named Hyagriva, who, while Brahma was reposing at the end of a kalpa, stole the Vedas, and mankind had consequently fallen into the depths of ignorance and impiety. This mighty demon is called the prince of Danava: a name which means horse-necked. The Vedas having been recovered, the world was progressively re-peopled with pious inhabitants, descendants of the devout Satyavrata and his favoured companions. The history of this avatara is the subject of the first Purana, or sacred poem, consisting of 14,000 stanzas, and is concisely told in the eighth book of the Sri Bhagavata, or life of Krishna.—*Sir W. Jones Asiatic Researches, Vol. I.*

MATSYA, a country which produced fish, sometimes said to be Bengal, sometimes Guzerat. The hindu races who worship in addition to the works of their own hands, so many varied products and so large a number of mammals and reptiles do not, seemingly, worship fish. In their religion, the Matsya Avatara is the Fish Incarnation of Vishnu, in which he preserves a king named Manu, with the seeds of all things in an ark, during the deluge, which happened in order to kill Somukasura who had stolen the Vedas, and hidden them in the Sea. A tank or pond

MATULUNGA.

with all its contents may however with the hindus be devoted to a deity, and Col. Tod mentions that when one day he had thrown his net into a lake, which abounded with a variety of fish, his pastime was interrupted by a message from the regent, Zalim Sing, to tell Captain Tod that Kotah and all around it were at his disposal; but these fish belong to Kaniya. On which, Colonel Tod immediately desisted, and the fish were returned to the safeguard of the deity. In such a sacred tank, fish will feed from the hand; and in the Mahamaddy, where it is three miles broad, he tells us, fish will follow for miles for a little burnt rice.—*Tod's Travels*, p. 9.

MATTAL SHAGGA. HIND. of Swat; mica paste for glistening plaster.

MATTAKARULU. TEL. var. of *Oryza sativa*, L.

MATTANDA. The most impressive and the grandest ruins in Kashmir, are Mattand, about three miles east of Islamabad. This temple has been the subject of much controversy in respect of its age and dedication, but General Cunningham believes that the dedication was to the sun, Matau being but a corruption of the Sanskrit, Marttand or the sun, mention is made of it in the Raja Tarangini, translated by Mr. Troyer, "Il construisit aussi dans le village Sulharotsik un sanctuaire au soleil, lequel sous le nom de Ranapurawami, acquit une renommée répandue partout." M. Troyer, however, expressly declares in his translation, that the temple was dedicated to the sun; General Cunningham believes that two different edifices were indicated in the above verse, first, the temple of Ranapurawami, dedicated to Siva; and second, the temple of Marttand, mentioned by the Raja Tarangini as that surrounded by a colomade.

MAUHARI.

MATURA on the east coast of Ceylon, in lat. 5° 58' N. long. 80° 37' E is a considerable town with a fort.

Many gems have been, from ancient times, exported from Ceylon, where the ruby, amethyst, topaz, sapphire, spinelle, chrysoberyl, cornudum and cinnamon stone are found in great abundance, but not emeralds. The sapphires which are red, purple, yellow, blue, white, and star-stone, are met with at Matura and Saffragam, and rubies and sapphires at Badulla and Saffragam. The white Tourmalin, or Maturse Diamond, called in Singhalese, Suda Turmalin, is a topaz of a pale yellow colour.

The Zareon family is richer in Ceylon than in any other part of the world. It is found in the districts of Matura and Saffragam; and is most abundant in the former. "Matura-diamond" is the name applied to its finest varieties by the dealers in gems. Besides the two well-established species, common zareon, and hyacinth, there is a third, massive, opaque, and uncrystallized, and of a dark brown colour. Specimens of it from Saffragam weigh two or three ounces. The yellow varieties are sold by the natives as a peculiar kind of topaz, tho green as tourmalines, the hyacinth red, as inferior rubies, and the very light grey, as imperfect diamonds. All the varieties are found in the beds of rivers, or in alluvial ground, which, both in Saffragam and Matura is of the same kind.—*Horsburgh's Thunberg's Travels*, Vol. IV. p. 219.

MATURA TEA TREE. *Cassia auriculata* Linn. Roob.

MATRISHWA. SANS. Wind.

MAT-WAN-LIN. A Chinese account of India, translated from the Wan-hen-t-hung-Kao, or deep researches into ancient documents.

MATY, in the Madras Presidency, a house servant who cleans up: supposed to be from the English Mate, or from the Malayalam Metti, an inferior servant, an under servant who cleans dishes, shoes, &c.

MATYAR. HIND. Rohi of Punjab.

MAUD. HIND. *Elensine cornana*, Gert.

MAUDEKEE. MALAY. *Crembita citrullus*.

MAUGES, B. C. 135, is supposed to have been a Scythian, the head of one of the tribes that broke into Bactria between 150 to 140 B. C. and he seems to have held communication with Azes. The obverse of his coin contains the king with a trident, a Tartar war weapon, setting his foot on a prostrate enemy.

MAUHARI. HIND. species of *Solanum*. Bari Mauhari is *S. sanctum*, and Choti

MAUND.

Manhari is *S. xanthocarpum*.

MAUL. HIND. *Pyrus kumaonensis*.

MAULABKER. ARAB. Nitric acid.

MAULMAIN. A town in the Amherst province of British Burmah. It is built on the left bank of the Maulmain river around the base of a hill, and the houses of Europeans are on the slopes and summits of the hill. From the top of the hill, on which are several buddhist pagodas, the eye ranges over a grand prospect, - the Gwyne, the Salwyn and the Maulmain river lie below. The Maulmain river has a ridge of rock running across its mouth, endangering navigation.

MAULSARI. HIND. *Mimusops elengi*.

MAULVI, HIND. A learned mahomedan, a doctor of law or literature; &c.

MAUMEA ASIATICA. LINN. Syn. of *Barringtonia speciosa*. *Linna.*

MAUN BHOW, a sect formed by Krishna Bhat. They inculcate the sacredness of the Vedas, but deny that of the Puranas and Gita. The sect are hindu mendicant devotees, who worship Krishna. They are readily recognised by their black clothing. Brahmins assert that the first of the Maun Bhow was the son of a brahman by a Mang woman, but the sect claim a fabulously far descent from the beginning of the world. Their chief locality is in the country between the Syhadri hills, and the east Goud country on the east of Berar, and between the Kistna river and Malwa. A few are to be found in the Panjab. They dwell in mat'hs, the chief mat'h being at Radpur near Ellichpur, Oomarkher. They resemble in their relations, some of the Christian monks. They are believers in Krishna, as his life is detailed in the Bhagwat or eighteenth Purana, and they reject all other hindu shastra and do not worship other hindoo gods. - *Capt. Mackintosh in No. 10, Jan. 1836, M. J. L. & S.*

MAUNBHOOM and Singhbhoom, are districts in Chota Nagpore. The mortality from the famine of 1866 fell on the population about the same as in Orissa.

MAUND, or MAN, a measure of weight of India, which varies from 25 lbs. to 82½ according to the substance weighed. The Bengal Bazaar Maund is 82 lbs. 2 oz. avoirdupois, Goods weighed or passed by viss are converted at the rate of 365 lbs. avoirdupois per 100 viss. Grain shippers declare their own weight. At Ispahan, the shahi or royal man, is always used, instead of the Tabreez man employed at Sheraz. One Shahi man is equal to two Tabreez man. A khurwar or ass's load, is estimated at a hundred man Tabreez, or about 725 lbs. English. - *Fraser's Journey into Khorasan*, p. 369. See Mau.

MAURYA.

MAUNE PGHA, See Karon.

MAUNI. A hindoo ascetic who has taken a vow of perpetual silence, like Paul the silentary. Also the last day of the month of Phalgun, when bathing in silence is to be practised. - *Wilson*.

MAUR, a river running through the Sooree district in Bengal.

MAURA, HIND. *Vitex negundo*.

MAURA BIKH, also *Dudhia maura*, HIND. *Aconitum ferox*.

MAURANDIA BARCLAYANA. A very pretty creeper with pink, white and blue flowers, requires a rich soil. *Maurandia semperflorens*, is a very elegant climbing plant with dark blue and white, also purple coloured flowers, both these are well adapted for trellis work and are easily grown from seed, the plants thrive well in a good soil, either in pots or on the ground. - *Riddehl. Jaffrey*.

MAURI. HIND. *Ervum lens*. - *Linna.*

MAURI CONWAI, a great reservoir in Mysore.

MAURITA CARANA. The Carana palm; the leaves are used as a thatch for houses. - *Seemou*.

MAURITIUS or Isle of France, an island about 300 miles west of Rodrigues, it is mountainous. It extends in a N. E. and S. W. direction, its south-west point being in lat. 20° 28' S. and long. 57° 17½' E. and the north-east point in lat. 19° 53' S. long. 57° 36' E. - *Honshurgh*.

MAURITIUS IPECACHUANA. *Cynanchum ipecachuana*.

MAUROO a race in the mountain country in the 26th degree of N. L. and 98° of E. L. between the Gordan Sigon range and the Myange Sgiunne Kha Nam Baom on eastern source of the Irawaddy river.

MAURU, HIND. *Ulmus crosa* also *Quercus dilata*.

MAURYA a dynasty of Magadha, founded by Chandragupta the Sandracottus of the Greeks, but which was swept away in the middle of the 5th century. Chandragupta, was the illegitimate son of the last Nanda by the beautiful, but low caste, Mura, from whom he obtained the designation of Maurya. In the Madra Rakshasa, a Sanskrit drama detailing his elevation, Chandragupta is frequently named Vrishak, a term said to be equivalent to Sudra; and as Nanda himself was the son of a sudra woman, there can be little doubt that the celebrated Maurya family were of sudra extraction. The Gautama were followed by the Maurya, a family consisting of nine princes. The last of the Maurya is stated to have been attacked and slain by the rajah of Kamayun, named Sakaditya, or Lord of the Saka. See

MAYA.

Chandragupta. Magadha. Barhadhratha.

MAUSOLEUM. Most of the mahomedans of India bury their great men under a mausoleum. The mausoleum tomb of Hamayoon, with its white marble dome is a conspicuous object for miles around. It cost 15 lacs of rupees and was erected by his widow Hamida Banu begum, who is also interred near.

MAW-SEED, The greyish blue variety of hoppy seed.

MAXCIS, PORT. Mace.

MAY or **Ruxtangha May,** TAM. *Schleicheria trijuga*.

MAYA, with the hindoos, morally means nothing more than the nothingness of this world; poetically, the inability of man to appreciate the world in which he lives, and philosophically, it is identical with the idealism of Bentley. On Maya or Illusion, Brahma says, in this life, man, as in a dream, finds delight in eating, drinking, and other enjoyments, but as soon as he awakes they yield no longer pleasure, for the joys and pleasures of his life are as unreal as

MAYI.

dreams. By devout abstraction (that is, by meditating on God) man awakes to a knowledge of divine truths, and finds his former enjoyments nothing but illusion. Thus, a supreme eternal Spirit, the Creator of all, pervades all, and will finally destroy all; in fine, all things are Maya which do not proceed from the light of divine knowledge. By the vaishnavi, Laksmi is called Maya, or Ada Maya.—The inextricable difficulties attending the vulgar notion of material substance concerning which

"We know this only, that we nothing know."

induced many of the ancients, and some moderns, to believe that the whole creation was rather an energy than a work, by which the infinite Being, who is present at all times, in all places, exhibits, to the minds of his creatures a set of perceptions like a wonderful picture, or piece of music, always varied, yet always uniform; so that all bodies and their qualities exist, indeed, to every wise and useful purpose, but exist only as they are perceived. This illusive operation of the deity the hindu philosophers call Maya, or Deception.—*Moor, p. 73. Cole, Myth. Hind. p. 389. See Kamm.*

test Mazaffar Jung fell at Cuddapah, during the revolt of the Pathan chiefs, by the arm of the nabob of Kurnool.—*Orme*.

MAY-ZA-LEE, BURM. *Cassia florida*, also *Cassia sumatrana*.

MAZANDERAN, is a province of Persia, lying on the southern shore of the Caspian Sea. It is very mountainous and rich, and the mountains are, with the exception of those in Georgia, the only ores in Persia covered with forests, principally composed of the Azad-Darakht or Persian teak-tree, admirably adapted for ship-building. This fact made Peter the Great and Catherine II. so anxious to obtain possession of Mazanderan, and the neighbouring province of Ghilan; and indeed they were ceded to Peter by treaty at one moment, although he was afterwards obliged to relinquish them. Down to the middle of the nineteenth century, the Russians never ceased their efforts to gain even a small footing in this neighbourhood; and they succeeded in obtaining and fortifying the small island of Ashoumda close to the shore in the neighbourhood of Asterabad. Mazanderan, in pre-historic times, is said to have been conquered by Roostam, who is said to have killed there a number of elephants, an animal now unknown in Persia. The net revenue of Mazanderan are 22,132 tomans 8,740 dinars. Mazanderan, as well as Ghilan, may be divided into two distinct climates, the warm and the cold; namely, the mountainous region, and the flat country along the shore of the Caspian Sea. Winter and spring are the healthiest seasons, for the summer and autumnal heats occasion such exhalations to arise from the fens and marshes which overspread this part of Persia, as to render the air most insalubrious. Agues and dropsies are the prevalent disorders, and the natives have in general a sallow and bloated appearance, indicative of the state of their health. In October, November and December, there are heavy rains. Snow also falls, but never lies long upon the ground; and in spring the rivers, almost invariably overflow. The small province of Asterabad is sometimes included in Mazanderan, which it resembles in appearance, climate and productions. This is the ancient Hyrcania, and the paternal estate of the king of Persia, as chief of the Kajar tribe who have entire possession of the province. It is bounded on the West by the Caspian Sea, to the South it is separated by a lofty ridge of mountains from the districts of Damgan and Bistan; it extends to the East as far as the Longitude of 58°; and is divided from Dahestan by the river Ashor. The city of Asterabad, the "capital of the province, is

MEALY BUG, or White Bug, is the *Pseudococcus adonidum*. The male insect is of a dirty brownish color and slightly hairy. It is very minute (very much smaller than the females; only about half a line long) and resembles certain small Ephemeridæ or May flies. The female is oval, brownish-purple, covered with a white mealy powder which forms a stiff fringe at the margin and at the extremity of the abdomen two setæ. The larvæ and pupæ are active and move about. The insects in all stages of development, are found in Ceylon, all the year round, chiefly in dry and hot localities, on the branches of trees and on the roots to one foot under ground. Mr. Nietner says it is identical with the species naturalized in the conservatories of Europe. It is preyed upon by the *Seymnus rotundatus*, a minute beetle of the Lady bird tribe, of the size of a pin's head, black and pubescent. Also the yellow colored and common *Eucyrtus Nietneri* and the black colored scarce *Chartococcus musciformis*, two minute Hymenoptera (wasps), only $\frac{1}{2}$ " long and the minute whitish mite *Acarus translucens*. Of the members of this family of insects, the Coccidæ, some, as the Cochineal and Lac insects, are of great economical importance; but others as the sugar-cane blight of the Mauritius, the *Aspidiotus*, and the Coffee

MEASURES.

bug, are excessively baneful to the gardener and agriculturist. — *Nietner*.

MEANGIS or MENANGUS, a group of islands on the S. coast of Mindanao, in about lat 5° N. long. $127^{\circ} 45'$ E. They are three islands of moderate size, with some smaller ones adjoining, they lie about 36 or 42 miles N. E. of the Talour Islands. Sangir and the numerous islands of this group, in the Celebes, occupy a superficies of 13 square leagues, the Tolaut and the Meangis islands united are 18 square leagues; these archipelagoes, formerly subject to the authority of the sultans of Ternate, now make part of the larger Dutch residency of Menado. Several extinct volcanoes, and some still in full action, are found in the Sangir group; the devastations which they commit from time to time, have often been fatal to the inhabitants. The eruption of Duwana, in 1808, completely annihilated the village of Tagulando, destroyed all the surrounding forests, and suddenly deprived the inhabitants of all means of livelihood, by the destruction of their fields. The Gunong-api causes numerous ravages in the island of Sjauw; its peak, 6000 feet above the level of the sea, forms the culminating point of this group. Gunong-api covers with its base all the northern part of Sangir-besar. This volcano has not been active since 1812 when torrents of lava from it destroyed the extensive forests of cocoanut trees with which this part of the island was covered, and caused the death of many of the inhabitants. These islands furnish more than twenty-five kinds of wood suited for building and furniture. Two harbours, sheltered from all winds, exist in the larger Sangir, one in the Bay of Taruan, the other, called Midelu, on the eastern side. — *Journ. Ind. Arch. for Dec, 1850, p. 764.* — *Horsburgh*.

MEAN KHEIL TRIBE, on the Punjab frontier is partly Afghan, partly Bakhtiari.

MEAR, *CAN. Caryota urens*. — *Lin.*

MEASURES. Amongst the natives of India, from the elbow to the tip of the middle-finger is reckoned a hat'h or kovil (cubit) of eighteen inches; this is the usual measure for articles of ordinary value, the itinerant vendors of which have frequently no other standard. Hat'h means hand, also cubit. The Greeks and Romans measured by the foot (pes) the hand (palma) the palm (*παιλαστη*) and the finger (digitus) which mode passed down to the Romano-Germanic races. The Romans had the pace, a military measure and they and the Greeks had the cubit, (cubitus) from the point of the elbow to the point of the middle finger and the ulna: fathom, tesa, toise is the bam or

MEASURES.

outstretched arms across the body. The ell, or cubit, from the elbow to the end of the finger was the unit measure of Egypt, of the Jew, and of Babylon.

By a Proclamation of the Governor of Madras in Council, October 16, 1846, after the 1st of January 1847, the undermentioned Weights and Measures could be used in the Revenue, Commissariat and other Public Departments throughout the Madras Presidency.

MEASURES.

Mr. W. H. Bayley of the Madras Civil Service, when a Member of the Board of Revenue, in 1857, in a memorandum on the land measures of the Madras Presidency, remarked that the 'Linear' measure of India, is almost everywhere founded on the length of the human fore-arm, called in Hindustani *hath*; in Tamil *moolam*; and in Telugu *moora*. It is said to be the length from the elbow joint to the tip of the finger of some tall man chosen as a standard. The term is translated *cubit*, but it invariably exceeds the 18 inch cubit of England. Major Jervis in his work on Indian Metrology, assumes the Indian cubit at 19.55 English inches; and in the Madras Presidency it averages about 19.7 inches, varying from 19½ to 20. In the southern part of the Presidency the Tamil word *adca*, translated *foot*, is known as a linear measure; this also is said to be the length of the foot of some tall man, and averages 10½ inches. The ancient linear measures of the Egyptians, and the Jews, and Greeks, were taken from a unit representing the human foot or arm. The "cubit" was, as in India, the forearm, i. e., from the elbow joint to the tip of the long finger. The cubit was sub-divided into two "spans," or six "hand-breadths," (palms) or 24 "finger-breadths" (digits). The Jewish "Rod" was six cubits. Several values, have been assigned to the Jewish cubit, varying from 26 to 21 English inches: so that it assimilated very closely to the Indian cubit.

The *guz* translated *yard*, is known all over India, but perhaps not so extensively as the cubit. It is supposed to have been introduced by the mahomedans, but on what standard founded, is not known. It varies exceedingly in different localities, and in the same place its length sometimes varies with the length of the article measured. The *guz* of Akbar, called the *Ilakhee guz* was introduced by him into Northern India in the 15th century, and was equivalent to 33½ English inches. The British Government however, fixed on 33 inches for the standard *guz* of the North-West Provinces. In Bombay the *guz* is about 27 inches, and in the Madras Presidency varies from 26 to 39 inches. It is, however, very much superseded by the English yard measure. In the districts of Madura and Tinnevely, the *Tutchu-kole* or Artificers' stick is 33 English inches.

In the South of India the *Guz* is sub-divided into 24 *ungoolum*, each of which, taking the Tanjore *guz* of 33½ inches, is 1¼ of an English inch. The term *ungoolum* in

MEASURES.

Tamil signifies the thumb; and in the above measure, it is the distance from the thumb joint to the tip of the nail. This *ungoolum* is considered equal to 2 *virrul kuddei*, or finger-tip-breadths.

The term 'ungoolum' is however sometimes used to mean a thumb-breadth, and is then the same as the *virrul kuddei* or finger-breadth or digit, or the 24th part of a cubit (about .82 inch) according to the following Table,

4 Fingers' breadth	= 1 Palm.
12 Fingers' breadth	= 1 Span.
24 Fingers' breadth	= 1 Cubit.
4 Cubits	= 1 Fathom.

The *Tutchu-moolum* or Artificers' cubit (double) of Trichinopoly is 33 inches, or the same as the Tinnevely *Tutchu-kole*, and is sub-divided into 24 *ungoolum*.

The *bam*, translated *fathom*, in Salem and Coimbatore averages 6 feet 4½ inches, and in Gunttoor 6 feet 6⅝ inches. It is generally, but not always sub-divided into 4 cubits. The *bam* or fathom is also used by Native Seamen, on the lead line.

For distances of greater length, there is no defined measure in Southern India. A *nali-vulli* in Tamil, is derived from *vulli* a road or way, and *nali* a period of time which is the 60th part of the 24 hours, or 24 English minutes, generally known as an "Indian hour." The distance that is usually walked in this time is called a *nali-vulli*, and is about 1½ English miles or somewhat less. Seven *nali-vulli* make a *kadum* of about 10 miles.

The *cors* is generally considered 2 English miles, but according to Colebrooke as follows:

4 Cubits = 1 Danda or Staff.

2,000 Danda = 1 Cors.

Taking the cubit at 19½ inches, the *cors* would be 2.46 miles.

In Southern India, it appears to have been the custom in ancient times to name an area of land after the quantity of grain, that it was thought would sow it, or the quantity it was thought it would produce. Thus, for instance, a candy of land was as much as would produce a Candy of grain, and this was by estimate, and not by actual measurement, or if a measured area was considered a Candy in one village, it would not be so in the next. Even where there is some defined superficial measure, commencing from a rod square, the number of cubits to the rod varies, though the term by which the square rod is known is the same.

In some districts of the Madras Presidency the land-measure is well defined, as in the case of the Cawnie, and the Acre. The

MEASURES.

former no doubt formerly differed in different places, but its dimensions seem to have been determined and introduced by Royajee the celebrated dewan of Mahomed Ali (Wallajah) nawab of the Carnatic. Wherever the Cawnie exists, it is now 57,600 square feet, or 1.322314 acres, except in some of the talooks of Trichinopoly. The English Acre was introduced by Sir T. Munro into Bellary and Cuddapah, during the Survey (so called) of 1802-1806, and 1842 it was introduced on a similar occasion into Kurnool. Unfortunately in both cases the chain of 33 feet was used instead of Gunter's chain of 66 feet, so that the square chain was $\frac{1}{4}$ th acre, thus introducing an awkward sub-multiple, (not more so however than the rood and perch) when a very simple decimal sub-division might have been adopted.

Some confusion has occasionally occurred from the use of the term *cubit* in English correspondence. It is constantly assumed to be the English cubit of 18 inches, and on one occasion a whole series of Tables of Land Measure in a District, which had been officially sent forth as correct, had to be revised and altered throughout, in consequence of this error.

The term *goonta* or *coonta* also is another word which has often given rise to mistake. It is synonymous with *coolee*, and *goolee*. The word seems to denote the land measure next below the maximum of the place; thus the *pooty* of Rajahmundry, the *culty* of Masulipatam, the *coatchel* of Guntoor, the *goorloo* of Nellore, the *cawnie* of Chingleput, the *acre* of Bellary and the *mow* of Tanjore are all sub-divided into *goonta* (*coonta*), or *coolee*, (*goolee*.) The *goonta*, &c., of one district, is not at all necessarily the same as the *goonta*, &c. of another.

Not only is there a perplexing variety in the native Land Measures, but it is well known that the areas are not even what they profess to be, the rod or rope being seldom or ever the number of cubits it is said to be. Considering therefore that in the Madras Presidency, where the Ryotwar system of assessment generally prevails, it is a vital point to have on record the exact size of every field, and a new Survey seems almost indispensable. It will then be a question what kind of Land Measure should be introduced? That of the Cawnie would perhaps be most acceptable to the people, but there would be little difficulty in introducing the English acre. This has already been done in Bellary, Cuddapah and Kurnool, and in a good part of Guntoor. In Salem, though the original measurements were in native *goonta*, and *bullah*, the accounts have long

MEASURES.

been kept in acres, according to Tables of Conversion prepared many years ago, and the extent of each Ryot's holding is stated in his puttah in Acres. In the late Bombay Survey the Acre was introduced, and in the North-West Provinces the areas of the villages are recorded in acres, though the fields were measured in local *beegas*.

An Act was passed by the Governor General of India in Council in October 1871 with a view to provide for the ultimate adoption of a uniform system of weights and measures of capacity throughout British India. The Act directs that the unit of weight shall be a "ser," equal to the French kilogramme, and the unit for measures of capacity, a measure containing one such ser of water at its maximum density, weighed in a vacuum. Other weights and measures of capacity to be authorized under this Act are to be integral multiples or sub-multiples of these units, the sub-divisions to be expressed in decimal parts unless otherwise ordered. When proper standards have been provided for verification of these weights and measures to be used by any Government office, municipal body, or railway company, the Governor-General in Council may direct that the weights and measures so authorized shall be used in dealings by such office, body, or company. The local Government may prepare tables of the equivalents of other weights and measures in terms of the weights and measures so authorized.

Mr. Charles E. Gover of Madras, who has published a valuable book on the Indian weights and measures, remarks that the unit of weight now commonly employed is the tola, which, according to the official regulations upon the subject, should be 180 grains in weight. It is the rupee, and was adopted from its fancied quality of giving everybody the power of testing his own purchases. Nevertheless, in the following localities, the tola thus varies in grains.

Ahmedabad .. 193.44	Konkan .. 186.8	Salsee .. 191.
Ahmednagar .. 188.4	Do .. 188.	Do .. 194.
ger .. 188.4	Do .. 191.6	Sattara .. 172.5
Aurangabad .. 187.6	Madras .. 182.29	Sauksee .. 195.4
Arowlee .. 182.8	Malwa .. 190.	Do .. 184.8
Do .. 191	Malwan .. 186.	Soowarn .. 193.2
Belgaum .. 176.25	Nijampoor .. 180	droog .. 187.2
Bombay .. 184.5	Nujunwell .. 190.6	Surat .. 187.2
(for oil) .. 191	Patna .. 209.	Do .. 178.3
Guzerat .. 183.5	Rajpoo .. 177.5	Sulia .. 178.7
Do .. 175.9	ree .. 177.5	Vijydroog .. 186.6
Gosla .. 178	Rutnagiri .. 186.2	Vingotia .. 186.6
Jaulnah .. 184.5	Do .. 187.8	Do .. 181.3
	Eyguh .. 187.3	Wurad .. 186.
	Do .. 184.8	Do .. 185.6

Next above the tola comes the *seer*, a weight universally employed throughout every corner of India. It is based upon the tola, of which, according to the Bengal new scale,

MEASURES.

it ought to contain eighty. In practice it may be any number of tolas from 24 to 140, and these of any of the hundreds of kinds just described. As if this were not enough, "the seer," in the words of a Government order, "is liable, according to the pernicious system hitherto prevalent, to vary in weight for every article sold as well as for every market." Thus in Bombay, butcher's meat is sold by the seer of 26 tolas; arrack and milk by the seer of 56 tolas, while drugs are sold in seers of 24 tolas, and cotton, in seers of 26. Yet other articles are sold by the seer of 27½ tolas. On one side of the little river that enters the sea at Goa, the seer employed in wholesale dealings is of 28 tolas, while on the other side, it contains no less than 72. In Calcutta, some articles are sold by the seer of 80 sicca rupees, while for others, the seer is 80 current rupees. If we travel through the districts immediately surrounding Calcutta, we shall find in Hooghly, seers of 54, 80 and 82 tolas. In Naddea, 82½ tolas make the seer; in Pubnah, 58 and 60; in Bancorah the grain seer is 98 tolas for merchants, while, retail, it is but 62. In the Beerbhoom bazaars the ordinary seer is 58½ tolas, for one article it is 60, while for the commoner metals it is 72. The planter in Tirhoot when he makes his purchases in the bazaar, cannot tell whether his seer shall be of 48, 52, 76, 80 or 88 tolas, for all are used. At Furruckabad, it may be either 80, 82, 90, 96 or 112 tolas. At Azimgarh, cotton is weighed by the seer of 80 tolas, ghee and salt by the seer of 95, corn in retail transactions by the seer of 96, while in wholesale purchases, the seer contains either 105 or 108 tolas. Behar has a seer weighing either 44, 48, 52, 72, 76, or 78 tolas, effectually preventing any one from making a purchase out of the village in which he was brought up, and whose seers he is acquainted with. Bhagulpore, with an almost endless variety of its own—64, 67, 80, 88, 101 and 104 tolas—has not one to correspond with any one of the Behar measures. The province of Malda, contains seers varying in the following proportions—50, 58, 60, 72, 75, 76, 80, 80½, 91, 92, 94, 96, 100, 101 and 105 tolas. In Calpee, cotton is sold by the seer of 75½ tolas, and rice by measures containing 66 tolas when the transaction is wholesale, while if it be retail, they contain 80 tolas. The full benefits of the irrigation works in Cuttack, can never be obtained, while the seer varies from 26, 40, 52½, 65, 87½ to 150 totals. In Madras the seer for meat is 2½ lbs., for merchandise it is 3½ lbs., while for copper it is but 10 ounces, while that employed by Government is 3 lbs. 1 oz. 5.94 drams.

MEASURES.

Above the seer, and equally universal is the man, maund, or pharr, which in Madras is 25 lbs., in Bombay 28, and in Calcutta, 82½ lbs. The Bombay Mercantile News, in its price current of exports for 21, December 1864, contains the following maunds, in addition to the official maund of 28 lbs., for

Cardamoms ... 37.5 lbs.	Hemp ... 30.8 lbs.
Cotton ... 39.2 "	Mocha Coffee ... 41.06 "
Ginger ... 29.4 "	Munjeet ... 41 "

and besides there is another maund of 29.4 lbs. In Bengal, the factory maund is 74½ lbs. The coasting steamers on the Western coast start from Travancore with maunds of 32 lbs., deal at Calicut in maunds of 30 lbs., but ship coffee that has been sent down from Wynand, in maunds of 25 lbs., but of 28 lbs. if from Mysore. At Cannanore, the maund is 25 lb. At Bombay, the current maund is 28 lbs., into which before shipment all mofussil shipments have to be transferred—if Poona goods, from maunds of 78.8 or 90 lbs.; if Ahmednuggur productions, maunds of 80 or 163½ lbs., must be thus reduced. Sattara shipments must be charged from maunds of 152½ lbs. Perhaps the next port will be Surat, where the maund may be either 31, 33, 39, 41 or 44 lbs. The end of the journey will probably be Kurrachee, were the puzzled supercargo must deal in maunds of 80 or 83½ lbs. At Deesa, the value descends to 40½ lbs., and at Rajcote to 41 lbs.

Measures of length. The popular unit of length is the guz. Everywhere its use is habitual. It will probably be seen that it is not only the unit of length but is intimately connected with the units of weight and capacity.

It may be anything between 15 and 30 inches, but is, in nineteen cases out of twenty, between 18½ and 21 inches. The popular cubit in Beerbhoom is 15½ inches in length, although the Revenue survey employs a cubit of 18½ inches. In the Hooghly district, the cubit varies from 18 to 19½ inches, while in Pubna it may be anything between 17 and 30 inches; at Sarum it is 24 inches in length, while in Broach, Kaira and Veejdroog, it is respectively 19.2, 19.4 and 19.58 inches. The following table will exhibit in a condensed form, a few of the variations:—

	Inches.		Inches.

More important than the cubit and more universal, is the guz of Western and Northern India and the kol of Southern India. Whatever may have been its length originally, it now is as variable as it is possible to conceive. Nor is the confusion of late origin. So early as the reign of the great Akbar, the guz was so infinitely varied a length, that the greatest of all the Moguls ventured upon a reform which might well be imitated in our days. After very considerable enquiry and deliberation, he introduced as the only legal measure, what is called the *Ilahee guz*. The Ayeen Akberry informs us that this official guz was taken as the mean of three chief guz then existing, and around which most of the existing measures might be grouped. The smaller of these we know to have been about 28 inches. The *Ilahee guz* we know to have been between 33 and 34 inches. Mr. Duncan, after prolonged enquiry, estimated it at 33.6 inches, while others have valued it at from 33 to 34.25 inches. Let us take a mean of these and estimate it at 33.75 inches. We then find one extreme to be 28 inches, the mean 33.75 inches, and are therefore entitled to assume that the larger measure was about $33.75 + 5.75$ inches, or above 39.5 inches. The third guz could not have been very different from the *Ilahee guz* or mean of the old measures. Jervis thinks it was exactly 33.5 inches, while other careful writers estimate it as above. There are therefore at present co-existent in the greater part of India four main guz measures, —Akbar's and those he endeavoured to supersede—each with innumerable variations and no acknowledged standard. Jonathan Duncan, one of the best though least known governors that ever ruled in India, employed when engaged in "settling" the North-West provinces, a guz of $33\frac{1}{2}$ inches—the parent of a new brood of variations. In the coast districts of the west, the most common guz is that of about 28 inches. In other parts there is a group whose average is about 39 inches. We thus may divide the guz measures of India into a number of groups round a well defined average. There are in this way groups having 28, 30, $33\frac{1}{2}$ and 39 inches for their centres. Frequently two or more of

MEASURES.

these groups are present in one locality for different transactions. Merchants will buy by the guz of 34 inches, and sell by that of 30, or silk will be measured by one, cloth (cotton or woollen) by another, while carpenters and bricklayers will use each a distinct measure. For instance, cotton cloth in Surat is measured by the guz of 27.8 inches, silk and other valuable stuffs by the guz of 34.7 inches, while the carpenter employs a guz of 27.2 inches. At Jaunpore, the carpenter values his guz at 30 inches, the tailor estimates his at 34 inches, while the cloth seller employs one of 40 inches. The muslin seller at Furrackabad uses a guz of $33\frac{1}{2}$ inches, the cloth-seller one of 34 inches, while the seller of silk for turbans and full dress coats, uses no other than $38\frac{1}{4}$ inches. Similar cases might be adduced in infinite abundance. Wherever the cubit varies, the guz follows, usually in the proportion of 12 to 7, though this is by no means an invariable rule, and its lengths are as under :

Agra	... In. 44	Furrackabad	tissues .. 15 fingers.
Do	...33-25	Do. cloth	...16 do.

The cubit and guz will suffice to prove the imperfection of Indian measures of length, and we therefore turn to square measures, in which the beegah is the most widely-spread standard. It is based upon the guz or cubit, and therefore differs in at least an equal proportion.

Beegah, would seem to imply a de-

MEASURES.

finite area, and must have done so at some period. However that may be, there is no such measure now, the name being applied to any decently large area, varying from an acre to 1,500 square yards.

In Calcutta, the value is said to be 1,600 square yards, while according to a very careful calculation made by Mr. Holwell of Black Hole notoriety and quoted by Major Jervis, the real content should be 1,778 square yards, more than ten per cent. greater than is commonly believed.

In Orissa, to the south of Calcutta, the beegah is 4,840 square yards while in Bahar to the west, it is only 3,025 square yards, In Tirhoot, it may contain amongst other values, any one of the following quantities—3,025, 3,567, 3,600, 4,225, 4,549 and 4,900 square yards. Such a measure, can only be of use to confuse. At Saharunpoor, the beegah contains in one village 824½ square yards; in another 2,317¼ square yards, in a third 2,456½ square yards, while in a fourth it contains 2,756 square yards. In Nuddea, it may contain either 3,400 or 3,025 square cubits. The Bogorali beegah is 1,406½ square yards, while that of Delhi is 3,025, and that at Ghazeepoor contains 2,755½ square yards. At Shahjehanpore it may either be 2,916 or 3,600 square yards, while at Hoshungabad it is 4,865½, and at Benares 3,136 square yards. On the western side of India, the variations are equally numerous. At Broach the beegah contains 2,477, at Surat 2,844, in other parts of Guzerat 2,994, while in the East it contains no less than 4,013 square yards.

Measures of capacity, in the greater part of India, do not exist independent of the measures of weight. The maund and seer measures of capacity, are supposed to represent the equivalents of a maund and seer weight, although it is evident, since no two articles have exactly the same proportionate bulk, that no two measures need correspond. In the absence of suitable standards of capacity almost every article is sold by weight, even ghee, oil and milk. Grain is sold either by weight or measure, but with an understood proportion between them, thus in Madras, the "measure" for paddy is exactly the bulk of a "viss" weight, and is therefore but another example of the use of the equivalent of a weight as a measure of capacity. Where independent measures are employed, they usually follow the same rule as those of length, weight and area, and are of every variety. There are however a few measures of a well ascertained value, which appear to have been arranged in something like order

MEASURES.

around the cubic cubit. An old writer on arithmetic, Bhaskur Acharya, states explicitly that a measure called karika was the cubic cubit or ghunuhustu. Above this was the cube of a double cubit, and ten times the half of this is the garce, a measure well known through all Southern India and formerly universal; so that the garce is 40 karika. The half of the karika is the parah. One-tenth part of the cubic cubit is the mercial. In Western India, there is the candy of 10 cubic cubits. The cube of one-fourth of a cubic cubit is the Pylee. In Southern India, there is the Tumi of four hundredths of the garce, and the Paddacu or one-fifth of the cubic cubit, while in the Telugu districts there is the Pootee of two cubic cubits, and another Tumi one-tenth of one cubit. Turning northwards to Ganjam we find the Burnum, of two cubic cubits, and the Nawty of one-tenth of a cubic cubit, and the Toom of one-fortieth of the same measure.

On the other side of India in Bombay, there is the khundee, exactly corresponding with the garce. The cube of half the side of the garce or the half of the cubic cubit is the parah of the same value as in Southern India, while the cube of one-fourth the side of the parah is the seer. In Malwan the Khundee is greatly altered in value and becomes ten cubic cubits, proving that there is an understood connection between the cubit and measures of capacity; in the same district is the Phura of half the cubic cubit. As an official recognition of the relation between measures of capacity and the cubit, it ought to be mentioned that when the government of Bombay ordered that the measures for salt throughout the Concan should be rendered uniform, it was resolved to employ a Phara of exactly half a cubic cubit, estimated at 19½ inches. Reducing the measures referred to into a table, we find the following:—

Madras Garce	40 cubic cubits.
Malwan Khundee....	10 do.
Pootee or Burnum....	2 do.
Ghunuhustu	1 cubic cubit.
Mercial.....	¼ do.
Toom.....	⅓ do.
Nawty.....	do. do.
Toom	⅓ do.

We see here two kinds of division besides the ordinary one of halves and fourths.

10 mercials = 1 cubic cubit.

10 do. = 1 Khundee.

Cube of ¼ side of cubic cubit=Pylee.

Do. do. Parah=Seer.

If we compare the lengths assigned to the cubit, in different parts of India omitting

MECCA.

one or two of the smallest and plainly diminished cubits, we shall find the average to be from 19.5 to 19.7 inches.—*Bayley. Gover.*

MEBA, BENG. *Anona squamosa.*

MECCA, a city in Arabia, the holy city of the mahomedans. It is situated in a dry and barren tract of country, a full day's journey from the sea port town of Jedda. A few leagues beyond it, near the highlands, abundance of excellent fruits is to be found. In the summer months, the heat at Mecca is excessive; and, to avoid and moderate it as much as possible, the inhabitants carefully shut their windows and water the streets. There have been instances of persons suffocated in the middle of the streets by the burning wind called samoum or samiel. The most magnificent part of the sacred city are the arcades around the square in which the Kaba stands. In the Kaba is one singular relic, which is regarded with extreme veneration. This is the famous black stone, said to have been brought by the angel Gabriel in order to the construction of that edifice. The stone, according to the legend was, at first, of a bright white colour, so as even to dazzle the eyes at the distance of four days journey; but it wept so long, and so abundantly for the sins of mankind that it became at length opaque, and at last absolutely black. This stone, every mahomedan pilgrim must kiss, or at least touch, every time he goes round the Kaba. Neither the stone of Abraham, nor that of Ismael, receive the same honours; pilgrims are not obliged either to visit or to kiss them. The Arabs venerate the Kaba, as having been built by Abraham, and having been his house of prayer. Within the same inclosure is the well of Zamzam, valued for the excellence of its water, and no less for its miraculous origin. Hagar, when banished by her master, set little Ismael down here, while she should find some water to quench his thirst. Another ornament of the Kaba, is a row of metal pillars surrounding it. The mahomedans have such high ideas of the sanctity of Mecca, that they suppose it to extend even to the environs of the city. Its territory is reputed sacred to a certain distance round, which is indicated by marks set for this purpose. The Hajar or black stone has suffered from the iconoclastic principle of mahomedanism, having once narrowly escaped destruction by order of the ruler of Egypt. In these days the metal rim serves as a protection as well as an ornament. The height of the Hajar from the ground, according to Captain Burton's measurement, is four feet nine inches; Ali Bey places it forty-two

MECCA.

inches above the pavement. Its colour is now a deep reddish brown, approaching to black. Every person, it is assumed, should perform the pilgrimage to Mecca who has a beast to ride upon, and who can supply himself with provisions for the journey. Ul Shaffei says, those who have money, if they cannot go, should perform this journey by deputy: Malik thinks all who have strength sufficient should go to Mecca: but Ul Haneefa deems both money and health of body requisite before this duty can be deemed obligatory. On the day of pilgrimage the preacher sits on a camel, because the prophet, during his last pilgrimage being sick, made the tour of the Ca'aba on his camel, and remained on it while he preached. Arafat (recognition,) is so called, because Ibrahim, the patriarch, after the vision in which he was commanded to sacrifice his son Ishmael, wandered about for a day in perplexity, as to whether the order came from God. On the second day, being at Arafat he had a second vision, and he then recognised, *i.e.* arafa, its truth. In Mecca immorality is conspicuous and the pilgrim may often apply to himself the words of Umr-ibn-Ali Rabiha, on his return from Mecca,

I set out in hope of lightening the burden of my sins:
"And returned bringing with me a fresh load of transgressions."

The population of Mecca, is about 18,000. Ali Bey (A. D. 1807) calculates 83,000 pilgrims; Burekhardt (1814,) 70,000. Burton reduced it, in 1853, to 50,000, and in A. D. 1854, owing to political causes, it fell to about 25,000. Of these, at least, 10,000 are Meccans, as every one who can leave the city does so at pilgrimage time. The Arabs have a superstition that the numbers at Arafat cannot be counted. A visit to the Masjid El Nabawi, and the holy spots within it, is technically called "Ziyarat" or Visitation. The visitor, who approaches the Sepulchre as a matter of religious ceremony, is called "Zair," his conductor "Muzawwir," whereas the pilgrim at Mecca becomes a "Haji." The Masjid El Nabawi, or the Prophet's Mosque, is one of the Haramain, or the "two sanctuaries" of El Islam, and is the second of the three most venerable places of worship in the world; the other two being the Masjid El Haram at Meccah (connected with Abraham) and the Masjid El Aksa of Jerusalem (the peculiar place of Solomon). And curious to say mahomedans still have the largest cathedral in the world—St Sophia's at Constantinople. Next to this ranks St. Peters at Rome; thirdly the Jumma Masjid or Cathedral of the old

MECCA.

mahomedan city of Bijapoor in India; the fourth is St. Paul's, London. It is to El Walid the First (A. H. 88) that the Saracenic mosque-architecture mainly owes its present form. As will be seen, he had every advantage of borrowing from Christian, Persian, and even Indian art. From the first he took the dome, from the second the cloister—it might have been naturalised in Arabia before his time—and possibly from the third, the minaret and the prayer-niche. The latter appears to be a peculiarly hindu feature in sacred buildings, intended to contain the idol, and to support the lamps, flowers, and other offerings placed before it. Mecca, has as many as twenty-nine designations, such as Om-el-Kora (Mother of Towns), Balad-el-Amin (Region of the Faithful.) The city is chiefly situated in the wadi of the same name, which is also called Bekka, a narrow sandy valley which runs north and south, but inclines towards the N. W. at the latter extremity of the town. The city, with the exception of three castellated buildings and a few watch-towers, is defenceless. Around are several sandy wadi, which are separated from the desert by a low barren chain of hills from 200 to 500 feet in height, the most elevated part of which is on the eastern side. When compared with other places in the east, Meccah may be considered handsome. The houses are built of stone, usually three stories high, with terraced roofs surrounded by open parapet walls, and having the unusual addition of numerous windows, shaded by lightly formed reed blinds, the aspect is more European than oriental, especially as the streets are very wide, in order to afford the necessary space for an addition of about 100,000 to the permanent inhabitants, who are between 25,000 and 30,000 souls. During the pilgrimage, the town is enlivened by well-stored shops in every quarter, and the city becomes an immense fair, in which coffee, myrrh, incense, and other products of Arabia, are exchanged for the richest and most valuable commodities of Persia, India, and Europe, to the amount of several millions of dollars. The appearance of the city, at other times, is sombre; no trees or gardens cheer the eye, and there are but few khans, baths, serais, or even mosques. There are but few cisterns for collecting rain; the well water is brackish, and during the pilgrimage sweet water becomes an absolute scarcity. At other times the city is chiefly supplied by a conduit coming from the vicinity of Arafat, a distance of six hours journey; this extensive work was constructed by Zebeida, wife of Harun-ur-Rashid.

MECHI.

In the middle part of the valley stands the famous Bait Ullah (House of God), once called al Belkat, which, like the edifice at Medina, is chiefly remarkable for the monument it contains. The ka'bah is so called from its form being nearly a cube, (kaab). It is a massive structure of gray Meccah stone, nearly 44 feet long by 35 feet wide, and from 35 to 40 feet high, with a flat roof, supported by two columns, between which are hundreds of lamps hung in festoons. The ka'bah is encircled by an immense curtain (kessoun) of rich black stuff, on which appears in large Arabic characters the essence of the mahomedan creed, "There is no other deity but God, and Mahomed is the prophet of God; also some prayers worked in gold thread. Beyond these are the mambar (pulpit), El Bab-us-salam, and the building enclosed the well of Zamzam, which, according to tradition, was that found by Hagar when Ismael was perishing from thirst, the spring is so abundant that it supplies a large portion of the consumption of the city. Serving as an upper chamber to this structure is the Makam-us-Shufiah, and opposite to the remaining three sides of the ka'bah are the mukam of the other orthodox sects, viz., the Hanefi, the Hanbali, and Maleki.—*Niebuhr's Travels*, Vol. ii. p. 34-36. *Malcolm's History of Persia*, Vol. ii. p. 335. *Hamilton's Sinai, Hejaz and Soudan*, p. 131. *Burton's pilgrimage to Meccah*, Vol. II. pp. 57, 58, 144, 145, 161, 259. *Burchard's Travels in Arabia*, Vol. I. pp. 242, 243, 194. *Arabia M. S.*, 7504 in the British Museum. *Euphrates and Tigris*, Col. Chesney, Vol. I, p. 602 to 603. See Mahomed, India Kaaba, Kiblah, Kattywar, Wahabi.

MECHI or Meche a race in the N. E. frontier of India who are supposed by Mr. Campbell to be the same as the Bodo of Mr. B. Hodgson. They are Indo-Chinese of the Lohitio or Burmese branch of the Turanian family. Their features bear out this opinion. They are of good size, fair but of a yellow colour, good natured and tolerably industrious, but erratic and indifferent farmers, are addicted to spirits and to smoking opium. They are proof against malaria, and make small temporary clearances in the forest: they are inferior to the Tharu in industrial habits. The Dhimial tribe are smaller than the Mechi, but somewhat similar in appearance with a language that in some degree differs. The Kachari, Naga, Abor, and some other tribes bordering on Assam are supposed to be of the same race as the Mechi. The Mechi form the chief population of the forests and N. E. Doar at the foot of the Sikkim and Bhutan hills,

MECONOPSIS.

and a few have recently settled on the extreme eastern portion of the Nepal Terai. The Mechi language is not written and is apparently of Bengal origin. They never live at elevations higher than from 800 to 1,000 feet above the sea and prefer cultivation in the clearances of the Terai. The Bhootan Mechi are a quiet, inoffensive, weak race; they are precisely the same class as the men inhabiting the British Terai; like them they appear to enjoy perfect immunity from the ill effects of malaria. They are however a finer and less sickly and sallow looking set than the Mechi of the Darjeeling Terai, probably because the Bhootan terai is more healthy and drier than the British terai. They welcome travellers to their villages with unmistakable delight, and seem to take it for granted that having once heard their grievances we should immediately take them under our protection. Cotton was one of their principal crops, but poor, has scarcely any staple, but finer soil for the production of cotton does not exist in India. The Mechi seem to change their cultivation constantly, as would naturally be the case with so much virgin land at their disposal. The Bhootan Mechi do not cultivate more than is necessary to supply their own wants, and to enable them to comply with the demands of their rulers, for any surplus which they produced would merely form an additional temptation to plunder on the part of their Booteah taskmasters. They know they can never be rich nor even improve their position, and they do not therefore attempt it. With magnificent timber all round them, with rivers running direct down to the plains, with a full knowledge that a certain market for their timber is to be found where these rivers join the Teesta and Berhampooter on British Frontier, they dare not even cut a single tree for sale.—*Mr. Campbell*, pp. 50, 140. This is found at Kaghan, in the Sutlej valley between Rampur and Sangnam at an elevation of 10,000 to 12,000 feet, also in Nepal, Choor, Kedarkanta, and Peer Punjal. Flowers blue-purple, showy. The roots

MED.

are reputed to be exceedingly narcotic, but an alcoholic extract of one drachm of the root given to a small dog produced no perceptible effect.—*O'Shaughnessy*, p. 184. *Cleghorn Punjab Report*. *Royle's Illustrations of the Botany of the Himalayas*.

MECONOPSIS NEPALENSIS, a Nepaul plant, is described as being extremely poisonous, especially its roots.—*Eng. Cyc.*

MED, Rus. Honey.

MED or **Medi**, a scythic tribe that colonised the Punjab. General Cunningham says that the Med or Mand are almost certainly the representatives of the Mandrieni who lived near the Mandrus river, to the south of the Oxus, and as their name is found in the Punjab from the beginning of the christian era, downwards, Cunningham concludes that they must have accompanied their neighbours, the Jatii or Jat, on their forced migrations to Ariana and India. In the classical writings, the name is found, as Medi and Mauduevi and in the mahomedan writers as Med and Mand. The tribe may have been transplanted to the banks of the Indus, when the Medo-Persian empire extended that far east; or they may have been pressed south-easterly by intruding Scythians, or have left during the persecution of the Magi, who constituted one of the six tribes of Medes. Admitting that the Jataka of the Mahabarata and the Puranas, represent the Jat, the Madra also mentioned there must be regarded as representing the Med, confirming, thereby the antiquity and synchronisms of these two races on the banks of the Indus. The Med devoted themselves to a pastoral life, repeatedly invaded the territories of the Jat, putting them to great distress and compelling them to cross the river; but subsequently the Jat being accustomed to the use of boats re-crossed and defeated the Med, whose country they plundered. They made up their differences and asked Daryo-dhana, king of Hastinapur to send them a king, and he sent his sister Dassal (Dahsalu) wife of Jaradratha who made Askalandha her capital, perhaps the Uch of later times. After a reign of more than 20 years, Jayadratha was killed on the fatal field of Thanesar, and his widow burned herself on his funeral pile. On the same field the Bharata dynasty was extinguished. The earliest historical notice of the Med race is by Virgil, who calls the Jhelum, Medus Hydaspes. This epithet is explained by a statement of Vibius Sequester which makes the Hydaspes flow past the city of Media. This is the same place as Ptolemy's Euthymedia, which was either on or near the same river and above Bukephala. Also in the Penteringian

MED.

tables, which are not later than A. D. 250, the country on the Hydaspes is called Media. From this evidence, the Medi or Med were in the Punjab as early at least as the time of Virgil, or B. C. 40-30. Shortly thereafter, about B. C. 30-20, the Med seem to have been forced southwards into Sind, where the Jat long resented their intrusion. The Erythræan Periplus mentions that about A. D. 100, the rulers of Minnegara were rival Parthians who were mutually expelling each other. When the mahomedans arrived in Sind, they found the Med or Mand, firmly established there along with their former rivals the Jat. Ibn Haukal describes the Mand of his time, about A. D. 977, as occupying the banks of the Indus from Multan to the sea and to the desert between Makran and Fambal. Masudi who visited India A. D. 915-16, calls them residing in Sind. During the period of the Arab occupation of Sind, Mahomed Kasim is represented as making peace with the Med of Surashtra, sea-farers and pirates, with whom the men of Basra were then at war. In the mahomedan period, Amran the Barmekide governor of Sind directed an expedition against the Med, advancing from several directions and reduced them to great extremities. Nevertheless, in the time of Masudi, the inhabitants of Mansura were obliged continually to protect themselves against Med aggressions. They have remained in this locality ever since, for there can be no doubt but that they are now represented by the Mer of the Aravali Range to the east of the Indus, of Kathiawar to the south, and of Beluchistan to the west. The name of Mer or Mand is still found in many parts of the Punjab, as in Meror of the Bari and Rechna doabs, in Mera, Mandra and Mandanpur of the Sind-Sagar doab and in Mandali of Multan, offering strong evidence that the Med or Mer were the first Indo-Scythic conquerors of, and once the dominant race in, the Punjab. Meris or Moeris, the king of Pattala, who on the approach of Alexander, abandoned his capital and fled to the mountains, was possibly a Mer. The Mer of the Aravalli are but little advanced beyond the tract where the Med, a thousand years ago, were a numerous and thriving population. Their brethren the Mina, can be traced in their original seats to the bank of the Indus, and Mer still reside in Kathywar, the Surashtrian peninsula, which was the nursery of the piratical expeditions, and the Mer, Mena and Med seem identical. Med still exist both to the E. and W. of the Indus, and those on the coast, unable to practice piracy, after the manner of their ancestors, follow

MEDEA.

the occupation of fishermen. To the East, they are found roving on the borders of Sind and Jodhpur, the seats of their occupation during the Arab period, and to the west, they are found in the little port of Makran, from Sanniani to Charbar, divided into the clans of Gazbur, Hormari, Jellarzai, and Chelmarzai. When the mahomedans first appeared in Sind, towards the end of the seventh century, the Zath and Med were the chief population of the country. But the original seat of the Med or Medi, was in the Punjab Proper, from which Mr. Thomas concludes that the original seat of the Jatii or Jat colony was in Sind. The Med of Sind, are now a sea-faring and fishing population on the sea ports of the Mekran coast. *Elliot's Hist. of India*, pp. 515 to 531. See Mekran; Guzbur. Meena Mer, Kelat.

MEDEA, an ancient territory now included in modern Persia. The nations of Iran proper or the Arian stock of languages comprise those of Medea and Persia. It includes the Zend of the Cuneiform inscriptions and the Zend Avesta: the younger Pehlevi of the Sassanians and the Pazend the mother of the present or modern Persian tongue. The Pushtu or language of the Afghans belongs to the same branch. The Iranian languages of India are represented by the Sanscrit and her daughters. The Meds were of six tribes, of whom the Magi was one. This race also were classed as Arian. The Mede had many colonies, Herodotus mentions the Sigynnæ, a colony settled beyond the Danube: Medians are also said by Sallust to have accompanied the expedition of Hercules when he crossed over from Spain into Africa. The Sauromatæ were Median colonists beyond the Tanais or Don, and the Matienoi, Matienes, Kharimatai, and possibly the Mares, were Caucasian

MEDICAGO SATIVA.

colonists from Medea, preserving in their names the national appellation of Mada or Madia. Medea and Babylon, till the 8th century B. C. were tributary provinces of the Assyrian empire.—*Elliot*, p. 525. *Bunsen*. See Babylon, Hindoo, India, Irak, Kirkook, Sakya muni.

MEDIA-BHUMI, most nations have indulged the desire of fixing the source whence they issued, and few spots possess more interest than the elevated Media-Bhoomi, or Central region of Asia, where the Amu, Oxus, or Jihoon, and other rivers, have their rise, and in which both the Soorya and Indu races (Saca) claim the hill of Su-meru as sacred to a great patriarchal ancestor, whence they migrated eastward. The hindus do not make India within the Indus the cradle of their race, but west, amidst the hills of Caucasus, whence the sons of Vaivaswata, or the 'sun-born,' migrated eastward to the Indus and Ganges, and founded their first establishment in Kosntya, the capital of Ayodia, or Oude.—*Tod's Rajasthan*, Vol. I, p. 24. MEDICAGO SATIVA, *Linn.*

Valaiti Jawat of Bombay	Rishka, dureshta, PUSHTU.
Lucerne,	ENG. Ilol, LADAK.

This genus of plants belongs to the Leguminosæ, to the tribe Lotææ, and sub-tribe Trifoliæ. Lucerne grows wild in Kashmir, in Ladak, and in the Pir Panjal range, is found wild in the N. W. Himalaya from 5,000 to 12,000 feet, and is cultivated extensively in Afghanistan, where it is used as fodder for horses, &c. Moorcroft says 'that it is cultivated, also, in Ladak and that fields of it continue to be regularly cut for 50 or 60 years.'

This is the *Medica* of Theophrastus, 'Plant. de Caus.' lib. 2, cap. 20; and the *Medica* of Pliny, lib. 2, cap. 20: also 18, cap. 20. Lucerne is cultivated in the Deccan for feeding horses, also in Guzerat, where it is coming fast into use among the natives as green food for cattle. It is propagated by seed, and may be sown at any season, in beds or rows. It requires much water, and each plant should have five or six inches of space allowed to it. Cultivators generally cut it, as it begins to blossom, when fresh shoots spring up, and by manuring it occasionally a succession of crops is continued in this way for several months.

MEDICINE.

Of the grasses eaten by cattle, Sir A. Burnes mentions that three are cultivated in Cabul, rishka "or *Medicago sativa*, the common lucerne, Shaftal a kind of trefoil, and the Si-burga (three leaves) a clover found to be new to Europe, which from its great yield was named *Trifolium giganteum*. Another plant, the *Melilotus leucantha*, or Bokhara clover, differs much from the *Trifolium giganteum* in its properties, though like it of luxuriant growth. The pig, the cow, the horse, the sheep, and the goat, the most useful creatures to man, are wanted everywhere where men live, and there are seventy-two kinds of food which the pig will eat. Two hundred and sixty-two, the horse. Two hundred and eighty-seven, the sheep. Four hundred and forty-nine, the goat.—*Drs. J. L. Stewart, M. D. and Riddell. Eng. Cyc.*

MEDICINE. The medical art, amongst the natives of the South and east of Asia, has had the knowledge of western Europe added to it, during the sixteenth and up to the nineteenth centuries, and from Europe, to the Pacific Ocean, in Egypt, in Africa, in Turkey and Persia, and in the British, French, Portuguese, Dutch and Spanish East Indies, are many medical schools and numerous European, American and native medical men teaching and practising their professions according to the doctrines of the schools of Europe. Amongst the hindus, the art of medicine has been carefully studied from the most ancient times, and books on the subject have a large circulation. Of these, the Ayur Veda, which is reckoned a portion of the fourth or Atharva Veda, is considered the oldest treatise and the highest standard. It is said to have consisted originally of one hundred sections, each containing one thousand stanzas, but fragments only are now procurable. The works of Charaka and Sasruta, who are said to have lived about the time of Rama, are also regarded as of great authority and Agastya a Tamil writer is fabled to have written upwards of fifty treatises on medicine, alchemy and magic, but some of these attributed to him have been composed after the arrival of Europeans in India and there are upwards of 120 Tamil works on medicine some of them of considerable size. Amongst the hindus of the nineteenth century, medical science is, however, much in the same state as it was in Greece in the time of Hippocrates and the Greeks seem to have derived from India, their systems of philosophy and medicine. Hippocrates and Plato taught that fire, air, earth, and water were the elemental constituents of our bodies. The views which Pythagoras and Plato en-

MEDICINE.

tertained of health and disease, precisely accord with those of Plato and the hindu Susruta and the hindu system of therapeutics is much the same as that of Galen, who taught that the properties of all medicines are derived from their elementary or cardinal qualities, heat, cold, moisture and dryness, and if a disease be hot or cold a medicine with the opposite qualities is to be prescribed. A general belief in the hot and cold inherent qualities of medicines at this day pervades the whole of India, and the most illiterate labourer as well as the most learned Pundit explains the action of medicine on this Galenical principle only; some hindoo medical men are able and trust-worthy but the great mass of the native medical men have not yet been taught the science of Europe, and have not the slightest knowledge of their art. Nevertheless their materia medica, is sufficiently voluminous, and their rules for diagnosis define and distinguish symptoms with great accuracy; they have also paid great attention to regimen and diet, and have a number of works on the food and general treatment suited to the complaint with a variety of works on the medical treatment of diseases, containing much absurdity with much that is of value. Their value of experience and of a thorough education is also proved by many of their proverbs; the mahomedans of Persia and India, tell us nim hakim, khatra-i-ian, with a half educated physician there is a danger to your life, which is the English proverb

A little knowledge is a dangerous thing. A familiar Tamil proverb warns that he only can be a good doctor who has killed ten persons, and a Singhalese proverb is that he who has killed half a thousand is half a doctor. But both the Tamil and Singhalese proverbs simply mean that there is as yet no regular teaching for their physicians who must acquire their knowledge by their own series of successes and failures. The kachabonda is a herbalist. The vidyan is a learned hindu, practising medicine, the hakim of the mahomedans is a learned man and the tabib is a physician. In southern India, the native medical practitioners are either of the Yunani or Grecian school of medicine, or of the Misri or Egyptian. The Misri is sometimes designated the Suryani or Syrian school. Most of the mahomedan physicians are of the Yunani school, and the generality of the hindu physicians follow the Misri school. The Yunani physicians use chiefly vegetable drugs in their treatment of the sick, and with them bleeding is deemed a suitable line of practice. The Misri physicians, on the other hand, chiefly use

MEDICINE.

oxides of metals, sulphur, cinnabar or sulphide of mercury, and orpiment or sulphate of arsenic, but these drugs are first combined, by the action of fire, with some other mineral substance, otherwise they are regarded as noxious. Also, they consider bleeding as never admissible. Every mahomedan gentleman necessarily knows something of the healing art. The medical profession, therefore, ranks next to the clerical in point of respectability; and so highly is the study thought of, that even royalty itself will occasionally condescend to dose its subjects. There are now (1872) in Madras, several men of noble family who regularly give medical advice gratis.

The British Indian Government has established Medical Colleges at Calcutta, Madras, Bombay, and Lahore, and at Bareilly is a medical school for native girls. In the first century, of the christian era, Dioscorides made enquiry into the medicinal virtues of many Indian plants which were then brought to the markets of Europe. In the second century, the great Cornelius Galen published his famous work, the leading opinions in which, as to hot and cold medicines, were borrowed from India, where they still prevail. In the 7th and 8th centuries, natives of India practised as physicians in the Arabian hospitals of Bagdad, employing many valuable Indian drugs in their practice. Under Maman, the Arabian professors of that School obtained, and taught from translations of, the Sanskrit medical shastras of Chararuka and Susruta. Thus in teaching medicine to the hindoos and mahomedans, Europeans are, literally, merely repaying, what, for at least seventeen centuries, they owed to India. The first establishment which English enterprise obtained in India was won by the science, and the noble disinterested patriotism of two British surgeons—Gabriel Broughton who cured Shah Jehan's daughter of a frightful burn, and William Hamilton who cured an ailment of Feroz Shah. On the 10th January 1836, pundit Mudoosoodun Goopta, a medical teacher of the baid or physician caste, began to teach the hindus the study of practical anatomy by dissecting a human body with his own hand. And now, in 1872, about three thousand subjects are dissected annually by 1,200 Native students in the medical colleges of India. Also hindoo gentlemen, who, having passed through a course of study, as complete as any school in Europe can afford, have lately received in the Calcutta University, that high degree of Doctor, which, in Salamanca of old, gave the humblest scholar right of place among the superb Hidalgos

MEDICINAL SUBSTANCES.

of Spain, which, in England, ranks the physician and his brother Doctors Graduate, only a few degrees below nobility. Doctor Chuckerbutty, a native of Bengal, and the first of his nation who achieved the honor of becoming a medical officer in Her Majesty's Indian Army, first projected the Bengal Medical Association. About the year 1840, the plan of a Medical Mission was first recommended for China,—that is, of a christian mission, the main object of which was the conversion of the natives, the missionaries being medical men, securing an introduction through the practice of their profession. The arrangement seemed to be, for China, one of the best that could be conceived, and a similar plan has been adopted in India, in which Christian missionaries practice medicine, whilst instructing in their own doctrines. The Revd. Drs. Scudder, Strachan, Carslaw, Elder, Elmslie, Valentine, Parker, Green, Williams, Chester, Palmer, and Paterson, have taught a pure faith to, and cured the bodily ailments of, the people and their names will long be remembered.—They will do more to christianize Asia, than non-medical missionaries, who, though highly educated, deeply learned in controversial theology, skilled in Hebrew and the Classic languages of Greece and Rome, versed in the history of the Church and its ministers, and familiar with every page of the Bible; take a closet or a student's view of people and of things—a view as remote from reality as possible. But the medical art has given a good introduction to the mission field, and the creation of a favorable impression amongst the objects of their future labours, in the exercise of secular vocation by which the heathen are exalted, civilized, and advantaged. Most of the Natives of India continue shy of calling in the aid of a European doctor; and commonly he is not sent for till the prayers and juggling tricks of the village medical man have utterly failed, and the poor patient on the point of dying of a disease which, if properly treated at the commencement, might easily have been cured. The white doctor is then requested to come, as a last resource; but he comes only, to find that he has been sent for too late to be of any use, and that the patient has been reduced to the last extremity, by a course of treatment, the most absurdly injudicious that could be devised.—*Richard F. Burton's Scinde*, p. 399.

MEDICINAL SUBSTANCES. The medicinal substances employed by the people of Eastern and Southern Asia are very numerous and drugs to the number of ninety are found perfect substitutes for those employed

MEDICINAL SUBSTANCES.

in Europe. The following are the better known:—

Catechu.....	Acacia catechu.
Aconite.....	Aconitum ferox.
Sweet flag.....	Acorus calamus.
Bael fruit.....	Aegle marmelos.
Mutty pal.....	Ailanthus malabaricus.
Aloes.....	Aloes indica.
Galanga root.....	Alpinia galanga.
Chiretta.....	Andrographis paniculata.
Lemon Grass, Citronelle	Andropogon citratus.
Rooea Grass.....	„ calamus aromaticus,
Prickly poppy.....	Argemone Mexicana.
Indian Birthwort.....	Aristolochia indica.
Dhak kino.....	Butea frondosa.
Indian hemp.....	Cannabis sativa.
Senna leaves.....	Cassia senna.
Purging cassia.....	Cathartocarpus fistula.
Clitorca.....	Clitoria ternatea.
	Cocculus indicus.
	Colchicum.
Croton seed.....	Croton tiglium.
Colocynth.....	Cucumis colocynthis.
Thorn apple.....	Datura stramonium.
Foxglove.....	Digitalis purpurea.
Borneo camphor.....	Dryobalanops camphora.
Gamboge.....	Garcinia pictoria.
Dikkamully gum.....	Gardenia lucida.
Bonduc nut.....	Gulandina bonduc.
Chaulmoogra.....	Gynocardia odorata.
Country Sarsaparilla.....	Hemidesmus indicus.
Hydrocotyle.....	Hydrocotyle asiatica.
Henbane.....	Hyoscyamus niger.
	Juniper berries.
	Kreyaf.
Linseed.....	Linum usitatissimum.
Chiretta, variety of.....	Ophelia elegans.
Assafetida.....	Narthex assafetida.
Opium.....	Papaver somniferum.
Cubebs.....	Piper cubebs.
Black pepper.....	Piper nigrum.
Indian Leadwort.....	Plumbago zeylanica.
True kino.....	Pterocarpus marsupium.
Pomegranate Rind.....	Punica granatum.
Rhubarb.....	Himalaya and Tibet.
Castor Oil.....	Ricinus communis.
Different sorts of Galls.....	Terninalia catappa, and other species.
Country Ipecacuanha.....	Tylophora asthmatica.
Sarsaparilla.....	Smilax.
Nux vomica.....	Strychnos nux vomica.
Clearing nut.....	Strychnos potatorum.
Connessi bark.....	Wrightia antidysenterica.

The Tenasserim Provinces are rich in medicinal plants, both in number and quality. Lindley's *Flora Medica* contains descriptions of all the known medicinal plants in the world, and more than a tithe of the whole number may be seen growing on the Tenasserim coast. If deprived of European drugs and left to our own resources, good substitutes could be found for almost every article in the medical flora. The bark of the root of the red cotton tree, and the roots of the clitoria are emetic; and the root of Tylophora vomitoria has been pronounced by Indian practitioners not inferior to ipecacuanha for any of the purposes to which that medicine is applied. Cassia fistula

MEDINA.

pods, the chebula fruit, the root of the heart seed, the seeds of the sapodilla, the Otaheite gooseberry, and physic nut are aperient or purgative. The gum of the white cotton tree, the bark of *Wrightia antidysenterica*, and the peel of the mangosteen are prescribed in bowel complaints. The green fruit of the papaya, the root of the Persian lilac, and the fruit of the Rangoon creeper are vermifuges. The bitter roots of *Sida acuta*, and *Tephrosia purpurea*, and the seeds of the musk-mallow or musk plant, are deemed cordial and stomachic, and the bark of *Guilandina bonduc*, is considered a good substitute for chinchona where that cannot be had. The decocted leaves of the goat-footed ipomoea are used as an external application in colic. The leaves of the *Vitex trifolia* are applied in diseases of the spleen. The bark of the white plumbago root will raise a blister, almost as quickly as cantharides. The oil of the cashew nut has been used successfully in ring-worm, ulcers and corns. The mango tree exudes a large quantity of gum-resin resembling bdellium, and an indigenous pine can furnish any quantity of turpentine. The bark of the root, the leaves, and the fruit of the Bengal quince, are as popular with the natives, as the root, bark, flower, and fruit of the pomegranate, which have been famous for their medicinal properties ever since the days of Celsus. Many medicinal substances, employed in India, are unknown in any European pharmacopoeia. Calomel, a chloride of mercury, as used in medicine by European and Native medical practitioners, is also known in India as *Ras-kapur* but it is rarely free from soluble corrosive sublimate unfitting it for medicinal use and is often present in poisonous proportions. —*M. B. of 1857. Dr. Mason's Tenasserim. The Indian Field. Dr. N. Chevers, President in Proceedings the Bengal Medical Association, Bombay Times. Dr. Murdoch's letter to Lord Napier. Dr. Impey. MEDICINAL ACACIA. ENG. *Acacia catechu*. —*Willd.*

MEDINA, a town of Bahrein island. See *Kattywar*.

MEDINA, about a day's journey distant from the port of Jambo, is a city of moderate extent, surrounded with indifferent walls, and situate in a sandy plain. Before the days of Mahomed, this city was called *Fathreb*, but it was re-named *Medinat-un-Nabi*, the City of the Prophet. The tomb of Mahomed is at Medina and is held in respect by the mahomedans, but they are not obliged to visit it in order to the performance of any devotional exercises. Mahomedans attach much

MEEANEE.

importance to, and consider sanctity derivable from, burial in particular spots, though the notion appears so entirely contrary to the spirit of their religion. Great numbers of dead are sent continually from all parts of Persia for interment, at the sepulchre of Ali on the frontier of the Arabian desert. The prevailing idea is that, by being buried near a holy saint, they will be raised along with him at the resurrection, and receive his protection and countenance, but the opinion is certainly heterodox. A similar idea seems to have been received in Israel of yore, the old prophet of Bethel desired to be buried beside the man of God that came from Judah, whom he had deceived into his destruction, and Acts 7 and 15-16 is to the same effect. One traveller relates that he met a caravan of dead. Each mule bore two dead bodies slung like portmanteaus on either side; and by the time they reach their destination their loathsomeness burdens must be in a shocking state; for already the effluvia was most obnoxious. A few of the friends and relatives of some of the deceased, were accompanying this mournful caravan but by far the greater number of the corpses had been consigned to the muleteers, without any one else to look after them. —*Niebuhr's Travels*, Vol. II. 39, p. 40. See *Khazerij*, *Khalif*; *Wahabi*.

MEDUS, and **Palvar** rivers, the modern *Murghab*.

MEDUSÆ, a group of the *Acalephæ*. *Aurelin*, *Pelagra*, *Chrysaora* and *Chrysopora* are the more common genera. They have the power to inflict a stinging pain. —*Fiquier*.

MEDYA-WAR or *Mewar*. The central region, a territory of India bounded to the north by the *Aravalli*, to the south by the country of the *Pramara* race of *Dhar*. —*Tod's Rajasthan*, Vol. II. p. 8. See *Media Bhumi*.

MEE. BURM. Fire.

MEE. DUT. Madder.

MEEANEE. A Sind village, 6 miles on the north of the town of *Hyderabad*. *Meeanee*, is the general name for the little villages

MEENA.

in Sind'h, populated chiefly by fishermen.—*Burton's Sindh*. Vol. II. p. 47.

MEEAN MILILE. A Ceylon wood, very hard, fine, closed grained and heavy.

MEE-GASS. **SINGH.** *Bassia longifolia*. Willd. See Mee-tree.

MEEGONG - KARAPINCHEE - GASS. **SINGH.** *Bergera nitida*, Thw.

MEE-KYAUNG-KYAY. **BURM.** In Tavoy, a heavy wood, not liable to be attacked by insects.—*Dr. Wallich*.

MEEI. **DUT.** Meal.

MEENA. The Meena race constitute a large portion of the population of Rajputana, especially in the Jeypur country between Ajmir and Delhi. They are supposed to be related to the Mhair, or Mer, or Mair and out of their own country are known as fine powerful men, principally dacoits. Colonel Tod, writing in the early part of the nineteenth century says, that the Meena afford an excellent practical illustration of Menn's axiom, that "the right in the soil belongs to him who first cleared and tilled the land." The Rajpoot conqueror claims and receives the tribute of the soil, but were he to attempt to enforce more, he would be brought to his senses by one of their various modes of self-defence—incendiarism, self-immolation, or abandonment of the lands in a body. Throughout India, he adds, where traces of originality yet exist, it will invariably appear that the right in the soil is in the cultivator, who maintains even in exile the huk bupota-ca-bhom, the ancestral right to the land, in as decided a manner as any freeholder in England.

The Cheeta-meena are a branch of the Meena race, from whom sprung the Mair or Mera race, the mountaineers of Rajpootana, one of the aboriginal races of India, whose country is styled Mairwarra, or "the region of the Mair." The Mair is a branch of the Meena or Maina. The Mair is also called Mairote and Mairawut; Mairwarra is that portion of the Aravalli chain between Komulmer and Ajmeer, a space of about ninety miles in length and varying in breadth from six to twenty. Rajpootana rises from three to four thousand feet above the level of the sea. Meena is a mountain' in Sanscrit; Mairawut and Mairote 'of or belonging to the mountain;' the name of the Albanian mountaineer, Mainote, has the same signification. The Mair are a branch of the Cheeta, an important division of the Meena, a race which consist of as many branches as their conquerors the Rajpoots. All these wild races have the vanity to mingle their pedigree with that of their conquerors, though in doing so they stigmatize themselves. The Cheeta-Meena in this way

MEENA.

claim descent from a grandson of the last Chohan emperor of Delhi. Unail and Anoop were the sons of Lakha, the nephew of the Chohan king, and the coconut was sent from Jessulmir, offering princesses of that house in marriage, but an investigation into their maternal ancestry disclosed that they were the issue of a Meena concubine: and their birth being thus revealed, they became exiles from Ajmir, and associates with their maternal relatives. Unail espoused the daughter of a Meena chieftain, by whom he had Cheeta, whose descendants enjoy almost a monopoly of power in Mairwarra. The sons of Cheeta, who occupied the northern frontier near Ajmir, became mahomedans about fifteen generations ago, when Doodha, the sixteenth from the founder of the race, was created Dawad Khan by the hakim of Ajmeer; and as Athoon was his residence, the "Khan of Athoon" signified the chief of the Mairote. Athoon is still the chief town of the Mair race. Chang, Jhuk, and Rajosi, are the principal towns adjoining Athoon. Anoop also took a Meena wife, by whom he had Burra, whose descendants have continued true to their original tenets. Their chief places are Burra, Bairawarra, Mandilla, &c. The Meena were always notorious for their lawless habits, and importance has been attached to them so far back as the period of Beesildeo, the celebrated prince of Ajmir, whom the bard Chand states to have reduced them to submission, making them "carry water in the streets of Ajmir." Like all mountaineers, they broke out whenever the hands of power were feeble. The Meena of Mewar were the prior occupants of Marwar and Jeypoor, till driven out by the Rajpoots. The most powerful clans of the Marwar Meena found shelter in a strip of country at the junction of Boondce, Meywar, Jeypoor and Ajmir, called the Kherar. They are a very brave, bold, race. The Jeypoor Meena in like manner have their stronghold at the junction of Ulwar, Jeypoor and British districts. In Serohee, the Meena are still the aborigines.

The Meena are active and energetic and are concerned in most of the dacoities of Northern India. When Colonel Tod wrote in the early part of the nineteenth century he mentioned that on the borders of Little Sadri, where the quotas are posted, is a mountainous tract covered with deep forest, the abode of the half savage Meena and Bhil. Mixed with them are the estates of some vassal chiefs, whose duty it was to repress their excesses. The people who occupy the Aravalli, are the Meena mountaineers, a robber predatory race. The hills are rich in mineral products, and enabled

MEENA.

the Mewar family long to struggle against superior power and to raise those magnificent structures which ornament their kingdom.

In Northern Rajpootana the country to the east of Shekhawattee is the chief home of the plundering Meena, and it is a region politically as well as naturally favourable to the dacoit and the thief. Wild hills and ravines abound in parts of it. Within a radius of twenty-five miles is comprised a territory subject to no less than nine Governments, namely a part of Shekhawattee and Jauravatten in the dominions of the maharajah of Jeypore, Kol-Poottee belonging to the raja of Khetree, but held direct from the British Government, Dadree to Jheed, Narnoul to Pattiala, Kante to Nabha, a portion of Ulwar, Loharoo and Bikaner and Shalhjepanpore where lie the Meena settlements of the district of Goorgaon. These tracts are superintended by several officers, the Commissioner of Delhi, the Commissioner of Umballa and the Rajpootana Political Agencies. The Meena are not of low caste like the Sansee, the Bhowree and other thieving tribes. A thousand years ago, Meena chiefs ruled much of the territory now held by the maharajah of Jeypore. A clan of them are still the hereditary guards of the city gates and of the fort which holds the treasures of the State. Many years ago Sir W. Sleeman pronounced the Meena "irreclaimable," and when Col. Younghusband, about 1864, took the Berar Police in hand and began operations which resulted in complete success, the Meena from the north were the most formidable class with whom he had to deal. The Thuggee and Dacoity Department has been bringing the Meena to justice ever since its operations began, but special efforts and systematic proceedings against them in their homes have never been pursued so persistently and vigorously as the matter required. An officer was then appointed to conduct, under Col Hervey's direction, operations for the suppression of dacoity throughout Northern Rajpootana, amongst the Meena, who in consequence of the late famine, had been doubly active in robbing the Government mail and committing other depredations. They make free use of the railway and have, it is said, resolved in council assembled to continue their mode of life and resist all measures of repression and reform. The Meena to the north of Jeypore are not more likely to defeat the object arrived at than were the Parihar Meena to the south of it, whose suppression has been recorded by the late Capt. Bruce, Political Agent of Harotee. The mode of proceeding in Native States, when the chiefs act at all against

MEERANZYE.

robber tribes, is to drive them away if possible, and this was formerly the system in Jeypore. But as Major Beynon in his report on that State remarks, the true way of dealing with them is to control their movements at their homes, where they rarely commit depredations. The successful plan pursued against the Parihar, was to hold the headmen responsible for the presence of the Meena in their villages. None could absent themselves from their respective villages without a leave certificate, or if any did so they were liable to be seized and punished. This system of controul has not been regularly introduced into any of the villages of Jeypore or the territory adjoining, but with the aid of the Political Agent and the frequent visits of the dacoity suppression officer it might be done efficiently in the adjoining pergunnah of Shalhjepanpore in Goorgaon, where many of the worst disposed Meena live. *Mr. Campbell*, p. 45. *Colonel Brooke*, in *Literis. Tod's Rajasthan*, Vol. I., p. 681. Vol. II. p. 612, 672. See *Med*.

MEENA, a term commonly used in the Punjab, expressive of contempt or opprobrium.—*Cunningham's Hist. of the Sikhs*, p. 57.

MEENABAN BURN. is called Moulmein Laucewood, and is useful for handles of tools, but it is not equal to laucewood in elasticity, Major Benson thinks its qualities have been generally overrated, besides, it is liable to the attacks of insects.

MEENA-BAZAR or Mina Bazar, MAHR. An exhibition.

MEONG TOOTOOL, MALAY of JAV. *Felis pardus*. *Linn. Penn. Sykes*.

MEEP-THUA-BAN. BURM. In Tavoy, a small sized, compact, grey wood: used for handles, &c.—*Dr. Wallich*.

MEER. A title by which the Syeds the descendants of Mahomed, are called.

MEERA BAL, was a daughter of the Rahtar of Muirta, the first of the clans of Marwar, and the wife of rana Koombhoo of Chitor, she lived almost in the middle of the fifteenth century, and was celebrated for her beauty and her romantic piety. She was a poetess, and some of her odes and hymns to Krishna are yet admired and supposed to equal in merit those of Jayadeva, she visited all the shrines of Krishna from the Jumna to Guzerat.

MEER ALUM See Hyderabad.

MEERAN MOHI-OD-DON. See Duttageer.

MEERANZYE. In continuation of the Kohat Palley there runs the valley of Hungoo, or Hangoo, twenty miles long by two or three broad, which opens into the plains of Meeranzye. This latter plain, about nine miles square, and bounded on the south-west by

MEER SCHAUM.

the Khoorum river, scarcely twenty miles distant from where it emerges into the Bunnoo plain, is held by seven fortified villages. The Zymosht Affghan are a small, but brave tribe, numbering about 5,000 fighting men, some of whom are well mounted. They inhabit a valley leading from western Meeranzyo onward, towards the crest of a range called the "Powar Kothul." Their country of right belongs to the Cabul kingdom. They are usually ready to combine for mischief with the Tooreo and Ornkzye, and to threaten Meeranzyo; they hold some land in the plains, which holding affords some p'edge for their good behaviour.—*Records of the Government of India*. See Khyber.

MEERAPA-KAILLU. TEL. Capsicum.

MEERASDAR. A term in use amongst the Bombay revenue officers, signifying a hereditary occupant of land, whom Government cannot displace so long as he pays the appointed assessment on his field.

MEER JAFIR, to meet his pecuniary engagements, had recourse to the severest exactions. He resigned himself to unworthy favorites; and it became necessary to depose him in favor of his son-in-law, Meer Kasim Ali Khan, with whom a treaty was concluded on 27th September 1760, by which the British obtained possession of Burdwan, Midnapore, and Chittagong. Serious disputes arose between Meer Kasim and the British regarding the right of the servants of the E. I. Company to trade and to have their goods passed free of duty and which led at last to war. In 1764 Meer Jafir agreed in addition to the sums for which he had contracted in a recent treaty, to pay five lakhs a month towards the expense of the war then being carried on against the vizir of Oudh, so long as it lasted. Meer Jafir died in January 1765, and was succeeded by his son Nujum-ud-Dowla, with whom a new treaty was formed, by which the Company took the military defence of the country entirely into its own hands, and among other conditions the nabob bound himself to appoint, by the advice of the Governor and Council, a deputy to conduct the Government, and not to be removed without the consent of the council.

MEERSCHAUM, a mineral belonging to the series of silicates of magnesia. It is dull-white, opaque, and earthy, nearly like clay. Its hardness is 2.0, and specific gravity 2.6 to 3.4. A variety from Anatolia, analysed by Thompson, gave in 100 parts. Silica, ... 42.0 | Water, ... 23.0 | Aluminium, 2.0 | Magnesia, 30.5 | Lime, ... 2.3 |

When heated it gives out water and a fetid smell, and becomes hard and perfectly white. When first dug up it has a greasy feel, like

MEGACEPHALON.

soap, and on this account is used by the Tartars in washing their linen. It is known in Europe from its being made use of in Turkey to make the bowls of tobacco-pipes, which are hence called meerschaum, and are imported into Germany where they are softened in tallow and wax, and then polished.—*Dana, Mineralogy*.

MEERUT, a town and military cantonment in the north-west of India.

MEERZA. PERS. When placed after a name signifies a prince, as Mahomed Ali Meerza; Hussan Ali Meerza; it is derived from the Persian compound word "ameerzadeh," born of a chief or prince. When prefixed to the name, as Meerza Musa, Meerza Hussan, &c., it signifies a man of learning, or of the pen, a man whose occupation is to write, and whose habits of life are civil.—*Malcolm's History of Persia*, Vol. II. p. 411. *Fraser's Journey into Khorasam*, p. 63.

MEERZADA an honorary title of mahomedans.

MEERSEE, a dentifrice: meesce dan, a box for holding meesce.

MEET, MAL. Salt.

MEET-GNYOO, BURM. A fruit tree of Amherst, with a red coloured, useful, strong, heavy, wood: It is probably a species of Acacia.

MEETHA, HIND. a preparation of aconite root.

MEETHIA KADHOO. HIND.

Cucurbita Pepo. | Sweet Pumpkin.

This is grown like all the other species, and if hung up in a dry place is an excellent store vegetable, keeping for several months.—*Riddell*.

MEETHIA-KAMARANGA. BENG. HIND. Averrhoa carambola.

MEETHIA NIMBU. HIND. Limes. Citrus acida properly Mutha nimbu.

MEETHIA PALAOO. Vide Palao.

MEETHIA TEETHA. HIND. A preparation of aconite root.

MEETHA THA-KA-TET, HIND. Oil of Sesamum orientale.—*Hind*.

MEETHIEE. HIND. Trigonella fennugrecum, Fennugreek, a small annual, commonly cultivated in India during the cold season. The greens are used by the natives and the seed in curries. It is sown like all other common greens.—*Riddell*.

MEE TREE, of Ceylon, Bassia longifolia, grows to an enormous size, affords a good shelter, and yields a useful pungent oil. Its flowers have an unpleasant smell, they are white, and fall so abundantly on the ground as to give an appearance of snow.

MEGACHEPHALON RUBRIPES, the Maleo, deposits its eggs in the loose sand of

MEGAPODIDÆ.

the sea beach, in holes just above high-water mark; the female lays one large egg, which she covers over and returns to the forest; but many birds lay in the same hole. A dozen eggs are often found together. One egg fills an ordinary tea-cup, from 4 to 4½ inches long, and 2¼ to 2½ wide. They are very good to eat, and much sought after. The hen-bird takes no further care of the eggs, which the young bird breaks through about the 13th day and runs at once to the forest. Each hen lays six or eight eggs in the season of two or three months.—*Professor Birkmore's Travels*, pp. 101 to 378. *Wallace's Malay Archipelago*, Vol. i. p. 175.

MEGACHILE. The leaf-cutter bee. Their nests are to be found in thousands in the cliffs of the hills of the Soane valley with mayflies, caddis-worms, spiders, and many predaceous beetles.—*Hooker Him. Jour.*, Vol. I. p. 52.

MEGADERMA LYRA. This bat is the *M. carnatica* of Mr. Elliot and seems to be very generally diffused throughout India, being replaced in the Malay countries by *M. spasma* and further east by the newly described *M. philippinensis*, *Waterhouse*, P. Z. S. 1843 p. 69, while in Africa it is represented by the *M. frons*.—*Mr. Blyth's Report*. See *Cheiroptera*.

MEGADERMA SCHISTACEA. Slaty blue Megaderme.

MEGADERMA SPAS. *Cheiroptera*.

MEGADERMA RADIATUM. A mollusc of the rivers of India and Ceylon. See *Veneridae*. *Mollusca*.

MEGALAIMA INDICA, *Latham*

M. Philippensis var. *Lath.* | *M. Indica*, *Lath.*
Greater red-headed barbet. | Copper-smith.

The incessant call of this bird resembles the blows of a smith hammering a cauldron. There are several species of this genus, viz. *M. flavifrons*, *M. rubricapilla*, and *M. Zeylanica*. *Jerdon, Birds of India Tenent, Sket. Nat. Hist* p. 242. See *Birds*.

MEGALAMIDÆ, a family of birds comprising 2 gen. 15 sp. viz., 14 *Megalama*; 1 *Megalorhynchus*. See *Birds*.

MEGAM PATTOO. See *Salt*.

MEGAPODIDÆ. A family of Gallinaceous birds, found in Australia, and its surrounding islands, as far west as the Philippines and the N. W. of Borneo. They bury their eggs in sand, earth or rubbish and leave them to be hatched by the sun or by fermentation. They have large feet and long curved claws, and most of them rake together rubbish, dead leaves, sticks and stones, earth and rotten wood, until they form a mound often six feet high and twelve feet across, in the middle of

MEGASTHENES.

which they bury their eggs. The eggs are as large as those of a swan, and of a brick red colour, and are considered a great delicacy. The natives are able to say whether eggs lie in the mounds and they rob them eagerly. It said that a number of these birds unite to make a mound and lay their eggs in it, and 40 or 50 are found in one heap. The mounds are found in dense thickets. The species of the Megapodidæ in Lombok is as large as a hen, and entirely of a dark hue with brown tints. It eats fallen fruits, earth worms, snails, and centepodes, but the flesh is white and when properly cooked well flavoured.—*Wallace* 154, 156. See *Gallus*.

MEGAPODIUS, or *Leipon*, is called by the natives of Borneo by the very appropriate name of *Menambun* (from *Tanibun*, to pile, to heap up.) One nest, or heap, was found close to the edge of the sea sand, and was formed over a fallen *Arn* or *Casuarina* tree and covered, but not densely, with shrubs. The pile was sixty feet in circumference. These birds lay most disproportionately large and thin-shelled eggs, and the young comes forth from them well-plumed and sufficiently advanced to make their way in the world. The *Megapodius nicobarensis* has not hitherto been met with excepting in the Nicobars, but would appear to be "common on all the islands" of that group, according to the personal observation of the Rev. J. Barbe, p. 351-2,—*Keppel's Ind. Arch.* Vol. II, p. 120.

MEGAPODIUS CUMINGII occurs in Labuan.

MEGASPIRA, a genus of mollusca.

MEGAPTERA KUZIRA, a finner whale of the Japanese Seas. The Finners are *Megaptera Kuzira*. The *Kuzira*. It inhabits the Japanese seas.

Physalis iwasi. The Japan Finner. It is very rare. In 1760 one, 25 feet long, was cast ashore at Kii.

Physalis antarctica. *Gray* Inhabits the New Zealand seas.

Physalis Braziliensis. Bahia Finner was brought from Bahia.

Physalis australis. The southern Finner, inhabits the seas of the Falkland islands. See *Mammalia*, *Whales*.

MEGASTHENES, the envoy sent by Seleucus Nicator, one of the immediate successors of Alexander the Great, to negotiate a peace with Sandracottus, the Chandra-gupta of India. Megasthenes was perhaps the first European who had ever beheld the Ganges. He dwelt for several years in Palibrotha, on the banks of that river, a city supposed to have occupied the site of the modern Patna, at the confluence of the Sone, and afterwards

MEHDI.

wrote an account of the country, which, though now lost, has probably been transmitted to us pretty closely in the narratives of Diodorus Siculus, Strabo and Arrian. Yet though his minuter details seem, nay, in many respects are,—totally undeserving of credit, his general description of India may, curiously enough, be commended for its accuracy. Moreover it is to Onesicritus, one of the companions of Megasthenes, that we are indebted for the earliest account of Ceylon or Taprobane. From him we first hear of its trained elephants, its pearls and its gold. Megasthenes maintained friendly relations at the Court of Palibothra, between Syria and India and effected a matrimonial alliance. His journal names as rivers Cainos, the Cane; Cossoanns, Cosa or Coss; Sonus, Soane; Condochates, Gunduck; Sambus, Sumbul or Chumbul; Agoramis, Gogra; Commenses, Carannassa, &c. &c.

Diamachus was the next Greek ambassador after Megasthenes.—*Gal. Rev.* 1868. *Rennell's Memoir*, p. 30. *Bjornstjerne's British Empire in the East*. See India. Inscriptions, Scylax. Shaman.

MEGEONE, BURM. In Tavoy, a large tree used in building.—*Dr. Wallich*.

MEGHA, See Horace Hayman Wilson.

MEGHA-NADA, SANS. from meghā a cloud, and nadā, a sound.

MEGHA-NAT'HA, SANS. from megha, a cloud, and nat'ha, a lord.

MEGH DUTA, See Singhpoo.

MEGILA, See *Corchorus olitorius*.

MEGHUSADAMA, See Indra.

MEGHA-VAHANA, SANS. vahana, a vehicle.

MEGNA, a river of Bengal, runs near Bhowany gunj in Dacca.

MEIAL or Kainth, wild pear, an apple of the hills, *Pyrus baccata*, *Pyrus variolosa*.

MAHAL, properly Mahal, a palace, a district. The Tributary Mahals form a district in Central India. The Commissioners could give no details of the effect of the famine of A. D. 1867, in these districts. Mohurbhunj is a very large territory covering an area of upwards of 4,000 square miles, and the greater part of this tract must be included in the area of most severe suffering; but the roughest approximate estimate of the mortality cannot be given.

MEHAN of Kulu, *Ulmus campestris*, the elm.

MEHDI, the twelfth and last Imam, Mahomed, surnamed Mehdi; i.e., director and leader, the Persians believe to be still alive, and that he will reappear with Elias the prophet on the second coming of Jesus Christ. The Mehdaui or Ghair Mehdi are

MEHMANDAR.

not a race but a small mahomedan sect, though mostly Pathans, who believe that a religious man, who was born in Jonepur in the 16th century was Mehdi, or the prophet Elias on his second coming, and they are styled Ghair or "without" Mehdi, because he has, in their belief, come and gone. *Herklot, Qanoon-i-Islam*.

MEHIDPUR, battle fought on the 21st December 1817. See *Mahratta Governments in India*. *Statistics of Battles*.

MEHINTELAI, "the Mountain without fear," in Ceylon, is a precipitous rock about seven or eight miles to the north-east of Anarajapoor, but connected with the ancient city in the time of the kings by one continuous street, along which were conducted the solemn processions of the bud'hist priests. The ascent to the summit is effected by a series of stone steps, about two thousand in number, winding past the ruins of former buildings, temples, dagobas, and shrines; and on the loftiest peak, which commands a view over the forest country beneath to the very verge of the horizon, there exists one of those prodigious structures of brickwork, under which is deposited a sainted relic of Buddha—a hair which grew on a mole between his eyebrows. With such veneration have the Singhalese been accustomed to regard this sacred mountain, that every crag has some tradition, and every rock has been scarped into sites for religious buildings, amidst the ruins of which are to be traced the fragments of broken statues, and inscriptions in the Nagari character, the most ancient in which the dialect of Pali has been written. The ruins of Anarajapoor, form one of the most conspicuous objects in the grand panorama which is beheld from Mehintelai. They cover an extent of ground equal to sixteen miles square, once surrounded by a wall sixty-four miles in circumference. The city is to be found on the map of Ptolemy, in its proper site and ancient name, Annrogrammum.—*Tennent's Christianity in Ceylon*, p. 336.

MEHL. GER. Meal.

MEHMAN, a mahomedan sect, numerous about Hyderabad, Sehwan and Kurrachi. They are largely engaged in trade, and are a quiet race. They are converts to mohamedanism. See Mahman.

MEHMANDAR, from the Persian word "melman" a guest, means a host, but is the term applied to a person appointed on the part of government to attend upon, and supply the wants of strangers, while travelling through the country. This custom is most particularly observed towards all ambassadors from foreign powers. The provision

MEIACOSHEMA.

thus furnished is called soorsat; and it forms one of the most grievous parts of the saaderat, or irregular taxes; for it is claimed not only by strangers, but by all great men, or messengers travelling on the part of the king, and is levied with extreme severity.

Usually on his arrival at a town or village, the mehmandar sends for the mayor, the Ket-Khuda, to whom he briefly gives his orders to furnish the articles required, and, by way of commencement, installs himself in the best house in the place; he then proceeds to the mosque or principal square.—*Ferrier Journ.*, pp. 47. *Fraser's Journ. into Khorasan*, p. 88.

MEHMODEH, HIND. *Convolvulus scammonia*, *Lin.*

MEHMASANI, a Baluch tribe who have branches in Seistan, and the hills of Luristan.

MEHNDI, HIND. *Lawsonia alba*, the henna of the Persians, an important dye-stuff, and the distilled water of its flowers is used as a perfume. The mahomedan women in Asia use the shoots for dyeing their nails red, and the manes and tails of horses are also stained red in the same manner. The soles of the feet also are stained with the red juice of the Mehndi. Mehndi is also a term applied to *Elsholtzia polystachya*. Jangli mehndi, is *Ammannia auriculata*, Vilayati mehndi, is *Myrtus communis*.

MEHIRA a forest in Hazara from which the following timbers were sent to the Exhibition of 1862.

Walnut.	Juglans	Olive
Toon.	Cedrela	Burongti
Bear.	<i>Pinus longifolia</i>	Unloko
Ash.	<i>Fraxinus</i>	Mulberry
Reen.	<i>Quercus</i>	Loon. Pyrus
Yew		Kungur or Kukker.
Kayan		<i>Fraxinus</i> .
Fir <i>Pinus longifolia</i>		Deor or Deodar.
Kalanath. <i>Cerasus</i>		<i>Cedrus deodara</i> .

MEHRAWUN. A brother of Ravan, who, in the war of Lanka, by a surprise, took Rama and Lakshmana prisoners, and carried them to Patala (or hell), from whence they were released by Hanuman as they were to be sacrificed.

MEHTAR, HIND. Bhangar bij.

MEHTAR, HIND. MAR. a hereditary village officer. A man who follows the lowest menial offices, a sweeper, a scavenger. The term originally means a prince, and is used ironically. In Cuttack, the mehtar is sometimes a slave.

MEHUNT, a commander of the ascetic warriors of Mewar, the chief monk or abbot of a hindu monastery properly Mahunt.

MEI, PERS. Wine.

MEIACOSHEMA or Madjicosema islands,

MEIN.

a group on the east coast of Formosa, lying between 24° 4 and 25° 6 N. and 122° 52½ and 125° 30 E. the western islands are named Kou-mi, Koo-kien-san and Pa-tching-san, and the island of Ty-pin-san lies on its eastern edge.—*Horsburgh*. See India.

MEIDZ, POL. Copper.

MEI-THEI-LEI, the valley of Manipore is called by the Maniporee people Meitheilei pak. The Burmese call it Ka-the, the Bengalees Moglai, and Assamese Mekle. The area of the whole Manipur territory is about 7,000 square miles, and that of the central valley about 650. Much of the valley is at all seasons covered with water. It seems indeed at one time to have formed a large lake, and the piece of water in the south called the Logtak, appears to be the unfilled but rapidly filling remnant of it. From the most credible traditions, the valley appears originally to have been occupied by several tribes, the principal of which were named Koomul, Looang, Moiang' and Meithi, all of whom came from different directions. For a time, the Koomul appears to have been the most powerful, and after its declension, the Moirang tribe. Of the population, composed of different classes, the principal is the Meithe, next the Poonguai, after whom the Teng kul, the Ayokpa, the Kei, the Loeo and Muealman. The Meithe population is divided into four parts called "Punnah," which are designated in the order of their seniority "Kaphum," "Lai plum," "Ahnloop" and "Niharoop." The Loeo population consists of people who pay tribute, and is considered so inferior that the name Mei-the is not given to it. The marshes of the south in the vicinity of the Logtak afford a retreat to serpents of a formidable size, and the whole valley of Manipore is much infested by the serpent tribe. Some of them are exceedingly active and bold, as the Tanglei. It is fond of ascending bamboos, along the branches of which it moves with great velocity, and if enraged, throws itself from an extraordinary height upon the object of its anger. Its bite is said to be mortal. This, added to its great activity and fierceness makes the Tanglei an object of much terror.—*McCulloch's Records Government of India, Foreign Department*, p. 103. See Khntri.

MEIH TAOU, a group of islands in the Gulf of Pe-tche-lee.

MEI-JIN, CHIN. A matchmaker, a go between, a middle-man.

MEI-KWE-HWA, CHIN. Rose.

MEILAZZO DI ZUCCHERO, It. Molasses.

MEIL DE AZUCAR, Sp. Molasses.

MEIN, TAM. Fish.

MEIKONG.

MEINAM, a river which disembogues into the Gulf of Siam. The area of the valley of the Meinam has been estimated by some authorities at about 12,000 square miles, but this extent probably embraces only that alluvial portion of the soil which is visited by the annual inundations. The Meinam has its source in the mountains of Yunnan in China, at a distance of about 800 miles from its mouth. It receives many tributaries in its course, divides itself after receiving the waters of the Phitsalok branch, and again unites above Bangkok, where, with a depth of from six to eight fathoms, it rolls its magnificent tide into the Gulf of Siam. Menam in Siamnese is a generic name for river; and is one of the names of the Bangkok river another meaning given, however, is mother of waters. The true name of the Bangkok river is 'Menam Chan Phya,' but it has become obsolete. At the present time, the river is only navigable to a distance of about thirty leagues. It disembogues itself through its three mouths at the head of the Gulf of Siam, after a course of nearly eight hundred miles.—*Bowring's Siam*, Vol. I, p. 1—10.

MEISAKSHI, HIND. TAM. Amyris compniphora. Its gum, is the bdellium.

MEIKONG. A large river which flows through the eastern side of Laos and Cambodia. It is said to be more than 2,200 miles long, but much interrupted by shallows and sand banks at its mouth. In the Lusiat it is noticed thus;

See thro' Cambodia Meikon's river goes,
Well named the Captain of the waters, while
So many a summer tributary flows
To spread its floods upon the sands, as Nile
Inundates its green banks.

In the Irawadi and Meikong basins, there are remnants of tribes strongly distinguished from the predominant races and tending, with the evidence of language, to show that the ethnic history of Ultra-India is very ancient and has undergone repeated revolutions. One of the most remarkable is the Ku-Kyen. They are described as being in their appearance not Mongolian and totally different from the surrounding Shan, Burmese and Chinese races. The Moi or Ka-moi, on the opposite side of the Mekong, are said to be black savages, with negro features. They occupy the broad expansion of the Anam chain towards Kamboja, and appear to extend northwards along these mountains, marching with the Lau on the westward. The Kambojans style them Kha-

MEKRAN.

men. They are the Ko-men of Leyden and the Khamen of Gutzlaff. On the same side of the Meikong basin, but towards the sea, between 11° and 12° N. L. a hill tribe, called Chong, preserve more of the ancient Australo-Tamulian character than the surrounding tribes. In the Chong, the hair, instead of being stiff or harsh as in the Mongolian, Tibetan and prevalent Ultra-indian and Malaya-Polynesian races, is comparatively soft, the features are much more prominent and the beard is fuller.—*Bowring's Siam*, Vol. II, p. 28. *Mr. Logan in the Journ. Ind. Archip.* See India, Karen, Kaku, Kakua, Kho, Kamboja.

MEKRAN, a province of Beluchistan diversified by mountain and desert, stretching westward along the coast. It is the ancient Gedrosia and it extends along the Indian Ocean, from Cape Jask to the borders of Sindh which bounds it on the east: on the West and N. W., it has Kerman; and on the North, Seistan and Arokaje. Alexander the Great, after his conquests in N. W. India, returned through this province; and the suffering of his army from want of water and provisions, gives us a most disadvantageous idea of the country, which has been represented as unfertile and full of deserts. There are, in Mekran, cyclopean structures raised by some unknown prior race. They are called Ghorbasta or Ghorband and bear a resemblance to the cyclopean remains of Europe. They are built across ravines to form tanks and on the declivities of mountains to distribute the water. They have been constructed by an agricultural race who, on entering it, had foreseen that the country would not otherwise support them and the race is supposed by Dr. Cook to have been Polasgi or a people with kindred habits. Arrian says that the fishermen on the coast of Godrosia lived in small huts, whose walls were composed of sea-shells piled upon each other, and their roofs of fish bones, the back bones serving instead of rafters.

The present population of Mekran is formed of many different tribes and independent chiefs of which the Baluch are the

MELALEUCON CAJAPUTI.

most numerous: a middle sized race of men, spare muscular, and active, and armed with a matchlock, sword, shield, and dagger. The common language of the country is a corrupt Persian, mixed with Sindi, and the generality of the Baluch are mahomedans of the sunni persuasion. Those of the centre countries reside mostly in towns; those of the lower countries are scattered over the plains, in hamlets of eight or ten huts, built of the branches of the palm, and covered with mats; but the Narhui race of Banpore live in tents of black hair, and remove from place to place, as their flocks or agriculture require their attention. The women of Mekran are treated in a different light from those of most other mahomedan countries, being allowed to appear indiscriminately in public.

Mekran is sometimes called Kej also called Kej Mekran. It is now inhabited by many tribes of whom the Gitchki is the most numerous, but about half the population is of a sect of mahomedans called Ziggar. The maritime and fishing population of the little ports on the coast of Mekran from Sauniani to Charbat, are denominated Med, and comprise four divisions, the Gnzbur, Hornari, Jellazai, and Chelmar-zai.—*Kinnier's Geographical Memoir*, p. 202, 204. See India, Kattiyawar, Kelat, Kerman, Med, Volcanoes.

Kaya-puteh, HIND. |

The oil.

Kayu-puteh-ka-tel, HIND. | Kayu-puteh-tailam, TAM.

Kayu puteh miniak, MAL.

This tree is found in Amboyna, Ceram, Celebes, and Sumatra. The Malays give the name of Kaya-puteh both to *M. cajuputi* and *M. leucadendron* but *M. cajuputi* is also called Daun Catsjil in Malay. It is a small tree with an erect but crooked stem covered with thick, rather soft, light-coloured bark; branches scattered, with slender twigs which droop like those of the weeping willow. It is a native of the Molucca Islands, especially of Boerou, Manipe and of the S. of Borneo. The leaves are collected on a warm dry day in autumn, and placed in dry sacks, in which they become heated and moist.

MELANITE.

They are then cut in pieces, macerated in water for a night, and then distilled. Two sackfuls of the leaves yield only about 3 drachms of the oil. This is clear and limpid, of a light green colour, very volatile, diffusing a powerful odour, having a warm aromatic taste, something resembling that of camphor, followed by a sense of coolness. Sp. Gr. 0.914 to 0.927; soluble in alcohol. It boils at 343°. When distilled with water, a light and colourless oil first comes over, and then a green-coloured and denser oil, which, with less odour, is more acrid. It is sometimes adulterated with the oils of rosemary and of camphor; it is diffusible, stimulant, antispasmodic; and is used externally in rheumatism. As a cure for cholera, oil of Peppermint is as useful. Cajuputi oil, appears to have been known only since the time of Rumphius, who describes two trees, viz. Arbor alba major, and Arbor alba minor. In 1798, Mr. Smith, of the Calcutta Botanic Garden, was sent to the Molucca Islands to obtain the true sort of Cajuputi plant. He obtained several, which were introduced into the above garden, and have since been distributed all over India, and it is able to stand the cold of N. W. India, probably owing to the thickness of its bark. Mr. S. sent specimens to England where they were ascertained by Dr. Maton to be those of the second kind, and named *Melaleuca cajuputi* a name which Dr. J. E. Smith afterwards changed to *M. minor*. The other species obtained by Mr. Smith in 1798, also called Cajuputi by the Malays is the *M. leucadendron*, of which the leaves are larger, more salate, 5-nerved, and smooth, but possess little or no fragrance, and are not known to yield any of this celebrated volatile oil. The *Melaleuca cajuputi*, is indigenous in the Karen forests of the southern provinces of Tenasserim but Dr. Mason has not observed it north of the valley of the Palouk river in latitude about 13°. Roxburgh asserts that *M. leucadendron*, *L.* a tree of the Moluccas, with small white flowers, possesses little or no fragrance in its leaves, and that it is seldom or never used for the distillation of the oil which is used in the European markets.—*Royle, Caranjur, Morrison Com. Theet-see.	Burm	Theet see	Eng.
Theet-see-yaing	"	Lignum vitæ	of Pegu.
Varnish tree	Eng.	Kheu of	MUNIPUR.
Burmese varnish tree	"		

This tree grows from Manipur southward to Tavoy. It was first seen near Prome, but is found in different parts of Burmah and along the coast from Tenasserim to Tavoy, extending from the latter in 14° to 25° N. lat., and Dr. Wallich has identified it with the Kheu or Varnish-tree of Munipoor, bordering on the north-east frontier districts of Silihet and Tipperah. It grows, especially, at Knbbu, an extensive valley elevated about 500 feet above the plains of Bengal, and 200 miles from the nearest seashore and it attains its greatest size there, some of the trees having clear stems of 42 feet to the first branch, with a circumference near the ground of 13 feet. It forms extensive forests, and is associated with the two staple timber trees of continental India, teak and saul, *Tectona grandis* and *Shorea robusta*, especially the latter, and also with the gigantic Wood-oil tree, a species of *Dipterocarpus*. It is in full foliage during the rainy season, which lasts for five months from the middle of May until the end of October. It is rare in the Irawadi valley, but common in the forests east of the Sitang river, particularly south-east of Sitang town. It is very common above the parallel of Tounggoo and grows there to a girth of six feet and it is plentiful in the Tounggoo and Prome forests especially in the former. Dr. Mason says, the celebrated Burmese black varnish tree, which is used to lacquer boxes, is cultivated in the Tenasserim Provinces, but he never saw it growing spontaneously. It is found very abundant in Amherst province, and grows in Tavoy and Mergui. Captain Dance says that its maximum girth is certainly 3 and said to be 4 or 5 cubits and maximum length certainly 20 and said to be 30 feet; and Dr. Brandis tells us that, in a full grown tree on good soil, the average length of the trunk to the first branch is 30 feet and the average girth measured at 6 feet from the ground is 9 feet. Its wood is the *Lignum vitæ* of Pegu, and is of a dark red color, or a dark brown, dense structure, and of particularly fine close grain. Of extreme closeness of grain and density of structure, it has a specific gravity so great, that it serves in place of iron as anchors for native boats. A cubic foot weighs lbs. 54, but it is not brought to Moulmein so heavy as Dr. McClelland des-

MELANORRHÆA USITATISSIMA.

cribes it. When seasoned it floats in water. It is very strong, durable, hard and tough, it is found to answer well for cogs of machinery and is used by the Burmese for tool helvies and the stocks of their wooden anchors, &c., for, the anchors of Burmese boats are always of wood to which stones are lashed, the flakes being of Pyeng Khado and the stocks of Theetsee or of some other heavy wood. Its great hardness and weight prevent its being employed in house building; but, it would answer for sheaves or block-pulleys and other purposes connected with machinery, where great strength and density are required. It is therefore recommended for handles of tools, also of sheave blocks, for machinery generally, for railway sleepers, for gun stocks, for rammer heads, and for helvies, in short for all purposes where a strong yet not very heavy wood is useful. It exudes a black gum which repels ants, and is used by the Burmese as a varnish. At Prome a considerable quantity of this varnish is extracted but very little at Martaban. It is collected by inserting a pointed joint of a bamboo, which is closed at the other end, into wounds made in the trunk and principal boughs, which are removed after 24 or 48 hours and their contents, which rarely exceed a quarter of an ounce, emptied into a basket made of bamboo and rattan previously varnished over. The collecting season lasts from January to April. In its pure state it is sold at Prome at about 2s. 6d. for about 3½ lbs. avoirdupois. This oil is obtained from a large tree, formerly common in the hills of this district. The oil is obtained by cutting a hole in the tree, about 3 feet from the ground, the cut being about 4 to 5 inches deep into the trunk of the tree. The base is hollowed out to retain the oil. The whole of the hollow is cleared with fire, without which no oil exudes; after it is cleared the oil exudes, and is collected in the hollow at the base, and removed at intervals. The oil is thus extracted year after year, and sometimes there are two or three holes in the same tree, while the tree does not die. The oil is allowed to settle on which the clear part separates from a thick portion, which is called the 'gand.' If a growing tree is cut down and cut to pieces, the oil exudes and concretes on the stem and end of the pieces, very much resembling camphor, with an aromatic smell also. It is said that the tree yields from 3 to 5 maunds yearly, i. e. 240 to 400 lbs., and the same tree will yield oil for several years. It is a good balsamic medicine, and is very generally used as a substitute for copaiba; but it would be more valuable as a var-

MELASTOMACEÆ.

nish: it is a preservative to wood to which it gives, with little trouble of application, a fine surface and polish, it becomes, however, white and milky if exposed to wet. It can be had at Chittagong in large quantities at 10 Rs. per mannd. It is procurable in great quantities from Manipoor, where it is used for paying river-craft and for varnishing vessels designed to contain liquids. The drug is conveyed to Silhet for sale by the merchants who come down annually with horses and other objects of trade. In Burmah, almost every article of household furniture intended to contain either solid or liquid food is lacquered by means of it. The process consists in first coating the article with a layer of pounded calcined bones, after which the varnish is laid on thinly, either in its pure state or variously coloured. The most difficult part consists in the drying. It is also much employed in the process of gilding; the surface, being first besmeared with this varnish, has then the gold leaf immediately applied to it. Finally, the beautiful Pali writing of the Burmese on ivory, palm-leaves or metal, is entirely done with this varnish in its native and pure state.—*Artillery Records with report of woods by Captains Simpson and Babington, dated Moulmein 25th May 1842. MELASTOMA MALABATHRICUM.—

Linn.

Myect-Pyai, BURN. | Malabar melastoma,
Buro-phutika, BENG. | Kandali, MALAC.

This shrub grows in the Moluccas, Sumatra, Cochin-China, Malay Islands, in both peninsulas of India, in Orissa, Jellalore, Khasyn mountains and Nepal. Its flowers are large and red; and it fruits the whole year. Its fruit is edible and is also employed for a purple dye to cotton cloths. It is one of the Black-Dye Plants of Asia. The blossoms of the shoe-flower plant are used by the Chinese to dye leather black, the juice of the cashew-tree gives a black to linen, and the fruit of this melastoma affords a black dye. In the Tenasserim Provinces, this species of melastoma with large gaudy purple petals, and long yellow stamens, is a common weed. Its calyx opens like a lid, and bears a fruit which in taste and flavour strongly resembles the blackberry of temperate regions. In Bengal the same plant is cultivated as a garden flower, but it does not compare with the wild plant of Tenasserim.—*Roxb, Mason, Voigt. W. Ill.*

MELEAGRINA MARGARITIFERA,

Lam. The Pearl oyster furnishes the finest pearls and finest nacre: when secreted in the globular form it is the pearl; when on the inner walls of the shell, the nacre. The pearl oyster is met with in the Persian Gulf, Arabian Coast, the Japanese and American seas, on the shores of California and near the islands of the South seas, Bay of Bengal, Gulf of Menaar, Ceylon, and near the mouth of the Indus. Pearls are said to be artificially produced by the Chinese introducing beneath the mantle a grain of sand around which the nacreous substance is thrown. The yield of the Ceylon pearl fisheries, was

1804 £120,000

1797 £144,000

1798 £192,000

MELEAGRINA MARGARITIFERA.

The Pearl fisheries of Japan, Persia, &c. are valued at £800,000. In all these countries the pearl fishery forms an important industry.

The oyster banks off the island of Bahrein produced £240,000 and those off Arabia £350,000. The pearl mussel multiplies by means of what is technically called spat or spawn, which is thrown out in some years in great quantities, perhaps similar to the edible oyster of Britain which threw much spat in 1849, and not again until 1860 and not again up, at least to 1866. The "spat" floats in and on the water and attaches itself to anything with which it comes in contact, attaining it is said the size of a shilling in six months. In its seventh year the pearl mussel attains its maturity as a pearl producer, pearls obtained from a seven year mussel being of double the value of those from one of six years of age. In mussels under 4 years, the pearls are not of any mercantile value and after 7 years the pearls deteriorate. Those from mussels of about 4 years old have a yellow tinge and the older kinds a pinky hue, but pearls of a red and even black as also with other colours are also met with: the Baghdad dealers prefer the round white pearl. Those of Bombay esteem pearls of a yellow hue and perfect sphericity while other nations choose the gems with a rich pink colour. There seem reasons to believe that the pearl mussel spat is migratory, forming colonies at places remote from the parent bed. Between the years 1732 and 1746, there was little pearl fishing at Ceylon and there were long suspensions between 1768 and 1796; between 1820 and 1828; and between 1837 and 1854 and during the last period the expenses were covered. The late Dr. Kelaart is stated to have been of opinion that the molluscs are capable of leaving their shells. In the Persian Gulf, the pearl banks extend three hundred miles in a straight line and the best beds are level and of white sand, overlying the coral in clear water and any mixture of mud or earthy substance with the sand is considered to be detrimental to the pearl mollusc. In the Persian Gulf, there is both a spring and a summer fishery and as many as 5,000 boats will assemble from Bahrein and the islands and continue fishing from April to September. The amount of money derived from the pearl fisheries of the Persian Gulf, has been estimated at £400,000. The net revenue from that of Ceylon, from 1828 to 1837 was £227,131. Each boat is manned with a crew of 23 persons, 10 of whom are divers, two divers to each stone, of which there are 5 in the boat. When fishing for Government or for a speculator, those receive three fourths

MELIA AZEDARACH.

of all the produce.—*Cornhill Magazine* August, 1866.

MELEAGRIS GALLOPAVO, See Pavo Japonensis.

MELEAGRIS MEXICANA, is the wild turkey of Mexico. It had been domesticated by the people of America before the discovery of that continent, and from it the domestic breeds have been derived. But the other wild species of America crosses with it. English turkeys are smaller than either wild species. The better known breeds are the Norfolks, Suffolks, white and copper coloured, or Cambridge. In India the breed of turkeys has greatly degenerated in size, is wholly incapable of rising on the wing, is of a black colour and its long pendulous appendages on the back are enormously developed.—*Darwin, Species.*

Poonmacoo keera,	TAM.		

The whole of this plant, with the exception of the root, boiled in oil, is supposed, on the Malabar coast, to be an efficacious remedy for preventing bad consequences from the bite of a water snake.—*Hortus Malabaricus, part 9th, page 143 in Ains. Mat. Med. p. 134.*

MELOE, a genus of the order Coleoptera, class Insecta

MELOE TELINI, Mylabris chicore,
Blistering-beetle, | Telni, HINDI
Native blister fly.

It abounds in Bengal, Behar, Hyderabad and Oudh; particularly in the rainy season, during which period, almost every where it is seen feeding on the flowers of cucurbitaceous plants. Dr. Ainslie had not met with it in

MELOLONTHIDÆ.

lower Hindustan.—*Dr. Honigberger*, p. 307. *Ains. Mat. Med.* p. 118.

MELOE TRIANTHEMA, is another species *Meloe trianthema* frequently found in fields over-run with the *Trianthema decandra* Willd. It is now much used, as a safe and efficacious epispastic. Its peculiar qualities were discovered by Dr. Adam Burt, Superintending Surgeon of the Bengal Establishment, in 1809, who first noticed the insect in fields around Muttra; it, however, abounds in every part of the Doab, and in the districts on the right bank of the Jumna.—*Ainslie's Mat. Med.* p. 297.

MELOLONTHIDÆ, under the name of White grub, one of the insects injurious to coffee plants, are included the larvæ of various Melolonthidæ, the Cockchafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodde considers the white grub to be by far the greatest enemy of the coffee trees which the planter has to contend with, as he never knew a single tree recover after their attack and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand trees of fine old coffee. Mr. Gordon used to dig up the soil at the foot of the trees and take out such grubs as he could find.

The larva of the moth called *Agrostis setigera*, is the very destructive "black grub" of the Ceylon Coffee planters. This pest is about an inch long and is most abundant from August to October. The caterpillar lives in the ground but comes out at night to feed, and is very common and injurious. They attack not only coffee trees, but all sorts of vegetables and flowers and are very destructive to gardens and in the field, as they eat every thing that is artificially raised, despising grass and weeds. They generally appear only on certain fields and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and Europe where it injures the grain and beet root crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated when it is mentioned that Mr. Nietner lost through them in one season, in certain fields, as many as twenty-five per cent. of the young trees he had put down.

There are, in India, many species belong-

MELOPHUS MELANICTERUS.

ing to the Melolonthideous or Cetoneidæ genera, interesting to naturalists, and amongst which those soft-bodied insects, Lampiris, Cebrio, Malachius, &c. are classed. See Coffee. Coleoptera; Grub.

MELON, under this English generic name, several vegetables are known, of which a brief mention may be made:

Citrullus cucurbita, Linn.

Water melon, Eng. | Turbuza, Hind.

The water melon is to be had at the same time as, and grown in a similar manner to, the *Cucumis* melo. The seed should always be preserved from the finest and richest-flavoured fruit, and is better for being three or four years old. The green melon is the finest flavoured, although many of the others are very good. The cause of melons growing finer in the sandy beds of rivers are attributed to the temperature being more equal about the roots than it is in beds in the garden, especially during the night.—*Riddell*. See *Cucumis* also *Cucumis melo*.

Cucumis dudaim.

Queen Anne's Pocket Melon, Eng.

Is a native of Persia, and produces a fruit variegated with green and orange, and oblong unequal green spots; when full ripe it becomes yellow and then whitish. It has a very fragrant vinous musky smell and a whitish flaccid insipid pulp.

Cucumis melo, Linn.

Musk melon,	Eng.	Kharbuza,	Hind.
Melon,	"	Sarda,	"
Kharbuj	Hind.	Pabiz,	"

Native of Jamaica, Persia? and Kabul? but cultivated throughout India. The rock, green, and musk melons are all sown in the Decan at the same time,—generally in beds or rivers where the soil is light and sandy. They are very seldom sown in gardens. The seed is put down in November, three or four seeds together, with as rich manure as can be procured. The plants must not be close together—a distance of from six to eight feet is generally allowed. They come in about March, and continue until the rains. In Bombay they are in season at the same time, and a second crop is grown during the rains: this is not the case in the Decan.—*Hogg, Vegetable Kingdom*. *Voigt, Hort. Suburb. Calcutt*: *O'Shaughnessy, Beng. Disp. Herb. Flor. Ind.* *Riddell's Gardening*, *Jaffrey's Hints to Amateur Gardeners*.

MELON SEED OIL,

Pitcha Pusghum yennai, Tam.

is obtained from the *Cucumis melo*. See Harbooza, Khurbooza, Oil.

MELOPHUS MELANICTERUS, the gaura finch, frequents fields and cultivated localities.

MEMAN.

MELVILLE ISLAND, See Saxifraga stenophylla.

MEMAN, a corruption of the Arabic word "Momin" (a true believer), was probably given to the people that go by the name now, when they were converted from hinduism to be mahomedans. The word, in its fullest signification, is applied to two distinct races of people; to the Khwajah tribe, and to the Meman Sayyat (i. e., "green," from the Sirdhi sawo), or Achihra (white), who are followers of Abn Hanifeh. Many Meman are settled in Sindhi, especially about Hyderabad, Sehwan and Kurrachee. Cutch is probably their original country, as large numbers of them are still found there. In Sindhi they are employed chiefly in agriculture and breeding camels. Their dress is that of the common Sindhi, except that they frequently shave the head, especially when old, and wear the turban, sometimes, though rarely, they adopt the peculiar Sindhi hat. They have produced many very learned men; and have done much to introduce the religious sciences into Sind'h. The tribe merits some notice, as it has either abandoned or never adopted the practice common among their brethren in Bomlay, viz., that of depriving the females of their pecuniary rights in wills and inheritances. Among the Meman, the widow and daughter are provided for according to the Koran. Their Pir, or holy men, are the family called Rashid Shahi (descended from one Mohammed Rashid Shah), or the Rohri-wara Sayyids, remarkable for nothing but excessive polygamy. Rashid the founder of the house, took unto himself thirty-two wives (instead of four, and justified the practice by the usual sophistical arguments of the Sufi order to which he belonged. The Sindhi divines pronounced his tenets to be heretical, and his conduct damnable. The Meman, however, did not object to it, and still reverence his descendants. The Meman in Sindhi has his own handwriting character; in Cutch, he uses the Guzerattee. Altogether the Meman are a respectable race; though, like the Jews, they have acquired a bad name by their rapacity in dealing with strangers, and "Wadhio Meman" (a great Meman), in Sindhi means a miserly usurer.

In the Kurrachee district, they take their tribal names as given below, principally from their original places of abode. The Khwaja are of the shiah sect and call themselves followers of Khwaja Suliman, Farisi. Their tribal names are

Akhoond	Hudokut	Khebrana
Bandroo	Katiyar	Khwaja

MEMECYLON CAPITELLATUM.

Kussabi	Patoli	Surha
Joosi	Puggir	
Mirzapori	Quazi	

—*Burton's Sindh*, p. 247-48. See Mehman. Mahman, India, Mahomedan.

MEMARARI, HIND. *Rhamnus purpureus*.

MEMBU the capital of the Abor people, on the borders of Assam.

MEMECYLACEÆ.—*Lindl.* an Order of plants comprising 1 genus, 2 species, viz., 2 *Memecylon*.

MEMECYLON, a genus of plants of the East Indies, shrubs or small trees, *M. connatum*, is a small tree of the Central Province of Ceylon at an elevation of 3,000 feet. *M. ellipticum* also a small tree in the forest between Galle and Ratnapoora at no great elevation. *M. Gardneri* and *M. leucanthum*, small trees grow at a height of 2,000 to 5,000 feet in the Central Province. *M. ovoideum*, in Ambagamowa: *M. orbiculare* at Hinidoon Corle. *M. parviflorum*, in the Central Province at 7,000 feet, *M. rhinophyllum* and *M. rostratum* small trees at 3,000, and *M. sylvaticum*, is common in forests at an elevation of 4,000 feet. *M. angustifolium* W. Lc. is common on the banks of Ceylon rivers, up to an elevation of 2,000 feet, *M. fuscescens*, *Thw.* occurs in Ceylon at Kokool Corle, at no great elevation. *M. macrocarpum*, *Thw.* a small tree, occurs in Ceylon at Ambagamowa, at an elevation of about 3,000 feet. *M. revolutum*, *Thw.* foliis coriaceis, has leathery leaves and occupies Rambodde 5,000 feet. *M. umbellatum* *Burm.* called Coracaha by the Singalese is very abundant, up to an elevation of 2,000 feet. *M. varians*, *Thw.* of the Ceylon Central Province, at an elevation of 2,000 to 5,000 feet. There are two varieties. *M. Wightii*, *Thw.* *M. amplexicaule*, also a small tree of the Central Province, at an elevation of 3,000 to 4,000 feet.—*Thw. En. Pl. Zeyl.* pt. II p. 110-111. *Wight Icones*.

MEMECYLON AMPLEXICAULE.—

Roxb.
M. cordatum, Wall. | *M. depressum*, Benth & Rheede.
Nidam shetti. MALACAL.

A flowering shrub in the forests of the W. Coast of India, used in medicine.—*Useful Plants*.

MEMECYLON CAPITELLATUM, Linn.

M. edule.—*Roxb. Corr.*

Welli-kaha, Sison. | All-chettu, Tal.

A plant of Ceylon and Coromandel, with small blue flowers. Its ripe berries, Aali Pundoo, are eaten by the natives. It is a small bush, common in most jungles on the Coromandel coast, it has much pulp of a bluish color, and of an astringent quality.—*Ainslie*, p. 221. *Thw. En. Pl. Zeyl.*

MEMOKA.

MEMEYCYLON CORDATUM, Wall. and M. depressum, Benth. *Rheede*, Syns. of M. amplexicaule.—*Rozb.*

MEMEYCYLON RAMIFLORUM. Lam.

Momecydon tinctorium. KEN, WILDE.

Anjun,	BOM.	Kana-yavu	MALEAL.
Myon-kha-tanyet	BURM.	Diedh-gaha	SINGH.
Anjunco	DUK.	Kasha maram,	TAM.
Iron wood tree,	ENG.	Kasa cheddi,	"
Anjuna	MAHR.	Kayam puva cheddi	"
Kurpa	"	Alaka chettu;	TEL
Surpa	"	Allichettu,	"

This occurs in the Malaya Peninsula, Tenasserim, Coromandel, Malabeshwar, Kandalla along the Western Ghats, in the woods about Cochin, common in jungles in the Carnatic Silhet. The flowers are small, blue, its leaves are used in dying yellow. The wood is brought into Madras for firewood and a large quantity of the leaves are imported daily for dyeing purposes. Cold infusion of the leaves imparts a yellow dye. Crimson dye is also said to be obtained from them. It is a highly ornamental tree with deep green shining leaves: flowers in February and March, of a purple colour, with the calyx beautifully streaked on the inside; it is called the Ironwood tree. It bears its flowers in compound corymbs, which contrast favourably with its shining green leaves. Dr. Gibson writing from Canara and Sunda, says, M. tinctorium; Surpa, Makr. Iron wood of two species; wood very tough and strong for cart axles, &c. The beautiful flowers extensively used as a dye. Writing of the forests generally he says M. tinctorium, "Kurpa," "Anjuna." A tree of rather small size; common on the ghats above; not seen elsewhere. Wood is very strong and tough. Does not yield readily to wet. Is much employed, when procurable of sufficient size, for agricultural implements, cart-furnishing, &c.—M. C. C. M. E. J. R. Drs. Mason. Gibson.

MEMNON, according to Hesiod and Pindar, was king of Ethiopia. Æschylus said he was son of a Cissian woman and Herodotus and others say he founded Susa and led a combined army of Susavians and Ethiopians to the assistance of Priam his father's brother and perished in one of the battles before Troy. The Egyptians claim him to be their king Amunoph iii., whose statue became known as the vocal Memnon. Memnonia, was the name of several towns in Egypt and at Susa, supposed to have been built by Memnon, and there was a tribe of Memnones near Meroe.

MEMOKA. HIND. of Kangra, Marlia begonifolia.

MENADO.

MEMPHIS. The city of the Pharaohs. Misr, the town of old Cairo, near Cairo, was built out of the ruins of Memphis.

MEM-SAHIBA. ANGLO-HINDI. An English woman, mistress of a house.

MEN. BURM. A Burmese title bearing an ambiguous meaning, applied equally to the king of England, the Governor General of India, to the king of Burmah and to all the high dignitaries of his provinces.

MEN. CHIN. Literally, gate, is often used in Chinese to designate a religion. Thus King-Men, the Luminous Gate, is the synonyme of Luminous Religion, and in the monument of Si-ngan-fou, is used for christianity.—*Huc's Christianity*, Vol. I. p. 52.

MENA. See Kali. We are led to Greece by the Aswini, and to Latium by Mena or Menaca whose legendary springing from Indra seems at least (etymologically also) to identify her with Minerva springing from Jupiter.

MENADO The tongue of land in the north of Celebes, known administratively under the name of the Dutch residency of Menado, comprehends all the northern extent of the island, from the bay of Palos in the west, to the cape of Taliabo in the east, and comprises the great bay or arm of the sea of Ganong-tello, which stretches in a westerly direction between the two peninsulas. The Dutch residency of Menado includes under its jurisdiction, the whole federative states of Minahassa; the small kingdoms of the northern coast; the very extensive districts in the west part of the peninsula, where government exercises sway, besides the islands of Sanguir and Talaut to the north as well as the lesser islands of the west coast and the large gulf of Tomini. The population is composed of Native Christians, Malays and Chinese. In 1850 there were reckoned in Minahassa a total of 178,272.

Natives	- - -	78,700	Freed Slaves	-	500
Christians	- - -	5,687	The districts of		
Malaya	- - -	2,875	Gorontalo	-	50,000
Chinese	- - -	510	Sanguir and Talaut		
			islands	-	40,000

and this without taking into account the number of the Alfoua population of the interior, which cannot be very considerable, seeing that the elevated and woody parts of Kayeli, Toradja and Tomeiku appear to be thinly peopled. The Minahassa confederation in the north of Celebes counts 286 villages; the principal districts are Tondano, Langoang, Kakes, Temehon, Sonder, Kawakkoang, Tompasse, Amurang, Belang and Kema. They are all under the direct authority of the Dutch Government; the resident and three other Eu-

MENADO.

ropean civil employes, assisted by an indeterminate number of native functionaries, administer the government. The resident is under the orders of the Governor of the Moluccas, the head quarters of which is Ambogna. Near Menado is a race called Binteke, strong, but intractable, who have hitherto resisted all efforts to improve them. There are some of the less civilized tribes which have semi-Papuan features and hair; while in some villages, the true Colebes or Bugi physiognomy prevails. The plateau of Tondau is chiefly inhabited by people nearly as white as the Chinese, and with very pleasing semi-European features. The people of Siau and Sanguir much resemble these, and Mr. Wallace believes them probably to be immigrants from some of the islands of North Polynesia. The Papuan type will represent the remnant of the aborigines. The languages contain a Celebes Malay element, and a Papuan element, along with some radical peculiarities derived from the Siau and Sanguir islands further north, and therefore probably derived from the Philippine Islands. Celebes, on its eastern coast, is fronted by islands, and many islands are scattered over the bays of Tolo and Tominiu, or Goonong Tella. Celebes, on its north coast, is in general high, bold land. Its extreme point is called Cape Coffin, and the whole of the islands that stretch from it to Menado Bay are sometimes called Banca islands.

Sanguir, and the numerous islands of this group occupy a superficies of 13 square leagues; the Talaut and the Meangis islands united are 18 square leagues; these archipelagos, formerly subject to the authority of the sultans of Ternate, now make part of the Residency of Menado. Several extinct volcanoes, and some still in full action, are found in the Sanguir group; the devastations which they commit from time to time have often been fatal to the inhabitants. The eruption of Duwana, in 1808 completely annihilated the village of Tagalando, destroyed all the surrounding forests, and suddenly deprived the inhabitants of all means of livelihood, by the destruction of their fields. The Gunong-api causes numerous ravages in the island of Siau; its peak, 6,000 feet above the level of the sea, forms the culminating point of this group. Gunong-api covers with its base all the northern part of Sanguir-besar: this volcano has not been active since 1812, when the torrents of lava destroyed the extensive forests of cocoanut trees with which this part of the island was covered, and caused the death of many of the inhabitants. These islands furnish more than twenty-five kinds of wood

MENCIUS.

suited for building and furniture. Two harbours, sheltered from all winds, exist in the larger Sanguir, one in the Bay of Taruna, the other, called Midelu, on the eastern side.—*Journ. Ind. Arch. for Dec. 1850, page 764. Horsburgh. Wallace Archipelago.*

MENAM or SIAM RIVER, the entrance of this is in lat. $13^{\circ} 30' N.$, long $101^{\circ} 15' E.$, it falls into the sea by several branches. Menam Bar-Anchorage in four fathoms. lat. $13^{\circ} 24' 50'' N.$, long. $100^{\circ} 36' 30'' E.$, The entrance to the Menam river in four fathoms is placed on Admiralty Chart fifty two miles too far east. The town of Bangkok is 27 miles from its mouth, on an islet, in lat. $13^{\circ} 58' N.$ long. $100^{\circ} 34' E.$ *Bowring's Siam. Vol. I: p. 30. See India, Karen, Yuthia or Juthia.*

MENANDER, one of the Greek kings, an Indian conqueror. Of all the kings who followed Eukratides, Menander and Apollodotus alone are mentioned by classical authorities. See Bactria. Kabul.

MENANDER a Phœnician, was in Tyre, soon after the Macedonian conquest.

MENANGKABAU. A state in Sumatra the original country of the Malay race. Menangkabate States lie between Malacca and Salangor, on the one side, and Palhang on the other.—*Journ. Ind. Archipel.* See India, Jaknn, Sumatra.

MENCIO — ? See *Gracula religiosa*.

MENCIUS. In order to get a distinct general conception of the Chinese philosophical literature, two epochs must be specially kept in mind. The first began with Confucius (Kung-fu-tsze), who was born B. C. 551 and ended with Mencius (Mang-Tsze), who died about B. C. 317. The second began with Chow-leen-ke or Chow-tsze who commenced his labours about A. D. 1034, and ended with Choo-ke or Choo-tsze, who died in A. D. 1200. The first epoch lasted for seven generations. It was separated by an interval of thirteen hundred years from the second, which lasted for five generations. Both were periods of revival of ancient learning and of further development. Both embraced several celebrated philosophers, besides those mentioned, but in each case it was the originator and closer of the epoch who became most celebrated. The writers of the second epoch are often mentioned as the philosophers of the Lung dynasty; which later was established in A. D. 960, about 70 years before Chow-tsze's labours began, and continued in possession of the sovereignty till A. D. 1271, till about 70 years after Chow-tsze's labours closed. Confucius, though his name in the West became identified with Chinese learning, was by no means its originator.

MENDA.

Authentic though not full records embodying ethical and political doctrines, extended back to B. C. 2357, or to about eighteen hundred years before Confucius, while the Chinese philosophy originated with Fuh he, who lived according to tradition, some twenty-three generations before the exact chronological era; which latter took place B. C. 2637 with the institution of the national cycle of sixty years. Allowing thirty years to a generation, this would place Fuh-he about B. C. 3327. It was he who substituted writing for the knotted strings that had previously formed the only means of record; and it was he who first established marriages, and separate families. To him are also ascribed some civilization labours of lesser, but still great importance, the division of the day into twelve she shin, or watches, of two hours each. Fuh-he is therefore the founder of Chinese civilization generally. But he is perhaps best known as the originator of the natural philosophy, and in particular as the author of the "Eight Diagrams," which were drawn by him as follows:—

The multiplication of these eight diagrams by themselves produced sixty four doubled diagrams such as:—

—See China.

MENAVAN, MALEAL, pronounced also Menon, corruptly Menowar. The village or district accountant in Malabar, according to some the appropriate designation of a sudra, according to others, of a Nair writer or accountant.—*Wilson's Glossary*.

MENDA, a river of Banka island.

MENDICANTS.

MENDAI YAGHIA, See Sabi.

MENDA-SINGI, HIND. *Nerium grandiflorum*.

MENDIEEE, HIND. *Henna*, *Lawsonia inermis*. Its leaves are used as a dye for the beard and hair, and for fingers and for horses' tails: they are also given to goats and sheep, &c., when attacked by itch.—*Powell's Handbook*, Vol. I. p. 452.

MENDIII, HIND. a mahomedan bride's paraphernalia.

MENDICANTS are very numerous in India. Amongst other hindu mendicants are the Vaishnava; Biragee, Saiva; Sanyasi, Ramanaya or worshippers of Rama; Nanuck Pantheo followers of Nanuck; Kaveer Panthee; Sukhee Bhavn; Khelanta Yogee; Kann-pala Yogee; Shurevuree; Ughorn Pant'hee; Bramhacharee, &c. &c. They have their various forms of ansterities. Of hindoos who embrace a life of mendicity; Mr. Ward was informed, that scarcely less than an eighth part of the whole population abandon their proper employments, and live as religious mendicants by begging. Supposing that there are sixteen millions of hindoos in Bengal and Behar, and that each mendicant requires only one rupee monthly for his support, not less than 2,000,000 rupees, or 250,000 pounds sterling are thus paid annually to persons, the great majority of whom are well able to support themselves by manual labour. Many of the more enlightened hindoos, and brahmins, hold these mendicants in the utmost contempt, and would consider their being compelled to work as a great blessing conferred upon the country.

The Abdhut, is a hindu mendicant, of the Vaishnava or saiva sect. The term is from the Sanscrit avadhuta and this class are supposed to have shaken off the trammels of humanity.

The Akas-mukhi, from akas, the sky and mukha the face, are religious, ascetic mendicants, among the hindoos, who hold up their faces to the sky, till the muscles of the back of the neck become contracted and retain position.

The Atit, religious mendicant, is usually a vaishnava.

Gosain mendicants worship Siva in the form of the lingam, Sanyasi worship Vishnu, Sanyasi mendicants the ancient ascetics Viragi are followers of Ramannj.

Mendicants carry water from the Ganges to a great distance. The four orders of hindu life are not now given effect to. The Bhiksuna the mendicant, of the fourth order, may now have a wife and family, *Wils. Glos.*

MENIAN.

MENDIKI JOGI, See Jogi.

MENDO, a river of Sumatra, Selan a river of Sumatra.

MENDONI, MALEAL. *Gloriosa superba*, Linn.

MENDORO, near this island, the sea is so clear and transparent that the spotted corals are plainly visible under 25 fathoms water. See Mindoro.

MENDOZA ISLAND, lies on the south coast of China.

MEND PHAL, HIND. *Randia dumetorum*.

MENDRU, also Bau-mendu, HIND. *Dodonaea burmanniana*.

MENES. The first man who reigned in Egypt was Menes, or Mena, the Eternal, whose name would seem to prove that he was not wholly withdrawn from the region of fable; from him the later kings boastfully traced their lineage. According to the Egyptian chronologists, he came to the throne about fifteen hundred years before the Persian invasion, that is to say, two thousand years before the christian era. The accepted date is B. C. 3623. He was probably the Menu of the hindoos, their first of created beings, and holiest of law-makers; and at the same time the Minos of the Greeks, their earliest law-maker and their judge of the dead.—*Ward's view of the Hindoos*, Vol. II. p. 201.—*Calc. Myth. Hind.* p. 389. *Burton's Escepta* pl. 2. *Herodotus* lib. ii. 145., in *Sharpe's History of Egypt*. Vol. II. p. 9.

MENESHENA, CAN. Cayenne Pepper.

MENESPERMUM FENESTRATUM, *Gertr.* Syn. of *Coscinium fenestratum*, *Colob.*

MENG-BA, or Ming-ba, BURM. In Amherst, a timber used for house posts and rafters. The wood looks like a kind of saul, and would answer all the purposes of that wood.

MENG-DONG, the sacred stone monuments of Tibet. On each of its ends, are inscribed the words Om Mani Padmi Hom. Oh! the jewel of the Lotus, or oh! the jewel on the Lotus, or Hail to him of the lotus and jewel.

MEN-GU, BURM. *Garcinia mangostana*, Linn.

MEN-GU, BURM. *Elaeagnus conferta*, also *Garcinia mangostana*, Linn.

MENHIR, a standing stone used as a monument to the dead. See Cairn, Kassiab, Khassyah.

MENI, a goddess of the Babylonians and Canaanites. She was the goddess of Fate, and was worshipped along with Gad, the god of destiny. *Bunsen*, iv. 253.

MENIAN, JAV. Benjamin.

MENTHA.

MENIKA TIGE or Bhu sarkara Tel. *Niebuhria oblongifolia*, D. C.

MENISPERMACEÆ. D. C. The *Cocculus* Tribe of plants comprising 12 Gen. 59 species viz., 1 *Anamirta*; 3 *Clypea*; 1 *Cyclea*; 35 *Cocculus*; 1 *Epibaterium*; 1 *Pselium*; 2 *Gynostemma*; 8 *Cissampelos*; 1 *Stephania*; 4 *Phytocrene*; 1 *Natsiatum*; 1 *Coscinium*.

MENISPERME HERSUTÆ, FR. *Menispermum hirsutum*.

MENISPERMUM COCCULUS, *Cocculus Indicus*, Linn. also *M. monadelphum*, *Roeb.* and *M. heteroclitum* *Roeb.* Syns. of *Anamirta cocculus*.

MENISPERMUM CORDIFOLIUM, *Willd.* and *M. glabrum* *Klein.* Syns. of *Cocculus cordifolius* D. C.

MENISPERMUM CRISPUM Linn. also *M. verrucosum* Syns. of *Cocculus crispus*, D. C.

MENISPERMUM FENESTRATUM of *Gertr.* Syn. of *Coscinium fenestratum*, *Colob.*

MENISPERMUM HIRSUTUM, Linn. also *M. myosotoides* Linn. and *M. villosum* Lam. Syns. of *Cocculus villosus*, D. C.

MENISPERMUM PALMATUM, Syn. of *Cocculus palmatus*.

MENISPERMUM PELTATUM, Lam. Syn. of *Clypea Burmannii*, W. & A.

MENJITH, HIND. *Rubia tinctorum*.

MENJOGI, MAR. A class of Jogi mendicants in the Maratha country, worshippers of Bhairava. *Wils. Gloss.*

MENSCHEN HAAR. GER. Human hair. MENSAME RAUCHER, GER. *Menispermum hirsutum*.

MENSULAR or Massular Island, in lat. 1°2' N., on the west coast of Sumatra, is high, and about 12 miles long, east and west.

MENTA ROMANNA, FR. Mint.

MENTA-SOPPU also Mentia, CAN. Fennugreek seed.

MENTAUS and "Jumberit," a tree of Java the wood of which is white and fine grained, and is used for inlaying, also for furniture and cabinet work.

MENTHA.

Nana,	AR.	Podinab,	HIND.	PERS.
Ba-di-na,	BURM.	Jia manis,		Malay.
Podina,	DUK.	Widda,		TAM.
Mint,	ENG.			

Several of the mints, *Mentha sylvestris*, *M. viridis*, *M. piperita* and *M. arvensis*, remarkable for their odour and taste, have long been used in medicine and some, as *μινθα*, *ἡ μένθος* and *καριφθα* of the Greeks, *ana* of the Arabs

MENTHA VIRIDIS.

as sweet herbs; but it is difficult to distinguish one species from another by the short descriptions given.

MENTHA INCANA. Willd. Persian mint.

MENTHA PIPERITA, the Peppermint, grows in Europe, Asia, N. Africa and America. Its aroma is almost destroyed by drying. The essential oil is greenish yellow and very liquid; after long keeping, it deposits crystals of camphor; it is often adulterated, especially with the oils of congenerous species, a fault almost impossible to detect. The essential oil is a very valuable stimulant, and is especially useful in flatulent diseases, and in the early stages of malignant cholera. It is a deservedly great favourite in the nursery. Dissolved in spirit, it constitutes the tincture or essence: distilled with water, it forms the peppermint water of the shops. *O.Sh.* p. 489.

MENTHA PULEGIUM, or Pennyroyal, is found in wet ditches in most parts of Europe, also in the Caucasus, Chili, and Teneriffe.

MENU. The Menu of the hindus are seven; Swayambhuva (who by some is termed an incarnation of Brahma,) Swarochesa, Utoma, Tamasa, Raivata, Chaishusha, and Satyavarata. Sir William Jones has considered Swayambhuva to have been Adam, and Satyavarata, Noah. The Institutes of Menu were composed at least 800 but probably 1280 years before Christ. Menu's Institutes are later than the Vedas, and show the legal, social and political rather than the poetical and religious aspects of brahmanism. Many of his dicta by no means tend to elevate the condition of women. In his lengthened catalogue of things pure and impure he, however, says, the month of a woman is constantly pure, and he ranks it with the running waters, and the sun-beam; he suggests that their names should be agreeable, soft, clear, captivating the fancy, auspicious, ending in long vowels, resembling words of benediction. Where females are honoured, he says, there the deities are pleased; but where dishonoured, there all religious rites become useless: and he declares, that in whatever house a woman not duly honoured pronounces an imprecation, that house, with all that belongs to it, shall utterly perish. Strike not, even with a blossom, a wife guilty of a hundred faults, says another sage: a sentiment so delicate, that Reginald de Born, the prince of troubadours, never uttered any more refined. Menu lays down some plain and wholesome rules for the domestic conduct of the wife; above all, he recommends her to preserve a cheerful temper, and frugality in domestic expenses. Some of his texts savour, however, more of the anchorite than of a person conversant with mankind; and when he commands the husband to be revered as a god by the virtuous wife, even though enamoured of another woman, it may be justly doubted if ever he found obedience thereto; or the scarcely less difficult ordinance, for a whole year let a husband bear with his wife who treats him with aversion, after which probation he is permitted to separate. *Tod's Rajastham, Vol. I. p.* 611. *Cole.*

MERASI, ARAB. A revenue term introduced into India by the mahomedans; it means "that which is inherited," and seems to have been substituted for the Tamil term Kaniachi, or right of ownership by inheritance. The term mirasidar corresponds to that of the Tamil Kani-achi-karan, and means a person exercising merasi rights. Supposing that the rights and claims of the merasidar on one side, and the asserted hardship, &c. of the Poyacari on the other are recognized, then the subject for inquiry will be what system of revenue administration will

MERASI.

best insure an augmentation of public revenue, by affording greater facilities for the Poyacari, to cultivate, without interfering with the existing privileges of the merasidar. The merasidar will never be induced to forego their rights without a considerable compensation being paid to them. The success of the merasi system in a very great measure depends upon the saleable value which grows on the land; and so long as the latter exists, the former cannot be annihilated. Poyacari who have become merasidars by purchase or other engagement, will not concede their rights. Every individual will seek to rise in society, and every Poyacari wish to become a merasidar when a favourable opportunity occurs. Permanent puttas, one for each share of the merasidars should be issued, by which, whether the lands are cultivated or not, the fixed assessment will in any case be collected under pain of immediate sale. These putta are to cover the extent of land according to the different shares of the merasidars, inclusive of both the cultivated and waste. So that the whole ayacut or acreage of a village, exclusive only of the bona fide Purnimboko or sites for tanks, pasture, &c. will be brought under realizable assessment. This assessment should be subject to no fluctuation, but may change hands by purchase, gift, or other transfer. It ought, however, not to be so heavy that Government should constantly come under the necessity of consigning the land to public auction or purchasing it themselves. Under these conditions each merasidar will be willing to keep only so much of the land as he is really able to manage, and dispose of the rest at the current prices. The Poyacari will have thereby an ample opportunity to avail themselves of becoming proprietors. Labor will become dear and prove advantageous ultimately to the Poyacari. Such permanent tenure would induce many an individual to acquire lands, and thereby enhance the value thereon. The merasidars would part with the excess under such circumstances, rather than pay for it for years without an adequate remuneration.

The present assessment generally on the cultivated lands of the South of India, is by no means exorbitant. But it would prove oppressive if the assessment on "waste" be made leviable in full.

Any scheme introduced should avoid on one side the evils of the ryotwary system which tends to reduce the holdings to an inconsiderable and undesirable size, and obviate on the other the necessity of often falling in arrears as has been the case with permanently settled Mootas. A "Khandam-

MERCARA.

war Ryotwar" settlement will bear a strong resemblance to the estates of Malabar, the result of the most successful of revenue systems and will have the advantages of having at hand a body of independent affluent landholders in the Presidency District, from which at any time may be had gentlemen to aid our Legislative Councils with their advice and fortune when needed.

MERCANDEYA, PURAN. See Lakshmi.

MERCARA, the capital of Coorg, captured by the Madras Army on the 6th April 1834. The town is beautifully situated in almost the very centre of the country, and is 4,500 feet above the sea level. A regiment of native infantry is always quartered in Mercara, in a fort which was formerly the rajah's palace, and which is a very spacious and substantial building. It is supposed to have been built for the rajah by an Italian, who is said to have been bricked up in a wall as soon as the building was finished. Verajenderpet a town of Coorg, is situated on the road leading to Cannanore from Mercara, and is 20 miles from the latter place. There is a cross road from Mysore which joins the road to Cannanore a few miles below Verajenderpet, and along this road passes all the direct traffic between Mysore and the coast.

Fraserpet, another Coorg town, is situated on the road to Mysore from Mercara, and it is also 20 miles from the latter place. The river Cauvery runs past Fraserpet, and forms the boundary between Coorg and Mysore. The S. W. monsoons, which always rages throughout Coorg from June to November, is scarcely felt at Fraserpet, and on this account the European and Native officials reside there during the wet season, returning to Mercara as soon as the monsoon ceases. Situated at from 3,000 to 4,000 feet above the sea, but in close proximity to that element, and always swept, owing to its position at the crest of the Ghauts, by a fresh and invigorating breeze, there is not a pleasanter district in India than Coorg. The Coorg insurrection necessitated the construction of a first class road between Bangalore and Mangalore, and Mercara happened to be the spot chosen for the head of the pass over the Ghauts. It was for a lengthened period the Head Quarters of the Corps of Sappers, as its mild and temperate climate peculiarly adapted it for the training of that body in field fortification; it has since been garrisoned by a regiment of Native Infantry. Coorg became one vast coffee plantation, and estates were vigorously cleared wherever they abutted on the road, by which produce could alone be carried off and coffee became very extensively cultivated in Coorg. There

MERCURY.

are five districts:—viz: at and near Verajenderpet on the Cannanore Ghat. The dry district, including Ahtoor, Setapoor, and Santa Coopa. At and near Mercara. An outlying district about eight miles from Mercara; and near the Canara boundary. There is no town or village in this district. And the Ghat leading to Mangalore from Mercara.

There are, besides, two other districts containing immense tracts of forest land. They are Nacknaad and the Beammagberry range. The former is situated between the Mangalore and Cannanore Ghats, overlooking Malabar, and the latter range forms the boundary between Coorg and Wynaad.

MERCHANT. A great part of the town residents of British India follow mercantile pursuits. Many mahomedans, of Arab and hindu descent, as the Mopla, the Labbi, the Borah, the Mehman, are active merchants. The Parsi race are extensively engaged in commerce. The Baboon of Calcutta, chiefly of Sudra origin, are also great merchants. The Chettyar of Madras, all of them Vaisya hindoos, are also largely engaged and there are eighty tribes of Rajputs engaged in commercial transactions.

Parah,	GUZ. HIND.	Rasani,	TAM. TEL.

Mercury or quicksilver was known to the ancients. The Romans seem to have employed it as a medicine externally as did the Arabs; but the hindus were probably the first to prescribe it internally. It is found in China, at Almaden in Spain, at Idria in Carniola, and likewise in South America. It occurs occasionally in metallic globules; usually as the native bisulphuret or cinabar, combined with silver, forming a native amalgam; or with chlorine, as in Horn Mercury. It is chiefly obtained from the sulphuret by distillation with lime or with iron, which combining with the sulphur, the metal distils over and is condensed. Quicksilver, or native mercury, is said to be brought to Ava from China. The following substances are compounds of mercury, viz:—

Bichloride of Mercury.

Hydrargyri bichloridum	Corrosive sublimate.
LAT.	Oxymuriate of mercury

MERDIN ROCKS.

Doppelt-chlor queck-	Bi-chlorure de mercure.	Fr.
silber,	mercure,	Fr.
GER.		
Rus-capoor, Guz. HIND.	Sublime corrosif.	"
TAM.	Deuto-chlorure de mer-	Fr.
	cure,	Fr.

This is white, with an acrid metallic and persistent taste, without smell. It is met with in small crystals, or in semi-transparent masses. Corrosive sublimate is made in many parts of British India, and seems to have been long known to, and prepared by the natives of India.

Chloride of Mercury.

Hydrargyri chloridum,	Proto-chlorure de	
Chloride of Mercury, ENG.	mercure,	Fr.
Calomel, ENG. LAT.	Mercuré doux,	"
Proto chloride of mercury	Einfach chlor-queck-	"
Submuriate of mercury, "	silber,	GER.

Several preparations of mercury have been described by the Sanskrit and Tamil writers, especially in the "Purana Sastham," a work on Materia Medica and religious observances. Dr. O'Shaughnessy examined the processes and found that they generally led to the production of a mixture of calomel and corrosive sublimate and the analysis of all the bazaar preparations he collected, showed their composition to be a mixture of varying proportions of these substances. The raskarpur is generally considered to be corrosive sublimate, but on analysis he found that it is usually calomel. Once, however, he met a specimen which was corrosive sublimate of the finest kind. The cause of the uncertainty is to be traced in the different portions of the ingredients recommended by different native writers, and which of course must lead to the results described.

Russaspasum is a sort of muriate of mercury, in great repute amongst the Tamil people, and which appears to be administered by them in larger doses than any other preparations of this metal. But it generally happens that through defective manipulation a mixture of calomel and the bichloride is formed.

Shavirum is a strange compound administered by the Tamils in very small quantities; and it ought to be so, as it is evidently a harsh, uncertain, and dangerous preparation. In the mode of preparing it, the vapours of calomel simultaneously rising and meeting the chlorine are converted into the bi-chloride of mercury. *Drs. Mason—Royle. Beng. Phar. p. 342. Revd. E. P. Smith.*

MERDIN ROCKS are at the Baghdad frontier towards Constantinople. The pa-

MERESINGHA.

shalik of Baghdad extends from the Merdin Rocks to the mouth of the Shat-ul-Arab.

MERDUI, a Brahui tribe of shepherds living near Khozdar, who obtain antimony and lead from the hills of Kapper. The lead is found native, in pieces the size of marbles, a fact extremely rare in mineralogy. In writing of Jhalawan, Dr. Cook, an officer of the Bombay Army, says the mountain range of Beluchistan is the great natural boundary of Western India, and may be described, figuratively, as composed of a vast under structure, surmounted by parallel rows of walls (represented by mountain ranges) cut through here and there by long and commanding passages. Amongst these mountains, the Merdui tribe of the Brahui obtain lead ore from many spots in their vicinity and reduce it. A place called Seman situated amongst low sandstone hills, black externally, with fragments and boulders of dark blue limestone, and arenaceous numulitic rock scattered around. Beneath the sandstone is a red, sandy clay, and in this is found red ore, carbonate of lead, in thin, flat, tabular masses looking like a broken up vein, which are covered externally with a layer of calcareous earth that prevent them from being easily detected. The place where this is found can hardly be called "mines" as the shepherds merely poke about with a stick, pick up any promising pieces, roughly estimate the specific gravity by the hand, and, if they have not the proper weight, reject them. At Khozdar the implements for reducing the lead-ore are very rude. A rough furnace with four upright square stones and a hole below to insert the nozzle of a pair of bellows:—

The following heights were obtained by the boiling point of water in the route towards Mekran and the return route;

MERDUM SIAH, PERS. *Atropa acuminata*, also *A. mandragora*, *Mandrako*.

MERESINGHA, URJA. A tree in Ganjam and Gumsur, of extreme height 30 feet, circumference $2\frac{1}{2}$ feet and height from the ground to the intersection of the first branch, 8 feet. It is tolerably common, and burnt

MERIALOO.

for firewood. The leaves are used in curry stuff.—*Captain Macdonald.*

MERGELLUS ALBELLUS, also Mergus albellus; the 'Smew' has the circuit of northern regions; W. Asia, Sindh, Punjab, Oudh; and is not rare along the Punjab rivers.

MERGUI is the most southern of the Tenasserim provinces. It is bounded on the north by the province of Tavoy, from which it is separated by the Pa-Au river: on the south by the Pak-chau river, on the east by that chain of mountains which divides Tavoy from Siam; and on the west, by the eastern waters of the Bay of Bengal. Mergui called Beit Myoo by the Burmese, is in lat. $12^{\circ} 27' N.$, long. $98^{\circ} 38' E.$ at the entrance of the principal branch of the Tenasserim River. High water at the springs occurs about $11\frac{1}{2}$ or 12 hours, when the rise is from 18 to 22 feet, Mergui possesses valuable fields of coal. The beds are very extensive, from 9 to 18 feet thick and about 16 feet from the surface. The principal mine is about ninety miles up the great Tenasserim River. It was at one time worked by Government but did not prove remunerative as is supposed from want of management. Mergui was taken 15th September 1824. Mergui Arrow-root was formerly prepared from the Tacca pinnatifida, but it was not found to agree with some constitutions.—*Horsburgh. Winter's Burma*, p. 107; See Junkseylon. Liquidamber altingia. Tin.

MERGUI ARCHIPELAGO. A chain of high islands fronting the coast of Tenasserim, extending from Tavoy island in lat. $13^{\circ} 13'$ to the Seyer islands in lat. $8^{\circ} 30' N.$ From the entrance of the Salwyn river at Amherst to the Pakchan river is an interesting chain of islands of various sizes, covered with verdure. They are inhabited by the Selong about 800 or 1000 in number, with 100 boats and they contain iron, copper and tin. Tavoy island is the largest. The islanders both of the Indian Ocean and the Pacific are Indians, Japanese or Malay. The Singalese are Indians;—the Luchu are Japanese; and the natives of Sumatra and Borneo are Malay: Hainan, is Chinese. The Mergui Archipelago and Formosa are more or less Malay. The number of the Silong or wandering fishermen of the Malay Archipelago amounts to about 1,000 souls. The western coast of Formosa is occupied to a great extent by recent settlers from China; but the interior is occupied by several rude tribes whose language differs from the known Formosa.—*Horsburgh. Latham's Descriptive Ethnology.*

MERIALOO. TEL. Piper nigrum; black pepper.

MERIAH.

MERGUS MERGANSER, the 'Goosander.' (M. orientalis of Gould.) has the circuit of northern regions: not rare in the Himalaya; rare in Central India.

MERI, See Kyan.

MERIAH, The name given to the human sacrifices in Orissa, where young persons are sacrificed to propitiate the divinity supposed to preside over the soil. The Meriah sacrifices to the earth goddess were made without hindrance amongst the Kond hill tribe of Orissa, until the close of the Goomsoor war in 1836. At this date, Colonel John Campbell, C. B., was employed to suppress them. In Boad and Gumsur, the form under which the goddess was worshipped, is as a bird, but in Chinna Kemedi that of an elephant. The Meriah were of both sexes captured in the plains and sold to the Kond by a race called Puna. In one place, there was a pit dug, over which a hog is killed and the Meriah's face then forced into the bloody mire until dead from suffocation. Pieces of the flesh were then cut off and buried beneath the village idol and in the fields of the villagers. In Boad, great value was attached to the saliva of the Meriah. A Meriah Agency was instituted for the purpose of suppressing the practice of human sacrifice in the Kond country and it has done as much as, if not more than, could have been expected in carrying out that object. The victims of Meriah are not the Kond but natives of the low countries, bordering on the Kond mountains. They were procured for the purpose, by the Kond, by a regular system of crimping and kidnapping. The Kond had also been in the habit, until they were checked by the Agency, of carrying off human beings from the plains to the hills, for the purpose of sacrifice. It may be easily supposed that with this object in view, they were not particular as to the caste of their victims. All were acceptable, from the brahmin or mahomedan, to the pariah—without distinction of age or sex. The greater number were very young children, who were purchased or stolen, carried to the hills and allowed to live till some occasion called for a sacrifice. The rescued Meriah were placed in villages of their own, on land granted them by Government and they made considerable progress in acquiring settled and industrious habits. The Kond inhabit an immense tract of mountainous country covered with dense jungle—they are a hardy and independent race—who look on human sacrifice as the only means of averting the anger of heaven. Meriah sacrifices in the hill tracts of Orissa have much decreased.

MEROOT.

The Kond have given up the practice, sacrificing buffaloes instead; but the residents of Parla Kimediy still carry on that of sacrificing children to Kali in secret. The large establishment hitherto maintained for the especial purpose has not succeeded in entirely preventing Meriah sacrifices even on shore, and on board the country ships plying in the neighbourhood of the districts where the practice prevails, they were rather the rule than the exception.

MERIANDRA BENGALENSIS, BENTH.

Kafur ka putta, HIND. | Sima karpuram, TEL.

A plant of the family of Labiatae with a camphor like smell and taste in use amongst the people of India.—*O'Shaughnessy*, p. 492.

MERIANDRA STROBILIFER. A nut-tree Hind. has a strong fragrance, and is considered by Royle as very promising—*O'Shaughnessy*, p. 492.

MERI-MAN, See Kyan.

MERINO. A fine woollen fabric.

MERINO, HIND. Potentilla inglisii.

MERJAN, PERS. Coral.

MERJEE RIVER, on the coast of Canara in lat. 14° 30' N. long., 74° 21' E. about 18 miles distant from Anje Deva island.—*Horsburgh*.

MERLETTI also Pizzi, Tr. Lacc.

MERODACH, a name of Jupiter. See Baal.

MEROE, in Lat 16° 24'. In Ethiopia, a country mentioned in the Scriptures, corresponding to the present kingdoms of Nubia and Abyssinia. It was also called Seba as also Meroc. It is named in Milton's Paradise Lost, when describing the inhabitants of the world,

* * * some from farthest south
Syene, and where the shadow both way falls,
Meroc, Nilotic isle;—

It was at one time occupied by Arabs under a settled form of government who conquered Nubia and harassed the Thebans. During the earlier centuries all these Arabs were easily conquered by the Egyptians. *Sharpe's History of Egypt*, Vol. i. pp. 104-105 See Egypt. Khadim.

MEROE, A genus of molluscs.

MEROOT, also called Idaan, a race in Borneo, who inhabit the more hilly districts towards the north, in the vicinity of Kina-Balou. They resemble the Kadyan; and some of their tribes who are near the capital are compelled to plant pepper and collect the produce. They appear anxious for an intercourse with Europeans, they are said to sacrifice human victims, like the Kyan. The Idaan, of different places, go under different denominations and have different languages

MERU.

but in their manners and customs they seem to be nearly alike. The name "Idaan" is, in some measure, peculiar to those of the north part of Borneo; the inland people of Passir are called Darat; those of Benjar, Biajoos, the Subano of Magindanao appear to be the same people; perhaps, where the aborigines, in the several islands of the Oriental Polynesia are not negroes, they are little different from the Idaan of Borneo. The Idaan are reckoned fairer than the inhabitants of the coast, this has given rise to an opinion, seemingly wholly unfounded, that they are the descendants of the Chinese; the custom obtains of arranging human skulls about the houses of the Idaan, as a mark of affluence.—*Journal of the Indian Archipelago*, No. IV Sept. 1849, p. 557. See Kyan.

MEROPS ORNATUS, the Australian Bee-eater. It sits on twigs in open places and darts at every insect it sees.

MEROPS APIASTER. The 'Bee-eater' of Europe, Africa, W. Asia, Afghanistan, Kashmir, Sind, Punjab? migratory in Europe and rare in Britain. M. *Aegyptius*, philippensis, quanticolor, and viridis, also occur in India.

MERRIENE or Marriere, in lat. 4° 19½' N. long. 132° 28¼' E. on the north-west coast of New Guinea, is about 1¼ or 2 miles in extent N. and S. and ¾ of a mile to a mile broad.—*Horsburgh*.

MERSINGI, MAR. *Spathodea arcuata*.

MERTA, See Mira Bai.

MERU. A mythological mountain of the hindoo religionists, the Mien-mo of the Burmese, and the Sineru of the Siamese. It is termed by the hindus, in their theogony, the navel of the world, and is their Olympus, the fabled residence of their deities. Siamese and Burmese describe this mountain differently. Mr. Wilford, in the eighth volume of the Asiatic Researches gives, as a specimen of the geographical style of the hindus, a translation, in the very words of the Brahmanda Purana, descriptive of this mountain. Around it are four great islands, or countries: in the middle, like the germ, is Meru, a great mountain of various colours all round, like to a lotus. Every rishi represents this lord of mountains as it appears to him from his station: Brahma, Indra, and all the gods, declare that this largest of all mountains is a form consisting of jewels of numberless colours, the abode of various tribes; like gold; like the dawning morn, resplendent, with a thousand petals; like a thousand water-pots, with a thousand leaves. A map of the world is given fancifully shaped like a lotus; the calyx forming Meru, like a bell, mouth upwards, or like an

MERU.

inverted linga. Here, on one of its three peaks, is Kailasa, the Olympus of Siva: and on another, the Swerga, or paradise of Indra, but his terrestrial abode is otherwise described as placed in the mountains of Sitanta, skirted by a most delightful country, well watered, enlivened with the harmonious noise of the black bee, and frogs. There, among immense caves, is Oridavana, or place of dalliance of Mahendra; where knowledge, and the completion of our wishes, is fully accomplished. There is the great forest of the Parijata tree, of the king of the gods, known through the three worlds; and the whole world sings his praise from the Veda. Such is the place of dalliance of him with a thousand eyes, or Indra. In this charming grove of Sakra or Indra, the gods, the Danava, the Snakes, Yuksha, Rakshasa, Gniya of Kuvera, Gandharva, live happy; as well as numerous tribes of Apsarasi, fond of sport. Meru is the station of Brahma, the sun is that of Vishnu, and Jupiter that of Siva. Gandha-madana, in hindu cosmogony, is one of the four boundary mountains enclosing the central region of the world, called Ilavritta, in which the golden mountain of the gods, or Meru, is situated. The Parana are rather at variance as to its position. According to the Vayu it lies on the west, connecting Nila and Nishada, the north and south ranges. The Vishnu Purana places it on the south, the western mountain being there called Vipala. It has, however, a Gandha-madana to the west amongst the projecting branches or filaments of Meru. The Bhagavat places it on the east of Meru. The Mahabharat agrees with the Vayu Purana. The Padma Purana is at variance with itself, and places it in one passage on the west, and in another describes it as on the east. According to this Purana, Kuvera resides on it with the Apsarasi, Gandharva, and Rakshasa. The Sita, alighting on its top, thence descends to the Bhadravarsha, and flows to the eastern sea. Meru mountain is famed in the traditions of the ancient Indians. Pamer is the country about Meru (upa-meru). Meru seems to mean strictly the terrestrial orb, or yolk of the mundane egg. In the grand epic, the Ramayana (Book i. p. 236), Mera is the mountain-nymph, the daughter of Meru and spouse of Himavut; from whom sprung two daughters, the river goddess Gunga and the mountain nymph Parvati. She is, in the Mahabharat, also termed Syoola, the daughter of Syeel, another designation of the snowy chain: and hence mountain streams are called in Sanscrit silletee. Syoola bears the same attri-

METARI.

butes with the Phrygian Cybele, who was also the daughter of a mountain of the same name: the one is carried, the other drawn, by lions. Thus the Greeks also metamorphosed Parbut Pamer, or 'the mountain Pamer,' into Paropamisan, applied to the Hindu Koh west of Bamian; but the Parbut put Pamer, or 'Pamer chief of hills,' is mentioned by the bard Chund as being far east of that tract, and under it resided Kamira, one of the great feudatories of Prithivi-raja of Delhi.—*Cole. Myth. Hind.* p. 253. *Moor*, p. 270. *Hindu Theatre*, Vol. I. p. 241. *Bunsen*, I. p. 431. *Tod's Rajasthan*, Vol. I. p. 24. *Ramayana lib.* i. p. 236. See Indra. Inscriptions. Yavana.

MERULA, the black-bird genus, of which many species occur in India, *M. brachypus*, *kinnissii*, *simillima*, *vulgaris*, *Wardii*. See Birds.

MERUT, a district and town of the N. W. Provinces of India. Its chief towns are Meerut, Alighur, Dehra Dhoon, Masuri, Landour and Saharanpur. Merut is 32 miles N. E. of Delhi.

MERV, the capital of the ancient Margiana, is said to have been founded by Alexander the Great, and became the residence of one of his successors, Antiochus Nicator, who called it Antiocha. In more modern days it was deemed one of the four royal cities of Khorassan, and was often the residence of powerful monarchs. Merv is regarded by the Persians as the spot where Adam received from the angel the first lesson of agriculture.—*Malcolm's History of Persia*, Vol. II. p. 232. See Arian, Kolat, Khalif, Kabul Jews. Margiana.

MESAKHEE. A shrubby tree, of Assam, probably a species of *Boehmeria*, and very abundant. Its young branches, which are tender and red-coloured, as well as its leaves, are edible. Its fibre is well adapted for cordage. The Marree and others might be induced to bring the fibre for sale. Large quantities of 'Mesakhee,' grow wild in Upper Mattock and elsewhere in the district. *Capt. Dalton*, in letter, dated 20th July 1851 in *Journ. Agri-Hortic. Soc.*, viii., p. 60, vii. p. 215, 24, *Royle. Fib.* p. 365, quoting *Major Hannay, Captain Thompson*.

MESALIH. AR. HIND. PERS. properly Masalih a mixture of stimulating, carminative substances.

MESAMBRIA.—See Kasr.

MESARI, Guz. A tribe of merchants and traders in Guzerat, followers of a teacher named Gosaiji Maharaj.

METARI. TEL. a headman among the lower castes, as palankeen bearers, washermen, cowherds &c. qu? Mehtari.

MESOPOTAMIA.

MESEMBRYANTHEMACEÆ, or *Mesembryaceæ*.—*Lindl.*, a natural order of plants, composing 2 genera, 3 species, viz. 2 *Mesembryanthemum*; 1 *Glinus*. *Mesembryanthemum Crystallinum* is the Ice plant.—*Linn.*

MESEMBRYANTHEMUM NODIFLORUM, at the Cape, used in making Morocco leather.

MESHA. See *Varaha*; *Mihira*.

MESHA-AB. *Ar.* There are three kinds of sticks used for driving camels; the *mesha ab* which is a branch of almond-wood cut out of the bough so as to leave an obliquely inclined head; this is chiefly but not exclusively used by the *sherif*, and as has already been said in the prince of Mecca's hand is the symbol of sovereignty; the bark is left on it entire. The *nutrak* is a longer and perfectly straight peeled wand and the *bakur*, shorter and heavier than the last, is bent round at the end; both the *bakur* and *mesha'ab* are held by the straight part. The *mesha'ab* is of immemorial use in Arabia, and is historically interesting. Such a stick must have been Aaron's rod, which "brought forth buds and bloomed blossoms and yielded almonds," a *mesha'ab* is mentioned as forming part of the scanty succession of *Mahammad*.—*Hamilton's Sinai, Hedjaz and Soudan*, p. 146, 164 and 165.

MESPIUS BENGALENSIS. See *Dyes*.

MESHAKSHI KUSUMA. *Tel.* A species of *Cassia*, *Laurus* or some other *Lauraceous* tree. The native term is invariably connected with an aromatic gum or resin. The word signifies a tree, having a flower like a "ram's eye."

MESHID is in lat. $36^{\circ} 15' 44''$ N. See *Jews*.

MESH'IA, *BENG.* Indian red sorrel or Indian *Hibiscus*, *Hibiscus sabdariffa*.

MESHTA-PAT, *BENG.* Hemp-leaved *Hibiscus*, *Hibiscus cannabinus*.

MESJID ALI, See *Mesopotamia*.

MESONA WALLICHIANA. A labiate plant that grows on the ascent of the Jynta Hills, whose bruised leaves smell as strongly of patchouli, as do those of the plant producing that perfume, to which it is closely allied. *Pogostemon patchouli* has been said to occur in the Khasia Hills of India, but Dr. Hooker never met with it, and he doubts the accuracy of the statement. It is a native of the Malay peninsula, whence the leaves are imported into Bengal, and so to Europe.—*Hooker Him. Jour.* Vol. II. p. 314.

MESOPOTAMIA. *Strabo* says that the Tigris washes the eastern side of *Mesopotamia*, and the river Euphrates its southern and western; whilst the Taurus separates it from Armenia on the north. *Pliny*, who is still more distinct, says that *Mesopotamia* has

MESOPOTAMIA

the Tigris to the east, the Euphrates west, the Persian Gulf south, and the Taurus north, with a length of 800 miles and a breadth of 360 miles, the city of Charax being at the extremity of the Gulf. *Lid.* vi, c. xxvii. *Mesopotamia* extends above 10° in longitude from Bâlis, in $38^{\circ} 7' 10''$ east longitude, to the estuary of the old Kârun, in $48^{\circ} 45' 16''$ and $7^{\circ} 21' 5''$ in latitude from the shores of the Persian Gulf, in 30° to *Sumei-at*, in $37^{\circ} 31' 5''$ north latitude; its greatest width being about 170 miles from Jaber Castle to *Han Keila*, on the Tigris, and its extreme length nearly 735 miles. The irregular triangle thus formed has a superficies of nearly 76,117 square miles, including the shores of the Gulf from the *Paliacopas* to the old Kârun. Truffles and wild capers, peas, spinach, and the enrob, *Cerastium siliqua*, are found in *Mesopotamia*. A pea called Arab addis is particularly good. The principal towns of *Mesopotamia* are *Diâr Bekr*, *Hisu Keifa*, *Jezreh*, *Môsul*, *Tekrit*, *Sâmmarâ* and *Kût-el-Amârâ* along the Tigris; *Erzingân*, *Kemâkh*, *Egû*, *Keblân Mader*, *Malatiyah*, *Râm*, *Kal'ah*, *Bîr*, *Rakkah*, *Deir*, *Rawd*, *Amh*, *Hadisah*, *El' Uzz*, *Jibbah*, *Diwâniyah*, *Lamlân*, *Sheikh el Shuyûkh*, and *Kurnah* along the Euphrates: in addition to *Saverek*, *O'fâh*, *Hâran*, *Serong*, *Ras-el-ain*, *Mârdîn*, *Nisibis*, *Sinjar*, *El Hadhr*, *Kerbelâh*, *Ma-jid Ali*, *Sammwâh*, *Zobeid*, and many other villages, both in the mountains and along the streams, between the two great rivers. *Grane*, or *Quade*, *Mohammarah*, and *Bârah* are the ports; and the last, being the principal, is next in importance to *Baghdâd*, the capital, the inhabitants consist of Arabs, *Osmâni* Turks, Kurd, Turkoman, Syrians, Jews, and Christians. Arabic is the general language; Turkish, Kurdish, Chaldee, Syriac, and Syro-Chaldean dialects being the exceptions. The sunni muhammedan religion is prevalent; but in Upper *Mesopotamia* there are many Christians of the creed of Nestorians, some of whom have become Roman Catholics,) and Jacobite as well as Roman Catholic Syrians.

The races that have ruled here have been many and from the most remote times and remnants are still to be traced of former dominant peoples in the varied languages still spoken. Professor Rawlinson believes that Chaldeæ was a part of the great *Mesopotamia* plain, bordering the Persian Gulf on the south, with Arabia on its west, and the limit between lower and upper *Mesopotamia* on the north. Chaldeæ seems to have been divided into a northern portion from *Hit* to *Babylon*, and a southern portion from *Niffer*

MESOPOTAMIA.

to the shores of the Persian Gulf. In each of these there seems to have been a tetrarchy, viz., Babel, Erech, Accad and Calneh, in the land of Shinar (Gen. x. 10) and Hur, or Hurak, Nipur and Larsa, or Larancha, which seems to be the scriptural Ur of the Chaldees, Erech, Calneh and Ellasar. The northern tetrarchy was Babel or Babylon, Borsippa, Cutha and Sippara, the last the Sepharvaim of Scripture. A Semitic or Aramaic race is usually supposed to have early occupied the great alluvial plain at the mouth of the Euphrates and Tigris. They called themselves *Aram*, and the Greeks called them Assyrians or Syrians, and Niebuhr regards the early inhabitants of lower Mesopotamia as pure Aramaeans closely akin to the Assyrians, from whom indeed he regards them as separated only politically, and this view is taken by Bunsen and Muller, but Professor Rawlinson (i. 54) regards as correct, the scriptural statement that they were Hamites, Cushite or Ethiopians. The first Babylonish dynasty began B.C. 3784, by a powerful Chaldee kingdom in Southern Babylonia and the historical city of Babylon is supposed to have been built B.C. 3250. The Chaldean Dynasty lasted for 1550 years, till B.C. 2234, when Babylon was taken by Zoroaster, a Mede, who then founded there the second Babylonian dynasty. The Median dominion ended B.C. 2011, after a rule of 224 years. The Chaldees were on several occasions the dominant race. The term Chaldaea, is derived by Pocock from *Kula* a tribe and *deva* god or *brahmin*. Chaldaeans were undoubtedly the first people who dwelt in cities and formed a nation in the south of Persia. They settled in Mesopotamia, but it is supposed that they originally came from near Ararat and that they had spread northward towards the Caucasian range, where they engaged in astronomical pursuits.

The temple of Belus, the sun-god of the Babylonians, in the city of Babylon, was built about B. C. 3500 or B. C. 3250, in the era of the largest pyramid, but five centuries before the pyramids generally. This temple was built many thousand years after, and was quite distinct from, the watch tower mentioned in Genesis. The temple of Belus, was in the centre of the city of Babylon and was the vastest monument in Babylon and the world, and seems to have been erected 323 years before the birth of Abraham. It was a temple but also meant as the watch tower of Babylon. On the Euphrates, about 70 miles below Hit is the modern castle of Felujah, situated 29½ miles W. 2° N. of Baghdad. The average width in this part of the river de-

MESOPOTAMIA.

creases a little, being only about 250 yards with an ordinary depth of 20 feet; and there is a current of less than two and a half miles per hour in the flood season, when the river forms thirteen islands, without wood. Above Felujah, at 5½ miles S. 60° W. from it, the derivation, called the Saklawiyah, takes place; this stream crosses Mesopotamia by a tortuous eastern course on the north side of Akar Kuf, and enters the Tigris at a point five miles below Baghdad, but, until altered by Daud Pasha to avoid the danger of inundations, it joined the Tigris a little above the city. The distance from river to river, by the course of the Euphrates steamer in passing, under Lieut. Lynch, in 1838, is about 45 miles.

Mesopotamia, in latter times, was composed of the territories of ancient Babel, the *Aram Nahrain*, or Syria between the two rivers, of Gen. xxiv 10, Dent. xxiii, 4, also called *Padan-Aram*. Gen. xxviii 2, meaning Champagne Syria. Ancient Babylonia is the modern Iraq-i-Ajam, the modern Irak-i-Arabi of the Persians and the *Al Jazira* or the "Island" of the Arabs. It was anciently called *Shinar*, from the Hebrew word for two and "ar" or *nahr*, a river. It is that part of the present pashalik of Baghdad, which lies between the widely sweeping currents of the Tigris and the Euphrates, includes the boundaries of Babylonia and Chaldea. Mesopotamia lies between the outer-limits of the Syro Arabian desert, and the foot of the great mountain range of Hindustan and Saristan. The Aramaeans, were a Semitic race of highlanders who first settled on the upper part of the Euphrates and Tigris districts, and then passed through Mesopotamia proper (*Aram* of the two rivers,) the low land (where is *Mash-Mons Masius*) which falls gradually towards Syria, afterwards called *Aram*. The name of *Uz*, in *Nejd*, proves that its offsets extended as far as North Arabia. The Chaldees was an Aramaic dialect, differing but slightly from the proper Syriac: Ezra iv., 8 to vi, 8 and vii, 12-26; Daniel ii, 4 to vii 28. and Jeremiah x 10. are written in the so called Chaldee. There is also a Chaldee gloss in Genesis xxvi, 47. The Babylonian language in the time of Nebuchadnezzar was very close to Hebrew. The Chaldee language may have been that of Terah, but the possibility of the language of Abraham remaining in its original state during the 216 years that he and his family resided in Canaan; and the 430 years that the Hebrews abode in Egypt; and the 400 years from the Exodus to David, is untenable. Rawlinson, Vol. i. p. 2.—Colonel Chesney's

MESUA, a genus of plants of the natural order Clusiaceae of which two species occur in the East Indies, and a few other trees of this genus remain to be determined. Pynaroo? TAM., according to Dr. Gibson, is the Malabar name of a species of Mesua, and it gives one of the finest woods he had seen. Mr. McIver sent to the Madras Exhibition of 1855, a wood called Irool maram, from a species of Mesua, common, in the Nelmahore jungles: much used by the natives for building purposes: durable and not liable to be attacked by insects. The Mesua, in Ceylon called "iron wood-tree," though not large, has an erect symmetrical figure, whose deep evergreen foliage flowing downward from its cone-shaped crest, quite conceals its bowing branches, so that when covered with its rich blossoms, with ivory white petals and deep yellow stamens, it looks like the royal umbrella bespangled with gold; and the Burmese say that their next Budha Aree-ma-taya, will enter the divine life while musing beneath its hallowed shades, hence it is a favorite tree with the buddhist priests of Burmah, who plant it around their monasteries. In Sanscrit it is called nagakeshura, and Sir William Jones remarks that "this tree is one of the most delightful on earth; and the delicious odour of its blossoms justly gives them a place in

MESUA FERREA.

the quiver of Camadeva, the Hindoo god of love." To this Moore alludes in the following stanza;

"Then rapidly, with foot as light
As the young musk roe's, out she flew
To call each shining leaf that grew
Beneath the moonlight's hallowing beams,
For this enchanted wreath of dreams;
Anemones, and seas of gold,
And now blown lilies of the river,
And those sweet flowerets that unfold
Their buds on Camadeva's quiver."

There are at least two different species in the Tenasserim Provinces, *M. pedunculata* and *M. ferrea* but much confusion exists in standard works on botany in relation to this last species. The *Mesua ferrea* of Roxburgh is the *M. Roxburghii* of Wight's illustrations the *Mesua* tree of Calcutta, Serampore, and neighbourhood. The *M. ferrea* of Wight's Prodromus is the *M. Coromandelina* of Wight's Icones, and Illustrations. The *M. ferrea*, of Wight's Illustrations, is the *M. nagaha* of Gardener, the *mesua* tree of Ceylon; while the *M. ferrea* originally described by Linnaeus is probably the species found on the Coromandel coast; but, for the lack of books which contain the description of Linnaeus, it cannot be affirmed with certainty.—*Reverend Dr. Mason. Dr. Gibson. Mr. McIver in M. E. J. R.*

This tree grows in Ceylon, in Peninsular and northern India, in Assam, Arakan, Burmah, Tenasserim, and Java. In Ceylon the vars. α and β, especially the latter. It is wild in Tenasserim and common about Galagama.

It is always planted near temples in Ceylon, as an ornament, because of its broad, violet perfumed flower, the outer leaves of which are white and thin, centres a deep maroon, it has a graceful shape, with dark polished green foliage, and brilliant red young leaves and shoots. Its white flowers have yellow filaments and are used by the

METALLIC MIRRORS.

native physicians, being supposed to possess medicinal properties. Indian poets say that it forms one of the darts of Kama Deva. The blossoms are remarkable for their fragrance, and are sold in the bazaars of India under the name of Nagkesur. Sir William Jones says that the delicious odour of its blossoms justly gives them a place in the quiver of Camadeva, the Hindu god of love. It flowers in the beginning of the warm season. The wood is very strong and tough. In a full grown tree on good soil, the average length of the trunk to the first branch is 20 feet, and average girth measured at 6 feet from the ground is 5 feet. A cubic foot weighs lbs. 69. The wood is said to be used for furniture. The dried anthers are fragrant; the flowers and leaves are used in Bengal as antidotes to snake poison. Its oil promises to be valuable if it can be obtained in sufficient quantities. The seeds are contained in a strong brown skin, one, two or three in each. When ripe the skin bursts and the seeds drop out. The seed is covered with a hard shell. The oil is an excellent remedy for cutaneous diseases, dried buds, considered a temperate remedy used in coughs especially while attended with much expectation.—*Rosburgh Fl. Ind. Irvine Gen. Med. MET SINDHI a clay quarried near Hyderabad and other places. The Persian name is Gil-i-sarshui—"the head-washing clay." When mixed up with rose leaves, instead of rancid oil, it makes anything but a bad wash-ball.—*Burton's Scinde Vol. I. p. 31.*

METAL DE CANONES, Sp. Bronze.

METAL DE FONTE OU DE CLOCHES, Fr. Bell metal.

METALLIC MIRRORS are still in use in Southern Asia. See Mirrors.

METAWALI.

METAL CASTING, in India, is very largely practised, and the processes are of great simplicity. The natives generally prepare a model in wax, which is embedded in moist clays, which, after being dried in the sun, is heated in the fire, the wax run out, and the metal run in. A much better plan, where accuracy is required, as in casting a brass nut or box for a large screw, is to cut the model in lead, and, having bedded it in clay, it may, when the mould is dry, be melted and run out, and the metal run in. Wax models allow the moulds to shrink in drying, and the thread of a screw box so formed, of course does not correspond. The best specimens of native casting Mr. Rhode had seen, were a set of figures cast at Pettapore, about A.D. 1820, for the zemindar, who had whole armies of such in bronze. In Mannbhoom, in Chota Nagpore, much ingenuity is displayed in the mode of casting articles of this kind in hollow net work, &c. A core is made of plastic clay, all carefully shaped to the internal form of the fish or other object to be imitated. This core is then baked and indurated. On this, the pattern designed to be represented is formed with clean bees' wax. This done, and the wax having cooled, it becomes tolerably hard. Soft clay is moulded over all. The whole is then baked, the heat indurating the outer coating of clay, but softening the wax, which all runs out of the mould, leaving empty the space occupied by it. The mould being sufficiently dried, the molten brass is then poured into the empty space, and, when cool, the clay is broken away, when the figured casting is seen. These are untouched after the casting, excepting on the smooth and flat surfaces which are roughly filed. The Chinese excel in all working in metals, in ordinary blacksmith work, metal smelting, alloys, particularly their white metal of copper, zinc, iron, silver and nickel, their sonorous gongs and bells, one at Peking being 14½ feet by 13 feet, and their ingenious metallic mirrors, some with engravings. The consumption of metals from abroad, by the Chinese depends very much on their price, for when high, their own mines furnish them cheaper. They have mines of lead, quicksilver, iron, and calamine, and probably of tin and copper.—*Mr. Rhode MSS. Calcut. Cat. Ec. 1862 Morrison.*

METALLUM TORMENTORUM, Lat. Bronze.

METAWALI a mahomed sect in Palestine supposed to be ancient Syrians, although, as a distinct sect, their name does not occur before the eighteenth century. They are distinguished from the other mahomedans

METHEL SEED, Eng. *Datura fastuosa* Mill. Roxb.

METEMPSYCHOSIS, or Transmigration of the soul is believed in by the lun-dos and budd'hists of Asia, and by all the pre-Aryan races in British India. The metempsychosis doctrine seems to have been held coeval amongst the brahmans and Egyptians. The Pythagorean sect of Magna Græcia seem to have derived it from Egypt. In the Institutes of Menu, at least thirty different creatures are named into whose bodies malefactors are imprisoned according to their crimes, the scale descending down to such particulars as that he who stole perfumes should be changed into a musk rat. Metempsychosis is the idea that a human being guilty of sensual sins, should be changed into animals that is only conscious of the senses. But metempsychosis, according to Bunsen is the recognition that there is a solution of the enigma of existence, which is not to be found in the term of a single life on earth, and yet which we are impelled to seek after, in order to explain this life. All guilt must be expiated; but the final issue, though reached only after the lapse of unnumbered ages, will be the triumph of the good, the general reconciliation, and a life in God will be the eternal heritage of the soul. Thousands of years before christianity announced the certainty of immortality, the three civilizations of the Egyptians, the brahmans and the Druids believed that the human soul died not after death. Abu Zaid the historian writing in A. D. 916, mentions that in Balhara and other parts of India, men burned themselves on a pile influenced by their belief in a metempsychosis, and he adds that when a man or woman become old, he or she begs that they may be thrown into the fire or into water. The Tibetan buddhists count six classes of existence, viz., four bad, those in hell, the brute, asur, and yidag, and two good those as man and God.—*Fraser's Journ. May 1868 Bunsen. Elliot's History*, pp. 1-9. *Haughton's Monu.* p. 406.

METEORIC FIRES The Shahaba, or wandering meteoric fires, on fields of battle and in the places of "great sacrifice," produce a pleasing yet melancholy effect; and are the source of superstitious dread and reverence to the hindu, having their origin in the

METEOROLOGY.

same natural cause as the "wandering fires of Odin;" the phosphorescent salt produced from animal decomposition.—*Tod's Rajasthan*, vol. I. p. 74.

METEOROLOGY, An interesting meteorologic point is the condition of atmospheric pressure during the monsoons. The course of the local monsoons is determined by the existence of alternately high and low atmospheric pressure over the country. This centre of minimum pressure, is, as it were, a point upon which the wind turns, or it is the goal towards which the wind blows, while the place of greatest pressure is the point from which the winds diverge. To find out these two points and to discover the relative position which each will take up at the change of the monsoon, in the months of March, April and October, is of primary importance. As the determination of these points gives the general character to the monsoon in each locality, so the irregularities, the exceptions to the rule, give a distinctive character to each season. For example, in 1863, a local depression in the north-west of the Bay of Bengal diverted the moisture-laden winds from Central and Northern India, and attracted an excessive rainfall towards Bengal west of the Delta and the northern part of Orissa. In 1869, the frontiers of Bengal were surrounded by a belt of low atmospheric pressure which shut in the rainfall, threatening to afflict the North-West with a second drought until an egress was found for the imprisoned clouds during September and October in a rise of pressure about Hazareebagh. These local atmospheric irregularities complicate meteorological observation and throw out calculation. Probably the most striking evidence of this that can be brought forward is their misleading effects upon the determination of heights by the barometer. Thus the difference of Outlack and Sangor islands, which is known to be only 74 feet, appeared from the barometric readings of 1868 to be 205 feet and from those of another year 166 feet. The track of cyclones, though of course not their occurrence, is influenced in a considerable degree by local depressions as was the case in the hurricanes of May, June, and October. Mr. Blanford calls attention to the unusually high temperature during the first five months of 1869. The area west of the Gangetic delta, over which the low barometric pressure then prevailed, enjoyed a temperature equal to that of Nagpore, "the thermal focus of India." The hot winds blowing from the North-West and Central India were, however, interrupted by the region of low pressure at

METEOROLOGY.

Hazareebaugh and Mongyr. At Darjeeling and Goalpara the temperatures were unusually low, and the cause suggested was the effect of the high temperatures over the country to the south of the Ganges. The local heating of the atmospheric pressure in the country south of the Ganges and west of the Delta, would arrest the north eastern progress of the hot winds and allow the free play of the cool breezes from Assam and the Snowy Range. Meteoric phenomena are not uncommon during Himalayan thunder-storms. From the hamlets of Hungipoor, for instance, in one of the valleys at the southern end of Cashmere, was witnessed a thunder storm, of awful grandeur. The lightning shot in tremendous zig-zags across the mountain tops. One bolt struck a pinnacle of rock, and remained a globe of fire for upwards of two minutes. The rainfall has been given for four years at thirty-two different stations; at Danga the highest fall in any one year was 125.1 inches, and the average for the four years was 91; at Simla it was 68.2 and 57.9 inches. There are only three other stations at which the rainfall in any one year exceeded 40 inches, and at only two of these the average was over 40, while other stations seem to have almost as little rain as Aden. For instance at Multan in 1870, there was a fall of only 2 inches, and in the same year Jhung had only 3.4 and Dera Ghazee Khan 2.4; in 1868 Moozuffurgurh had only 2.8 inches, and in many places a fall of very much under 10 inches seems to be common. The average downfall for 1867 and 1870 (the first and last year given), notwithstanding the very heavy falls in some places, is only a little more than 20. Dr. Neil lays down that "as a general rule, to which, however, there are frequent local exceptions, a rainy cold season is the precursor of a partial failure of rain in the proper rainy season." Experience would lead most people to the same conclusion. He also tells us that "the more rain the Southern Districts receive, the less falls to the share of those more to the north," which rule "would seem to hold good for the monthly amounts during the rainy season, more than for the annual falls;" in other words it is not raining at all places at the same time, and the rain takes a certain belt of latitude at once, taking those to the north, or south of it also in belts at other times. We have heard the theory of belts of rain broached before, but we do not know that any well-organised observations on a large scale have ever been made, as they easily might be, to test its accuracy. In the

METROSIDEROS.

Panjab, June and July seem to be the hottest months. The highest monthly mean temperature in Lahore, Rawul Pindee, Dera Ismael Khan and Syalkote during the four years 1867-1870, was, at the last station, in June 1867, when it was 96°·9, but Lahore in July 1870 comes pretty near it, and is 96°·1. The mean temperature is tolerably low, but there appears to be very great heat, and considerable fluctuation of temperature. At Lahore in May 1870 the maximum and minimum were 121°·5 and 61°·0 respectively; and from April to October the maximum ranges each month from 105° to 121°·5 and, the minimum from 50° to 72° giving a variation of from 60° to 60°

METROSIDEROS (from *μετρον*, the heart of a tree, and *σιδηρος*, iron), a genus of plants belonging to the natural order Myrtaceæ so named because of the hardness of their inner woods. *M. lucida*, a beautiful tree, occurs as far south as Lord Auckland's Islands, in lat. 50½ south. *M. polymorpha*, is a tree of the Sandwich Islands, and is said to be the plant from which are made the clubs and other weapons employed in warfare by the South Sea Islanders and *M. verus*, of China? Java and Amboyna, is said to furnish the iron wood of China. It grows among rocks. The Chinese and Japanese value its wood for making rudders, anchors, &c., for their ships and boats. The bark is used in Japan as a remedy in mucous discharges, diarrhoea, and dysentery. It is usually mixed with some aromatic, as betel nut, cloves, or nutmeg.—*Rozb. ii. p. 447. Eng. MEWA FAROSH, PERS. A fruit seller, usually of the mali caste, but in the Malratha country brahmins and kalawant or singers follow the business in towns; the fruit sellers in the villages are sometimes mahomedan gardeners.

MEWAR. The rana of Mewar, the capitals of which are Chitor and Udayapur, is of the race who ruled in Saurashtra. After the destruction of the Balhara monarchy of Saurashtra, and two centuries sojourn of the family in the Bhauder desert, Baph or Bappa conquered Chitor, and founded a new dynasty, in AD. 727. The hereditary title was changed from Gehlote to Aditya. In 1528, Jewan (Javan) Sinh, the only survivor of the race of Bappa, was on the throne. Mewar, is a rajpoot kingdom, of the Suryavansa race, the chieftan of which is styled rana and he dwells in the capital Chitor. The rana is admitted to be the descendent of Rama, who reigned about seven hundred years before the christian era. Rama was the chief of the Solar dynasty and Mewar is the most ancient but not the most powerful house of Rajputanah, there being no doubt that they have reigned there upwards of 2000 years. The Mewar state was much exposed, and was overrun successively by Mahomed of Ghazni, and the emperor Akbar who in 1568, destroyed its capital of Chitor. The rana took refuge in the Aravalli mountains, and founded Odeypore the present capital. Baba is a term applied to the descendants of Oody Sing, the rana of Mewar. He lived for four years after the loss

MEWAR.

of Chitor, and expired at Gegoonda, aged forty-two. He left a numerous issue of twenty-five legitimate sons, whose descendants, all styled Ranawut, pushed aside the more ancient stock, and form that extensive clan distinctively termed the Baba, or 'infants' of Mewar, whether Ranawut, Poorawut, or Kanawut. His last act was to entail with a barren sceptre contention upon his children, by setting aside the laws of primogeniture and proclaiming his favourite son, Jugmal, his successor. The rana of Mewar, is the dewan, or vicegerent of Siva, and when he visits the temple of Eklinga, he supersedes the high priest in his duties, and performs the ceremonies.

The shrine of Eklinga is endowed with twenty-four large villages from the fisc, besides parcels of land from the chieftains. The hills of Mewar and the neighbourhood are, however, still held by aboriginal tribes. The Mewar ruler is styled rana, and is the elder branch of the Sooryavansi, or children of the sun. Another patronymic is Raghoovansi, derived from a predecessor of Rama, but Rama is the focal point of each scion of the solar race. To him, the conqueror of Lanka, the genealogists endeavour to trace the solar lines. The titles of many of Rajput claimants are disputed; but the hindu tribes yield unanimous suffrage to the prince of Mewar as the legitimate heir to the throne of Rama, and style him Hindua Sooraj, or 'sun of the Hindus.' He is universally allowed to be the first of the 'thirty-six royal tribes;' nor has a doubt ever been raised respecting his purity of descent. Many of the royal tribes have been swept away by time, but the genealogist, has filled up their place with others, mere scions of some ancient but forgotten stem. With the exception of Jessulmer, Mewar is the only dynasty of these races which has outlived eight centuries of foreign domination, in the same lands where conquest placed them. The rana still possesses nearly the same extent of territory which his ancestors held when the conqueror of Ghazni first crossed the 'blue waters' of the Indus to invade India; while the other families now ruling in the north-west of Rajasthan are the relics of ancient dynasties driven from the pristine seats of power, or their junior branches, who have erected their own fortunes. This circumstance adds to the dignity of the rana of Mewar and is the cause of the general homage which the ranas receive, notwithstanding diminution of their power. Sesodia is the last change of name which the ranas of Mewar race have undergone. It was first

MEWAR.

Sooryavansa, then Grahilote or Gehlote, then Aharya, and now Sesodia. These changes arise from revolutions and local circumstance. The tin-mines of Mewar were once very productive, and yielded no inconsiderable portion of silver: but the caste of miners is extinct, and political reasons, during the Mogul domination led to the concealment of such sources of wealth. Copper of a very fine description is likewise abundant and supplies the currency: Sarma, or the oxide of antimony, is found on the western frontier. The garnet, amethystine quartz, rock crystal, the chrysolite, and inferior kinds of the emerald family are all to be found within Mewar. The rich tin-mines of Jawara produced at one time a considerable proportion of silver. Those of copper are abundant, as is also iron on the now alienated domain on the Chumbul; but lead least of all. The marble quarries also added to the revenue; and where there is such a multiplicity of sources, none are considered too minute to be applied in the necessitous times. The rich mineral products enabled the Mewar family long to struggle against superior power and to raise those magnificent structures which ornament their kingdom. In Mewar, "An" was the oath of allegiance in Col. Tod's time. Three things in Mewar were royalties;—a subject cannot meddle with the An, or oath of allegiance; the Dan or transit dues on commerce; and the Kan, or mines of the precious metals. There are two classes of Rajput landholders in Mewar, though the one greatly exceeds the other in number. One is the Grasya thakur, or lord; the other the Bhoomia. The Grasya chieftain is he who holds (gras) by grant (putta) of the prince for which he performs service with specified quotas at home and abroad, renewable at every lapse, when all the ceremonies of resumption, the fine of relief, and the investiture take place. The Bhoomia does not renew his grant, but holds a prescriptive possession. He succeeds without any fine, but pays a small annual quit-rent, and can be called upon for local service in the districts which he inhabits for a certain period of time. He is the counterpart of the allodial proprietor of the European system, and the real 'zemindar' of these principalities. Both have the same signification; from bloom and zamin, 'land' the latter word being of Persian origin. Grasya is from gras, 'a subsistence'; literally and familiarly, 'a mouthful.' It may have a like origin with the Celtic word gwas, said to mean 'a servant,' and

MEWAR.

from which the word vassal is derived. All the chartularies or puttas commence To . . . gras has been ordained. Bhomia, from bhom land, means a landed proprietor, in Rajputanah, the allodial proprietor of Mewar, offshoots of the earliest princes. The term "bapota" implies the inheritance or patrimony and its holder, if a military vassal, is called 'Bhomia,' meaning one actually identified with the soil (bhom). It is the mahomedan term wattar-dar, or meeras-dar and the Kaniatchi of Malabar is the bhomia of Rajasthan. The bhomia is vested with the rights of the crown, in its share of the bhog or rent. But when their own land is in the predicament called 'gult'has,' or reversions from lapses to the commune, he is 'seized' in all the rights of the former proprietor, or by internal arrangements, they can convey such right by cession of the commune. The bhom is exempt from the jureeb or measuring rod; it is never assessed, and his only sign of allegiance is a quit-rent, in most cases triennial and the tax of khur-lakar, a warimposition, since commuted for money. These allodial tenants, are the yoomen of Rajasthan, and as in the districts of Konkaner and Mandelguri, constitute the landwehr, or local militia. The Rajpoot vaunts his aristocratic distinction derived from the land; and opposes the title of 'Bhomia Raj,' or government, of the soil, to the 'Banir Raj,' or commercial government, which he affixes as an epithet of contempt to Jeypoor; where 'wealth accumulates and men decay.' 'Bhom rakhwal' or land [in return for] preservation, is one kind of Bhom, the crown itself hold 'bhom rakhwal' on its own fiscal domesnes consisting of small portions in each village. In S. 1782, the turbulent bhomia on the western frontiers were checked by the Rajput chief on their borders, and the Sindil, the Deora, the Bila, the Bora, the Balochan, and the Soda were then compelled to servitude. The ancient clans, prior to rana Sangha had ceased, on the rising greatness of the subsequent new division of clans, to hold the higher grades of rank; and had, in fact, merged into the general military landed proprietors of the country under the term 'bloomin.' The Bhoomi, the seniors of the earliest princes, are to be met with in various part of Mewar; though only in those of high antiquity, where they were defended from oppression by the rocks and wilds in which they obtained a footing, as in Komulmer, the wilds of Chuppun, or plains of Mandelguri, long under the kings, and where their agricultural pursuits maintained them. Their clannish appellations, Kombawut,

MEWAT.

Loonawut, and Ranawut, distinctly show from what stem and when they branched off; and as they ceased to be of sufficient importance to visit the court on the new and continually extending ramifications, they took to the plough. But while they disdained not to derive a subsistence from labouring as husbandmen, they never abandoned their arms; and the bloomia, amid the crags of the alpine Aravalli, where he pastures his cattle or cultivates his fields, preserves the erect mien and proud spirit of his ancestors, with more tractability, and less arrogance and folly, than his more courtly but now widely separated brethren. They form a considerable body in many districts, armed with matchlock, sword and shield. In Mandelguri, when their own interests and the prince's unite, four thousand Bloomia could be collected. They held and maintained without support the important fortress of that district, for their prince, during half a century of turmoil. Aravalli, according to Colonel Tod means the refuge of strength, its hills have afforded protection to the most ancient sovereign race in the east or west—the ancient stock of the Suryavansa, the Heliadae of India, or children of the sun, the princes of Mewar, who, when pressed were wont to retire to its fastnesses, only to issue again when occasion offered. The Aravalli hills are connected by lower ranges with the western extremity of the Vindhya mountains on the borders of Guzerat, and stretch northwards to a considerable distance beyond Ajmir, in the direction of Delhi, forming the division between the desert on the west and the central table-land. It would be more correct to say the level of the desert, for the south eastern portion including Jodpur, is a fertile country.—*Prinsep's Antiquities by Thomas*, p. 248-258. *Tod's Rajasthan* Vol. i. pp. 10, 12, 13, 136, 154, 163, 164, 169, 172, 198, 211, 212, 516, 517. MEWAS a Koli tribe of freebooters in Guzerat.

MEWAT. A district S. W. of Delhi, notorious for the lawless habits of its inhabitants, a very ancient hindu race, but the greater part forced proselytes to the mahomedan faith. In the time of Pirthiraj the chief of Mewat was one of his vassals. The

MEYT AIS.

whole of its towns were levelled to the ground by Jessraj. The Mewati is a tribe of Rajputs inhabiting the province of Mewat, now known as Macheri, and formerly notorious for their turbulent and predatory character. They are a thieving tribe of cultivators found here and there along the S. West borders of the N. W. Provinces of India. The Alwar country near Delhi seems of late to have been called Mewat, but they extend further east than the Gujar and in Malwa are common as irregular soldiers and depredators. They are supposed to be mostly mahomedans. The turbulent Mewati of Alighur form a large element in the population. A punishment was inflicted on the Mewati tribe, which inhabit the hilly tract, within 25 miles of Delhi. In 1265, 100,000 were put to the sword, and a line of forts was constructed along the foot of their hills. The Mewati mahomedans partake of both religions. Though stigmatized as robbers and assassins, they are at the same time admitted to be faithful and courageous guards and servants to those in whose service they engage: in Hindustan, they were entertained as sebondies, or militia, by the renters and managers of the country, and were deemed faithful to those they served; but great numbers of them who settled in the villages became professed depredators: they were, however, generally, in bodies which Rajpoot lords and wealthy landholders could alone afford to maintain.—*Malcolm's Central India*, Vol. 11, p. 174. *Rennet's Memoir*, p. xlix. *T. of H.* Vol. ii. p. 126. *Campbell*, p. 103. *Tod's Rajasthan* Vol. I p. 169, 498.

MEZZALE, BURM. A tree of Amherst, Tavoy and Mergui, of maximum girth 4 cubits and maximum length 30 feet. Found scattered, not very abundant, all over the provinces. When seasoned it floats in water. It is used by the Burmese for rulers, mallets and walking sticks; is of very handsome streaked grain like palmyra wood, but not sufficiently durable to be recommended for ordnance purposes.—*Captain Dance*.

MGANGA, See Somal, Beer-us-somal.

MHA-GHAI, BURM. *Elaeocarpus* species.

MHAIR. The Mhairwara country is situated but a very few miles west of Ajmer and is composed of successive ranges of huge rocky hills, the only level country being the valleys running between them. Either from the insignificance or sturdily valour of this race, the rulers of India were never able to make any impression on them, notwithstanding their vicinity to the occasional residence, for a long period, of the emperors of Hindustan. In later times the Mhair have been the terror of their lowland neighbours; and even the Rajpoots, perhaps, with the sole exception of the Rohilla, the bravest men in India, dreaded their approach. The Mhair of the Mhairwara hills occupy the Aravali range running towards Ajmir. Their chiefs claim to be of Rajput descent, but the Koli assert their relationship to them, and they admit having intermarried with the Bhil and Meena, and Colonel Dixon says that for hundreds of years, they have been recruited by refugees and all sorts of rascals from Hindustan, and are now probably a very mixed race. They are described as rather good looking. Colonel Briggs states the Mahratta and Mhair names have a similar origin. The Mhair claim never to have been conquered, nor to have paid tribute to the thakurs of Kharwa or Mussooda or to the bhoomshahs of Mewar. Some of them remonstrated against being handed over to Joudpur and the people of a few villages which had been transferred migrated to British territories. The Mhair race, amongst whom the latter part of Colonel Dixon's career was passed is one of the bravest and amongst the most predatory of the Non-Arian races in India, and Colonel Dixon's efforts were directed to civilizing them. Gradually they

MHAR.

became attached to industrial pursuits. Col. Dixon built a new town, strong and well planned, with two miles of wall as a defence and encouraged strangers of various castes, particularly that of shopkeepers and bunneahs to settle in its capital, a readier means of buying and selling being two of the great wants of the young community. Up to A. D. 1838, the district was wholly dependent on supplies brought in (chiefly by plunder) from a distance. But by 1850 the population had much increased, and exported to surrounding towns and villages considerable supplies of produce; and the sounds of honorable industry were heard not only in the vicinity of Nya Nuggur, but in three or four hundred villages erected in the midst of the jungle. Civilization dawned on the face of those long-troubled hills in some of its most benignant forms.—*Cole. Myth. Hind. p. 299; Campbell p. 45. See Mair; Med; Meena.*

MHAN BIN, BURM. Morinda.

MHANG, a helot race mostly predial slaves amongst the Mahratta villages, employed as the scavenger, guide, watchman, and executioner. They take the place of the chakili or chuckler amongst the Tamil race.

MHAR, The Mhar of the Mahratti-speaking countries, is undoubtedly the Dher of the Dekhan, the Holiar of the Canarese, and the Pariah of the Tamil people. Throughout the Hyderabad dominions, most of them have claims for allotments on the cultivators, though the Mhar does not, or only rarely cultivates, on his own account. There are 230,772 Mhar or Dher in the Berars, or about a ninth part of the Berar population. Professor Wilson, writes the word Mahar, Mhar, Mher, Mhao, Maw and Mar. They are regarded by hindus as lower than the Dher, but the Mhar, Dher, Eskar, Holiar, and Pariah are undoubtedly one people. They are to be met with throughout the Mahratta country, dwelling apart outside the village, and are often part of the Baloth. The mark for their signaturo is a staff. They are a willing, ready people, obliging, grateful for any little kindness; and, for the traveller, whether at midnight or midday, in sun or rain, or cold or heat, they take up their staff and move cheerfully along to show the road to the next village. Indeed, in the great tract of the Central Dekhan, the Dher, or Mhar and the Mhang, are the only free labourers, for the hindu farmers rigidly prevent them holding land, and with equal tenacity prevent those of the hamlet leaving it lest the farming villages lose their labouring hands. They

M'HLECHA.

are really village slaves throughout the Hyderabad territories, but claim certain ancestral rights. The Dher or Mhar, and the Mhang of the road-side hamlets earn a little as begar coolies or labourers whose service travellers can claim to carry loads, but the usual payment, and what they themselves demand, is only an anna for four cos (or 8 miles), and, with the recent increased prices of all supplies, their means must be insufficient. They all said so, and their clothing indicated insufficient purchasing means. Their personal appearance did not evince any insufficiency in food. But, an increase in the begar payments seems advisable, particularly for such as dwell on lines of much traffic; and in any arrangements for village conservancy or protection from small-pox, these non-hindu communities should be carefully included. The Mhang and Mhar dwell on the outside of every village and hamlet of the peninsula of India, as the predial or village slaves. They are called by Mr. Campbell, a helot race, and are generally regarded as part of the Non-Aryan peoples of India, of which there are upwards of twelve millions in British India. The Mhar or Dher or Pariah is free spoken, intelligent, well informed, considering his position, and has large and liberal views as to religion and policy. The brahminical religion, however, whether of the Saiva the Vaishnava, or Vira-Saiva types has never recommended itself to them, nor have they taken to mahomedanism, or to christianity. They are decided shamanists, nature-worshippers and spirit worshippers, and though living in hourly communication with the Hindu, Brahmin, Kshatrya, Vesya and Sudra, they have not adopted any hindu tenets but seem to have imparted to the hindus several shamanist customs. From the great numbers of the Chamar or leather worker race of northern and Central India who have joined the Sadh-Nami sectarians, theistic teachings would seem to be the more acceptable to the Non-Aryan populations of the central parts of India. See India.

M'HLECHA. The Arians seem to have brought with them a servile race, or to have had amongst them a social distinction between the noble and the common people which has ever continued up to the present day. As they conquered southwards, amongst the Tartar races whom they found in the country, they reduced them also, every-

MIAKO.

where to a state of slavery. They named them in fierce contempt Dasa or slaves and these formed the true servile race of Menu and other writers. Where the races who had preceded them retained their independence these proud immigrants styled them M'hlecha, a term which even to the present day, is intended to comprise every thing that is hateful or vile. To all these prior races, the Aryan immigrants applied the most contemptuous expressions, Dasa, slave; Dasya, country people, Locust-eaters, Hole-dwellers, Rejectors of Indra, Monkey-tribes, Snakes, but the term most frequently used is M'hlecha. This name, now used to designate any person other than a hindu, long continued to be applied, to all the unsubdued Non-Aryan tribes in India. But many of the aboriginal Scythian inhabitants of India seem to have been subdued and transformed from Mleehcha into Sudra, by slow degrees and the process is everywhere yet in progress. In the age of Menu they retained their independence and the appellation of M'hleehcha, in Bengal, Orissa, and the Dekhan; but in the earlier period which is referred to in the historic legends of the Mahabharata, the M'hleehcha and Dasya are mentioned as disputing the possession of Upper India itself, with the Arya race and in conjunction with certain tribes connected with the Lunar line, they succeeded in overrunning the territories of Sagara the thirty-fifth king of the Solar dynasty.

M'HOR-ANGAI, also M'hor-Angi HIND. *Nisactus bouelli*, *Temm.*

MHOW. A British cantonment in Holkar's dominions.

M'HOWA, *Bassia latifolia* tree, from the blossoms of which the common native liquor is distilled.

MHYE, in Guzerat, a broad fine stream. It attains in Malwa no great size or body of water, it has its rise in a small plain five miles west of Amjherra, and shortly after passing Bhopawur, pursues a northerly course till it reaches the upper confines of Bagur, where the boundary hills give it a sudden turn westward past Mongana: it is, however, soon diverted from this direction by the high primary mountains of Mewar, which bend it south, and this course it pursues, with little deviation, till it falls into the sea in the Gulf of Cambay, near the town of that name. This river is not deemed navigable above twelve or fifteen miles from its mouth, owing to its numerous shallows.

MHZUNGU, See Somal.

MIAKO, a town in Japan, Fudsiyama is a high volcanic mountain of Japan, at pre-

MIANA.

sent inactive, but which tradition reports to have risen in one night, and, as it rose, there occurred a depression in the earth near Miako, which now forms the lake of Mit-suno-umi. In A.D. 864, the mountain burst asunder from its base upwards, and at its last eruption in 1707, it covered Yedo with ashes. It is a sacred mountain. It is crested with snow, and presents the appearance of a truncated cone, and the gathering of a white cloud around its summit, is a sign of bad weather. It is occasionally ascended by Japanese pilgrims for the worship of the god of the winds. The religious and supreme emperor who lived at Miako had twelve wives and twenty-five other consorts. Neither the hair of his head, his beard or his nails were ever cut. All his victuals were prepared in new vessels, which were broken after using them, and his garments renewed daily were also daily destroyed, to prevent any others using them. When he went abroad, he was carried in a palanquin, from whence he could see without being seen. This supreme emperor alone lived in polygamy, all the people having but one wife.—*Japan*, pp. 409-411. See *Japan*, Kio-kobo.

MIANA, a predatory race in Cutch. The Miana of Mullia in Mucha-Kanta on the banks of Muchu river, are the real masters of Mullia. They have a thakur, but own allegiance only to their own chowhatia or heads of tribes. They are turbulent, take service as soldiers in the neighbourhood, and in every boundary fight, a Miana or two is killed.

MIANA or Mai, or Miani or Moana, a tribe at Khyrpor in Sind, subsist by fishing, their women are on a very large scale, thick-set and dark; few of them handsome, they wear ear and neck ornaments of unseemly size. In marriages and other festivals men and women join in the dance. The women form a circle round the musicians, move in slow time beating the ground with their feet, and clapping their hands which they raise above their heads. The Miana tribe of fishermen and boat-men, find occupation and subsistence on the river Indus. The Miana, though it is usual to style as Sindhians all classes generally who inhabit the country, as hitherto observed by all travellers passing through it, form a third of the mahommedan population of Sindh, and form a large tribe, apart from either the Jutt cultivator or the turbulent Biluchi. The Miana or Miani are the most active and athletic race in Sindh, with a buoyancy of spirits and generally frank bearing unknown to the other classes. Many of them as fishermen live, it may be said, in, rather than

MIANNA.

on the river, but all have villages immediately on its banks, their boats and nets furnishing all that is required for their maintenance. In many parts of the stream, especially near the great lake Munchur, whole families of this class live entirely after the Chinese fashion in their boats, having no other habitation. The women share the labour equally with the men, and a sturdy lass is generally seen steering or paddling the boat whilst the man works at the nets, a child being often suspended in a net-work cot between the mast and rigging of the craft, which is always very small and light for the advantage of easier navigation amongst the shoals and creeks. The navigation of the Indus is carried on by the Miana, and passing his life on the river he is the only pilot to be trusted in its intricate channels. The Pullah fishery, for which the Indus is so celebrated, is conducted by this people. First placing on the water a large earthen vessel and commending it to the care of Allah, the fisherman easts himself on it in such a manner that the mouth of the vessel is completely closed by the pressure of his stomach; he then paddles himself by means of the action of his hands and feet into the centre of the stream, holding deep in the water a forked pole about fifteen feet in length, to which is attached a large net; in his girdle he carries a small spear, and a check-string attached to the net indicates the moment when a fish is entangled. The spear is used to kill the fish when drawn up after capture, and the jar receives the spoil. The Miana, are poor though exceedingly numerous. They are dissipated, and a large proportion of the courtesans and dancing women of the country are from this tribe; they are of very dark complexion, but possess regular features, and some of the women would be considered remarkably handsome. The Miana are also noted for the manufacture of mats and baskets, which are beautifully woven from the high reeds and strong grasses growing on the edge of the river. The Miana, when found near towns and villages, occupy a distinct quarter, generally outside or apart from the other inhabitants. Here they sell spirits, the men beat drums and sing and the women dance and perform all the usual acts of courtesanship calculated to allure the passing stranger.—*Postan's Personal Observation*, pp. 58, 59, 60. See *India*; *Kattyawar*.

MIANEE, a battle was fought at this place by Sir Charles Napier against the amirs of Sind, and won on the 17th February 1843.

MIANNA a town situated in a wide valley, closed to the south-east by the lofty moun-

MIAUP-BOUT.

tains of the Koffan-Kou. It is a poor place, being best known by the ill-name of its bngs—*Porter's Travels*, Vol. I. p. 265.

MIAOU-TSE, also written *Miau-tze*, and said to mean children of the soil and similarly in Chinese we have *Yan-jin*, dog-men; *Man-jin*, savage-men; *Hungmian*, red family; *Peh-ko-lo*, white kolo. The *Maou-tse* are an aboriginal race or races in the hilly parts of China, and are divided into the *Black* and *White Minon-tse*. They have various tribes with separate names. The white *Minon-tse*, who occupy the hill country of central China, present many points of resemblance to the *Karen*. They are brave, independent, and at certain intervals sacrifice an ox without blemish to the Great Father. It is amongst the *Miaou-tse* that the old Testament is said to have existed from time immemorial, which they say came to them from heaven 2000 years ago. See *India*.

MIAS JAV. or *Orang-utan* **MALAY** occurs in Borneo, are species of *Pithecus*. One kind called "*Mias-chappan* or *Mias pappan* has the skin of the face broadened out to a ridge or fold at each side. One killed by Mr. Wallace was 7 ft. 3 in. across the arms and 4 ft. 2 in. from head to heel. The small *Mias* is called by the *Dyak* race *Mias kassir*. The *orang-utan* in Borneo, lives in the low swamp in forests. Their food consists of fruit, with leaves, buds and young shoots. They rarely descend to the ground. The *Dyaks* say that only the crocodile and python will attack the *orang-utan*. When fruit is scarce it goes for food to the banks of rivers and the sea, and the crocodile tries to seize it, but it gets on the crocodile, beats him with its hands and feet, tears him and kills it by main strength, tearing open its jaws and throat. The Python, it seizes and bites and kills. The *orang-utan* is confined to Borneo and Java. A full grown *mias* is quite a match for a naked man, and generally before he can be killed contrives to bite off two or three fingers or otherwise maim the individual. Many *Dyaks* are to be seen thus mutilated by them.—*Wallace* I. pp. 54 and 60.

MIA-SAHIAH. ARAB. Liquidamber.

MIAS CHAPIN. MALAY. A species of *Orang-utan*, *Pithecus curtus*.

MIAS PAPPAN. MALAY. A species of *Orang-utan* of Borneo.

MIAS RAMBI. MALAY. A species of *Orang-utan*. The *Pithecus brookei* of Borneo.

MIAUP-BOUT. Used for furniture, &c.

MICA.

MICA.

Kin-sing-shih,	CHIN.	Tulk,	PERS. DUK.
Yin-sung-shih,		Abmaka,	SANS.
Aorak,	HIND.	Abmukam,	TAM.

Several varieties of this mineral are found in India, especially in Behar, and in the Northern Circars. It readily splits into transparent, elastic flakes. It consists of nearly equal parts of silica and magnesia, and about 6 per 100 of lime. Slips of mica afford a convenient substitute for platinum foil, in chemical experiments on the effect of heat on organic bodies and they are useful for covering photographs. Mica occurs usually in thin tabular plates or scales, resembling glass; it is rarely crystallized in four or six-sided short prisms or long six-sided pyramids. It melts before the blowpipe into a greyish spongy glass; it is soft, pliant and easily scratched, its colors are white, yellow, brown and black. Sp. gra. 2.656. In China, mica is used medicinally. The principal Mica mines of Behar, are situated on the northern face of the Vindhya hills, where the three districts of Behar, Monghyr and Rainghur meet. The most westerly mine is situated thirty-seven miles in a south easterly direction from Gaya, and is in the district of Behar: the most easterly mine is about sixty miles distant in zillah Monghyr, the whole of the intermediate sixty miles being more or less productive of the mineral. The average distance from the Ganges of the whole aggregated group of mines is sixty miles. Those mines only which lie within the boundary of the district of Behar are worked, those within the district of Monghyr, from some unknown reason, are neither worked nor regarded as of any value by the owners of the estates in which they lie. The mica reaches the surface in three different states, viz. the good, hard and serviceable mineral; the soft, wet and flimsy mineral: and the chipped and powdered mineral. The tests as to whether the mica is good for any thing, or whether, as the natives say "it is alive" are its firmness, specific gravity, and the power of reflecting the countenance free of contortions; the latter test showing the perfect parallelism of its individual plates and consequent likelihood to split well; the heavier the mineral and the more perfect the reflection, the more valuable is the mineral considered; all the plates not standing the necessary test, are of a soft and flimsy nature without any of the brilliant sparkle of the better sort, the natives call this the "dead mica," and it appears to be in a state of decay. The plates of the superior kind are

MICHELIA CHAMPACA.

used in all the large Gangetic cities and towns, by the native draftsmen, whose beautiful productions in body colors, must be familiar to most people: by the lamp and toy makers; by the mahammedans for ornamenting their taziah or tsboot, as well as for ornamenting umbrellas, and boats, and for making artificial flowers. The second and third kinds are pounded and used for ornamenting toys, pottery, the inside of houses, for sprinkling over clothes and turbans at feasts, the sparkle from which by torch light resembles diamonds; but the great consumption of the inferior mineral takes place during the Hooli festival, during which period the "abir" or pounded mica mixed with the flour of the small grain, Kodu, *Paspalum stoloniferum*, *Linu.*, and colored with some red coloring matter is freely sprinkled over the votaries of those bacchanalian orgies. It is the soft shining scaly part of granite and is very liable to decay from constant damp; it passes into a greasy or soapy earth or loam. Mica is mixed with lime to form a beautiful glistening plaster, for native buildings. Mica is exported from Bombay in considerable quantities. In the year 1861, five tons of the value of £. 146 were exported.—*Capt. Sherwell, Revenue Survey, Beng. As. Soc. Journ.* No. IV, of 1851. *Cat. E. 62. O'Shaughnessy*, p. 694.

MICCA MICCANUTTAN. SecCapillaire.

MICHA, BALL. Black pepper.

MICHAEL or Mikail, according to mahomedan belief, the angel who has charge of heavenly bodies, of breathing creatures, and of the angels tenanted in the seventh paradise.

Fruit.

Chamakri. HIND. | Chamote. HIND.

A large tree of the Moluccas, of Java, of most parts of India, Ceylon and China. It grows in the Punjab at Kalka, and Kangra, and at Chumba at 2,000 to 3,000 feet and in Kangra, it was one of the padshahi royal or reserved trees. Those at Chumba are 7 or 8 feet in girth and 60 or 70 feet high. Ploughshares are occasionally made of the wood. In Ceylon it is used for drums carriages, palanquins and in buildings; it is prized for well works, verandah posts and for furniture, as it polishes well, though it is apt to warp. It is not subject to worms. It flowers and fruits nearly all the year and has large deep yellow intensely fragrant flowers. Doubts exist as to whether the Kalka, Kangra and Chamba tree is of the same species, as *M. champaka*, but the wood is used for the same purposes. In China its bark is used with that of other maguoliaceæ to adulterate cinnamon.

This beautiful golden coloured flower is held in high estimation by the hindoos, by whom it is dedicated to Krishna and is one of five with which the hindu "Kama," the god of love, ornaments his arrow. When Vasant'ha the personified spring time, is preparing the bow and shafts, for his friend, He bends the luscious cane, and twists the sting
With bees how sweet! but oh! Low keen their sting!
He with fine flowerets tips the ruthless darts,
Which through five senses strikes enraptured hearts;
Strong Champa, rich in odorous gold
Warm Amer, nursed in heavenly mould;
Dry Nag-Kesar, in silver smiling;
Hot Kittikum, our sense beguiling;
And last, to kindle fierce the scorching flame,
Love-shaft, which gods bright Bela name.

Sir William Jones says its aromatic scent is so strong as to be offensive to bees, who never alight upon it. Rheede informs us that the powder of the bark of the root of this tree is given to excite the flow of the menses. It is from this tree that the aromatic Sumpunghee oil of Madras is obtained. It is one of the few trees embalmed in English song,

"The maid of India blest again to hold,
In her full lap, the Champac's leaves of gold,
Thinks of the time when by the Ganges' flood,
Her little playmates scattered many a bud
Upon her long dark hair."

Its rich orange exquisitely fragrant, blossoms, are used by Burmese maidens to adorn their "long black hair." The bark is

MICHELIA NILAGIRICA.

bitter, and aromatic, and on several trials appeared to Dr. O'Shaughnessy to possess the properties attributed to the *Magnolia glauca*. It may be given in powder in intermittent fevers in doses of from 10 to 30 grains. Its aromatic properties are dissipated by boiling either in water or spirit, and on evaporation, a bitter extract remains, which contains tannic and gallic acid.—*Roxb. Voigt, Mr. Mendis Captain Macdonald, Captain Puckle. Dr. J. L. Stewart. Ains. Mat. Med. p. 157. Drs. McClelland. Mason. O'Shaughnessy, p. 193. Smith, Chin. Mat. Med.*

Vur. b. Walkeri, *H. f. et T. (M. walkeri and M. glauca, Wright)*; petalis cum sepalis sapissimae 12.

This large tree grows in the Central province of Ceylon up to elevations of 3,000 to 8,000 feet. It is rare in the Walliar forests, being alpine in its tendencies, and is common on the Neilgherries, Dr. Gibson had not seen it wild in the Bombay forests, though, in gardens and about dwellings, it is common. Its wood is strong, close, fine grained and straight; a pretty olive colored mottled wood, close grained, without being heavy, but too highly hygrometrical to be useful in other form than rafters or beams, it could be turned to account in house-building, and might with advantage be creosoted. It has yellowish white fragrant flowers. In Ceylon the most typical form of this plant is that called *M. Walkeri* by Dr. Wight. Its beautiful golden coloured flowers, are held in high estimation by the hindoos, the bark of the

MICIPPE CRISTATA.

root of the tree is used medicinally in some female complaints. At the Madras Exhibition of 1855, a plank from this tree contributed by Capt. Cunningham of the Mysore Commission had the extraordinary dimensions' (length 11½ feet, breadth 4½ feet, thickness 3 inches). The ornamental character of the wood, was well shown in that specimen, and was apparently from a tree of very great age.—*Thwaites, Enumeratio Plantarum Zeylanica, Part. I. p. 5, Drs. MICHELIA SUAVEOLENS, the Champaca of Java, its small flowers are in much esteem by the Chinese women. *Bennet.*

MICHNEE MOMUND, Punjpao Momund and Pindoe Alee Momund. The Michnee Momund, after annexation, by the British were allowed to hold a fief or jagheer in Doaba, the fertile triangle near the junction of the Swat and Cabul rivers, from the British Government, of which they collected the revenue. They cultivated a portion of the lands themselves, the remainder they farmed out to other tribes of the plains as tenants. Many of their clansmen dwelt in the plains of Michnee and some in the neighbouring hills. They traded in the Peshawur valley. The Alunzye Momund, whose head-quarters are at Gundaoo, in the hills, also had a fief of Punjpao in British Doaba, chiefly cultivated by tenants. A few of their men lived in the plains and the majority in the hills. These also traded in the valley. The Pindoe Alee Momund, at a former period, had held a similar jagheer in Doaba; but not since British rule. These have few relations either with the British Government or the people of the Peshawur valley. They inhabit a very strong locality in the hills. The fiefs were originally granted by preceding Governments to the Momunds as black mail to buy off depredation; but molestation was not to be thus warded off; and the Doaba border was not free from Momund marauders. The misdeeds of the Momunds were encouraged by Saadat Khan, who had a grudge against the British for having been parties to his temporary deposition from power during the Affghan war. On the Momund frontier, there occurred, during the years 1850 and 1851, several audacious outrages.

MICRONESIA, a designation proposed by Mr. Logan for part of the Indo-Pacific Islands. The Indo-Pacific islands he names Oceanica.

Under the term *Asianesia*, he describes the great S. E. insular region, which has intimate geographical and ethnical relations with Asia, and which would include Indonesia, Melanesia, Micronesia and Polynesia. *Aino-Japanesia*, is the name that he gives to the distinct and well defined geographic and ethnic N. E. chain that lies along the continent of Asia, and forms a group including the Japanese and Aino islands from Formosa to Kamschatka.

The Indian Archipelago he also proposes to call Indonesia, and to arrange it thus ;

Western Indonesia, including Sumatra, the Malay Peninsula, Borneo, Java, and the intermediate islands.

N. E. Indonesia, Formosa to the Solo Archipelago and all included ; and embracing the Philippine and Bisayan groups, &c. The Southern chain of this has a close ethnic relation, and is throughout the great seat of the piracy of the Archipelago, but chiefly Mindanao, Solo and the crowd of other islands extending from Mindanao to the N. E. Coast of Borneo, and separating the Mindoro from the Solo Sea.

S. E. Indonesia from the East Coast of Borneo to New Guinea, including the Western Papuan islands and the Kch and Aru Archipelagos. In this division are the N. Moluccas, Banda, Ceram, &c. S. Moluccas, and the Kch and Aru

MICRONESIA.

S. Indonesia, the great southern or trans-Javan chain between Java and New Guinea, or from Bali to the Timor Laut group.

Melanesia includes New Guinea, Australia and all the eastern Papua islands.

Papuanesia distinguishes the northern islands inhabited chiefly by spiral haired tribes from Australia.

Micronesia all the islands between Melanesia and the Inchu and Japanese chain.

Polynesia, all the islands of the Pacific to the east of Micronesia and Melanesia as far as Easter island.

Malaya-Land includes all districts possessed by the Malay men of Malaya race and language.

Java-Land, by those of the Java race, and similarly, Sunda Land, Wugi Land and Battu Land.

Mr. Logan regards the Chinese as an agglomeration of several distinct nations, which still retain distinct languages. These nations differ very considerably in their physical characters although much mixture has taken place. The northern or predominant nation appears to him to have a fundamental tendency to an Iranian modification of the Turanian type, and the same tendency is observable amongst the Koreans and the higher classes of the Japanese, as amongst some of the American, Tausugian, and Asianesian peoples. In the south of China, the fundamental tendency is to an extreme flatness of features, the nose being often more insignificant and shapeless than in any other race, although the finer type also occurs. In the eastern maritime province, the northern type is much more common. The dominant or northern Chinese race is much less Mongolian than the S. Chinese, the Malay, and most of the intermediate Ultra Indian races. They are closely allied to the Japanese and Americans and indeed are evidently the same race however much their language differs.

Mr. Logan is of opinion that the Chinese development had a considerable influence in Eastern and Mid-Asia, the Aino-Japanese band, Micronesia, and probably Asianesia generally. It has a strongly marked physical relation not only to all the races of the Mongolian type, but in a much closer or more special manner to the Tibetan tribes, the American Indians and some of the Eastern Asianesian tribes, in all which one of the prevailing Chinese types may be traced. Numerous examples of the elongated head, the densely wedge shaped cranium, and arched nose of America and New Zealand may be seen in every assemblage of Chinese in Singapore. The occipital truncature remarked in Ameri-

MIDN APORE.

ca and Polynesia, is common in S. E. Asia. It is very strongly marked in the Lau race. The Tibetan tribes have the rise of the skull at the coronal region but the other characteristics are common. The heads of the American men in plates 30, 31, 35, 36, and 37 of Dr. Prichard's Natural History of man are Chinese. The prominent lateral expansion of the zygomæ, is common in the Chinese race as in the Americans. The Sumatra Malays have much more frequently the typical Mongolian head as have also the allied tribes of the Irawady basin, with whom they are most nearly connected and whence they have undoubtedly derived their physical stock.—*Mr. Logan in J. I. A.* 1850-58. See India.

MICROPUS. See Birds.

MICRORHYNCHUS SARMENTOSUS.

A sand binding plant growing on the shores of the Bay of Bengal.

MICROSCOPIC WRITING. Layard's latest work on Nineveh shows that the national records of Assyria were written on square bricks, in characters so small as scarcely to be legible without a microscope; in fact, a microscope was found in the ruins of Nimrod.—*Curiosities of Science*, p. 42.

MIDA, according to Colonel Todd, the three great branches of the Indu or Lunar Aswa races, Puru-medæ, Uja-medæ, and Deo-medæ had the surname of Mida, pronounced Medæ, and he supposes them to be the Aswa invaders of Assyria and Media.

MIDDAY KEERAY. TAM. *Asystasia coromandeliana*.

MIDDLETON, Sir Henry, an officer in the Maritime Service of the English E. I. Company, who commanded in their sixth voyage, in 1610.

MIDGE. The rein-deer is tormented by two kinds of Gad-fly (*Æstrus*), also by the mosquito, which is similar in appearance to the midge or gnat; in wooded and low situations these insects swarm about the creatures literally in clouds.

MID HIMALAYA, a term proposed by Alexander Cunningham to designate a parallel range of the western Himalaya. Another range he designates the Outer or Sub Himalaya and lower down is the Sewalik. See Himalaya.

MIDNAPORE one of the largest and most important districts of Bengal. The town is 69 miles from Calcutta by a good road. The population of the district is estimated at 1,200,000. The existing and projected canals in India are numerous. Midnapore is proposed to be saved from famine by leading in the Selye river, and Bengal is to be protected by a system of

MIDSUMMER ROOT.

channels from the Gundak river through the districts of Chumparum, Sarun and Tirhoot. At a cost of 300,000£, a canal is to connect Calcutta with Raneeganj, a distance of 300 miles, and its cost will be cheaply delivered. The Ganges canal has branches to Cawnpore, Futtelghurh and Etawah. A channel is to be led from the Ramgunga. A canal leads from the Sardah river into Oudh. The Bari Doab canal is proposed to be extended by forming a dam across the Sutlej at Hurookee. The western Jumna canal is to be enlarged towards Sirsee. The Sutlej canal projected in 1861 is to take up the irrigation where the Jumna ceases to provide for it and for this purpose, will supply the tract west of the Markunda Irrigation. There are great canals of the Ganges, Jumna and Barce Doab, and anicuts on the Godavery, Kistnah, Ponnar and Cauvery. The Mauri Conwai river in Mysore with the Nundoor Secerannulwara and Maschully reservoirs. Great canals in Sind, embankments in Bengal and Burmah, a dam across the Kistnah river in the Dekhan, one across the Girna in Kandesh, and a similar dam across the Taptee to provide irrigation for Khandesh. In Sind, is the great Bigareo canal, for the enlargement of which a resolution was come to and it has been proposed that all the inundation channels of that province should be converted into perennial flowing streams. A reservoir has been constructed near Sholapore at a cost of £20,000. Large works have been planned for Guzerat and the Dekhan, and others for the Central Provinces; for works from the Pench river north of Nagpore, and from the Warda river to its south, and the waters of the Betwa river are to be led to irrigate Bundelcund which has been fifteen times desolated by famine in the last three centuries: one third of the water will go to the Patiala State. It will require two millions to irrigate the lands between the Jumna and the Barce doab canals.—*Friend of India. Annals of Indian Administration*. See India. Kol.

MIDSUMMER FIRES. See Baal.

MIDSUMMER ROOT.

In China, two or three aroid plants are gathered in the middle of summer and have received this name. The plants employed are *Pinellia tuberifera*, *Arisaema ternatum*, *Arum macrorrhizum* and other aroid plants. Their poisonous properties are exhausted by soaking and drying and are then used as sulphate of potash.—*Smith*.

MIGRATION OF BIRDS.

MIEDZ. Pol. Copper.

MIEL. Fin. Sp. Honey. Amongst the words of Indo-Germanic origin which M. Remusat gives to prove affinity between the Finnish and Samoyede language is "Miel, Mod, in the Caucasian tongue and Med, in the Slave," and which, as well as mead, the drink of the Scandinavian warrior, is from the Sanscrit Madhu, a bee. Hence an intoxicating beverage is termed Madhya, which supplies another epithet for Krishna, Madhu or Madhava.—*Tol's Rajasthan*, Vol. I. p. 529.

MIELE, It. Honey.

MIEN-GA. BURM. Gynometra, *sp.*

MIEN, according to Colonel Barney and Lan meen according to Buchanan, are the Chinese names of Burmah.

MIEN-MO, See Meru.

MIETTI, Cyno. Wax.

MIGLIO, It. Millet.

MIGNONETTE, *Roseda odorata*, is a general favorite in all countries, and may be grown in great luxuriance on the plains during the cold months, does not like to be transplanted, and ought invariably, whether in pots or flower beds, to be sown where intended to flower: requires an open soil and free drainage, sometimes lives through the hot season, if sheltered by a high building.—*Jaffrey*.

MIGRATION OF BIRDS, the great migration of birds to and from Southern Asia, says Mr. Hodgson, seems to take place across the mountains of Nepal. The wading and natatorial birds, generally, make a mere stage of the valley, on their way to and from the vast plains of India and Tibet, the valley being too small, dry, open, and populous for their taste—especially that of the larger ones. Some, however, stay, for a longer or shorter time, in their vernal and autumnal migrations: and some, again, remain throughout that large portion of the year in which the climate is congenial to their habits. Of all of them, the seasons of arrival both from the north and from the south, are marked with precision: and Mr. Hodgson was led to conclude from what he observed there, that the mass of the gallatores and swimmers are found in the plains of India, only during the cold months: for they all arrive in the valley of Nepal, from the north, towards and at the close of the rains; and all as regularly reappear from the south upon, or soon after, the cessation of the hot weather. In his enumeration of them, therefore, he divides the migratory birds into the following three classes:—

MIGRATION OF BIRDS.

1st.—Such as usually pass over the valley, seldom alighting, and only for a few hours.

2nd.—Such as alight and stay for a few days or, at most, weeks.

3rd.—Such as seem to seek the valley, not as a caravansary merely, or house of call, for momentary or temporary sojourn on their way to some remote abode—but, as their permanent dwelling place for the entire season.

4th.—Such as do not appear to migrate at all; notwithstanding that all their nearest kindred (so to speak) do so regularly.

The migrations of birds has been the theme of poets and naturalists in all ages. Mrs. Hemans, asks of the swallows,

Birds, joyous birds of the wandering wing,
Whence is it ye come with the flowers of spring?
"We come from the shore of the green old Nile,
From the land where the roses of Sharon smile,
From the palms that wave through the Indian sky,
From the myrrh-tree of glowing Araby.
"We have swept o'er the cities, in song renown'd,
Silent they lie, with the deserts round!
We have crossed proud rivers, whose tide hath roll'd,
All dark with the warrior blood of old;
And each worn wing hath regained its home,
Under the peasant's roof-tree, or monarch's dome."
And what have ye found in the monarch's dome,
Since last ye traversed the blue sea's foam?
"We have found a change, we have found a pall,
And a gloom o'ershadowing the banquet's hall,
And a mark on the floor, as of life-drops spilt,
Nought looks the same, save the nest we built!"
Sad is your tale of the beautiful earth,
Birds that o'ersweep it in power and mirth!
Yet, through the wastes of the trackless air,
Ye have a guide, and shall we despair?
Ye over desert and deep have passed,
So shall we reach our bright home at last!

Another poet thus alludes to the migration of swallows:

"As fables tell, an Indian sage,
The Hindoostani woods among,
Could, in his desert hermitage,
As if 't were marked in written page,
Translate the wild bird's song.
"I wish I did his power possess,
That I might learn, fleet bird, from thee,
What our vain systems only guess,
And know to what wide wilderness,
You go across the sea!"

The Jackdaw, *Corvus monedula*, of Europe, Siberia, Barbary, W. Asia, Peshawar valley, and Kashmir, may be seen in flocks in winter in the northern frontier of the Panjab, associated with the Cornish chough and the rook. The first two come from Cashmere, where they are found in great abundance, during the summer; but the rook, if ever seen in Cashmere, is only a cold weather visitor and seems to come from the west, inasmuch as it is said to be common in Afghanistan. It appears at Rawul Pindie

MIGRATION OF BIRDS.

in flocks about the beginning of September, it is found in winter as far south as Lahore and disappears entirely in March. The hooded crow has been brought from Northern Afghanistan, and is mentioned by Lieutenant Wood in his travels as common in Kunduz, but it is not found in Cashmere or in the Panjab. The chimney swallow makes its appearance in October and leaves again for the straw built sheds of Cashmere, where it breeds and spends the summer months. The white rumped martin and sand martin are both likewise migratory, and repair to Cashmere and Ladakh in summer. The black and alpine swifts remain longer, and may be seen careering about during the summer evenings, especially after a shower of rain. The ring-dove is a resident on the sub-Himalaya. The common starling is plentiful in the north as elsewhere in Hindustan. The lapwing, *Vanellus cristatus* arrives in flocks in the beginning of November, and departs for the west early in spring; its summer residence has not been found out, but it must be common in certain parts of Persia and Afghanistan. The common and jack snipe, with a few painted snipe, appear in the Rawul Pindie in February and March, and are procured as many as thirty couple at a time.

Nearly all the water fowl met with in the rivers and marshes of the north-west come from the Tartarian lakes, where they may be found breeding.

After a sultry day it is usual to see the wire-tailed swallow skimming over the plains, and by the side of pools and streams a solitary green sandpiper, *Totanus ochropus*, is not rare. The brown backed heron, *Ardeola leucoptra*, also occurs in such situations. The black ibis (*G. papillosus*), with its red crown, is seen during the cold months flying along with the rooks and European jackdaws, and besides, on the marshes about, the great and little bitterns, with the spotted tail, are not uncommon. Of the other European birds may be noticed the short-eared owl, moor buzzard, the pale harrier, *Circus swainsonii*, the cormorant, ruff, and sniew, all coming and departing with the winter months.

Gangsir, Gung Knr, Chaloong, Toong Toong—comprise the numerous wild fowl, of Tibet, swimmers and waders, which migrate from India in March and April, and return in October and November; they are all eaten, but not extensively. There is a prejudice against killing them; but as they all breed on the lakes and rivers of the country and are very numerous, the eggs are found in great quantities, the people who live by gathering and selling these eggs never rob a

MIHTAR.

nest of all its contents, but take about half the eggs. This forbearance arises from the general aversion to taking life which prevails in Tibet and it has its reward as it is supposed that the birds if entirely deprived of their young, would not again return. The Messrs. Schlagentweit, however, state that there are no migratory birds in the Himalaya; that nowhere and at no season saw they flocks crossing the Himalaya, as many birds of Europe cross the Alps, between Italy and Germany. The Himalayan birds do not change their abodes on a large scale; the various different heights themselves afford them the opportunity to select the climate they require in different seasons. In the plains of India, however, chiefly in Bengal, a large number of birds disappear during the breeding time, they do not, however, leave India altogether but select their abodes in the lower, impenetrable jungles of the delta of the Ganges and Brahmapootra, called the Sunderbans, where they were found by Hermann Schlagentweit in large quantities, whilst at the same time they had entirely disappeared in Bengal proper.—*Hodgson, Esq., in the 18th Volume of the Asiatic Researches*, Part II., 122. Adams.

MIGRATION OF RACES. Besides the familiar instances of the Samaritans and Jews transplanted under the Assyrians, Persian history repeatedly shows the deportation of whole tribes, expressly termed *ανακτορι* by Herodotus. The Pæonians were removed to Phrygia, the Bæcæans from Africa to Bactria; the Milesians to Ampe, near the Tigris; Egyptians to Sasa; Etruscans from Eubœa to Ardericca and to Gordœyn, and of Antiochians to Mahuza Herodotus, and Strabo quoted. In the winter of 1863-4 when the Circassians, finally overcome, resolved to quit their country, they moved in great bodies into the Turkish dominions, and it was supposed that above 300,000 would so arrive. Perhaps the numbers in the migration of the Celtic Irish westwards to America exceeds all known instances. The migratory tribes of India, Bhourah, Sansi, Harni, Kanjar, Dhanuk, have ostensibly humble avocations, but are great robbers. It would be of value to know whether any of them are settling down to town life, as many of the gipsies in Britain have done.—*Elliot's Hist of India*. Campbell 126.

MIKADO. or spiritual emperor of Japan, also called Dairi or Dairisama. The Mikado is head of the religion of the country, and the Tycun, Zeogun, or Kobo, the chief of the State, who holds his court at Jeddo. About B. C. 600 Japan was ruled by Zin-mu-tin-wu, or the divine conqueror, who was a Chinese warrior and conqueror and the founder of the Mikado dynasty, which about the 16th century became set aside from temporal affairs. See Kobo, Japan, India.

MI-KHYOUNG. See India.

MIKIR, a mountain race, to the south of the valley of Assam in lat. 26° 20' N, and between lon. 93° and 94° East. They are to the north-west of the Naga tribes and N. E. of the Kuki. The Mikir tribe are partly hillmen and partly lowlanders, occupying a considerable area in the Assam district of Nowgong and in Northern Cachar. Their numbers are computed at 26,000. The Mikir inhabit the lower part of the Khassiah and Jynteah hills. They flit from place to place every four or five years to cultivate cotton and rice. They build houses on platforms, drink spirits, eat opium and are either unbelievers or imperfect converts to hinduism: delight in festivals and in their attendant drunkenness, they eat beef and pork, and fowls are sacrificed to the sun, moon, and invisible deities attached to trees; their physiognomy and dress is that of the people of the Khassiah Hills, to whom the Mikir seems to be allied, and perhaps the Naga, the Garo, the Khassiah, Jaintia and Mikir are all allied. The Mikir of North Cachar are mild and little courageous though they carry the dhao and spear. The tract of country situated in the Nowgong district, called the Mikir Hills, extends from the Kulcanoe river east to the Joommoonah river west of Dabboka, about sixty miles in length, or seven day's journey. On the north, the Mikir hills are bounded by the plains of the Mikirpar Mahal, the Mongahs of Rangobegur, Kageerunga, and Bokakhat. From north to south, to the Jummoonah river, the distance in a straight line may be thirty-five or forty miles. The Mikir villages and cultivation extend eastward only as far as the Kulcanoe river in Morung. Beyond that river the Rongmah boundary commences, and terminates with the Dhanseerree river, separating Nowgong from the Seebagar district. The Mikir generally inhabit the interior portion of the hills, but a majority of these villages are within a day's journey of the plains. According to the tradition of the tribes, they were

MIKIR.

originally settled in Tooleeram Senaputtee's territory. As the Mikir take up fresh land every two or three years, and remove their dwellings to different parts of the hills, it is necessary to make a new settlement every year with their chiefs. No correct census of the Mikir population to this day has been taken; but from the revenue statement given in by the Mikir chiefs for the year 1851-52 there are, in the Mikir hills 1,494 houses, in Northern Cachar, 356 houses so that the population for the whole tribe in the Mikir hills and Northern Cachar, may amount to about 9,250 persons. The houses vary in size according to the number of families residing under one roof. Some are thirty, some forty feet long, and twenty feet wide, with the grass roof brought down almost to the platform. The whole building consists of one large room; they keep their grain in baskets in the room, and men, women, and children, all lie down together on their respective mats in their allotted places; they wear a small piece of cotton cloth round the waist, which extends nearly to the knees, and the women in their villages do not cover the breast. They are, chaste, and in morals superior to the people of the plains. They are said to worship the sun and moon, and make sacrifices to both, of hogs, goats, and fowls but these sacrifices may be considered more in the light of feasts, as the portion allotted to the deity is very scanty and composed of the refuse parts. They also sacrifice to rivers, and large stones, or trees, in their neighbourhood, which are considered the abode of the deities. On the appearance of any epidemic amongst them, they have recourse to sacrifices. Unlike most hill tribes the Mikir seem devoid of anything approaching to a martial spirit. They are a quiet industrious race of cultivators, and the only weapons used by them are the spear and dao hand bill, for cutting down jungle.

The Naga, Mikir, Kachari, Garo and Khassiah are the five races, in whose possession chiefly are the broad highlands of the Assam chain extending from the N. E., near the head of the Kynduayn and Namrup, on one side, along the valley of the Brahmaputra to its southern bend round the western extremity of the chain, and on the other side, south westerly, along the valley of the Burak and Surma. These highlands are thus embraced by the valleys of the Brahmaputra and its affluents on all sides but the S. E., where they slope to the Kynduayn. The Naga dialects are

MILDEW.

Nogaung, | Angami | Muzame An-
Khari, | and | gani.

On the west, the Naga march and intermix with the Raug-tsa, a branch of the Kachari or Bodo.

The Khassia is distinguished from all the surrounding languages, Indian, Ultra-Indian, or Tibetan. It is a fragment of the Mon Kambojan formation of languages, and is a remnant of an older formation which preceded the Burma-Tibetan in Northern Ultra-India.

The valley of Assam and its bordering hills are remarkable for the number of populations which they contain. Amongst these are the Bodo or Borro of Assam and Cachar, Garo, Kasia, Mikir, Aka, Dofla, Abor, Miri, Bor, Abor, Mishmi, Muttuk, Singpho, Jili, Naga, Changlo, Bhot, and Kuki. On the south it is bounded by the Garo, Kasia and Jaintia hills, then the lands of the Naga in north Cachar and Naogong; then those of the Singpho up to the great bend of the Brahmaputra. All their native populations are more or less akin to the peoples of the Burmese empire. On the Southern Assam frontier we have the numerous Naga and Singpho dialects, the Mikir and Angami, the languages of the Khassia and Jaintia hill-men, the Boro in Cachar, and the Garo in the hills of that name. The Kuki occupy parts of Tipperah and Chittagong and the Mag race are in Arrakaa and Chittagong. —Latham's *Descriptive Ethnology*, *Butler's Travels and Adventures in Assam*, pp. 126 to 138. *Ann. Ind. Adv. Vol. VII.* p. 63. See Joboka, Kuki, Khassya, Naga.

Serbia ...	2,500	985,000	891,400
Switzerland ...	—	—	—

The cost of the British soldier in comparison with the soldier of other countries is largest. After England comes France with her conscription, paying little more than half the sum paid by Great Britain. Italy is next on the list, and then Spain. All the other States pay less than 40£. per man. Sweden it will be seen, has more soldiers in comparison to the number of inhabitants than any other country—1 in 56. Holland comes next, with 1 out of 60. Between France and England a considerable difference exists, France taking 1 out of 73 inhabitants, England but 1 out of 97.

The Chinese make no use of milk, either crude, nor in the shape of curds, butter, or cheese: the young animals are allowed the whole produce of their mothers; the Chinese have no repugnance at killing of cows, nor indeed to killing and eating anything else. Milk of cows, goats, &c., is little used as an article of diet in Southern Asia. It may even be said that aversion to milk as an article of food obtains among nearly all the Chinese, Indo-Chinese and Malay races, including specifically the Khasia of the Eastern frontier of British India, the Garo and Naga, the Burmese, the Siamer, the Javanese; and Sir John Bowring in a letter published in the Journal of the Statistical Society, mentions that the same aversion prevails in China. The Brahui and Belochi nomades in the Peshin valley, though they will give milk in exchange for other commodities, yet they consider it a disgrace to make money by it. With the Arabs the term "labban" (milk-seller) is an opprobrium and a disgrace. They will give or exchange, but not sell milk. Possibly the origin of the prejudice might be the recognising of a traveller's guest-right to call for milk gratis. No one will sell milk even at Meccah, except Egyptians, a people supposed to be utterly without honour. As a general rule in the Hejaz, milk abounds in the spring, but at all other times of the year it is difficult to be procured.—*O'Shaughnessy* p. 690. *Moor*, p. 140. *Yule's Mission*, p. 2. *Burton's Pilgrimage to Meccah*, Vol. i p. 362-63. *Wall* i. 42. See Abishegam.

MILK OF PALM NUTS. Is a popular term, for the albumen of the seed when in a liquid state: and which, when the fruit is

MILLET

quite ripe, appears as a solid white or yellowish mass, and is then termed the kernel. This albuminous fluid or water when the nut is taken from the tree early in the morning and whilst the dew is still upon it, is a cool and delicious draught. It is slightly effervescent and gently aperient *Seeman*.

MILLET.

The millets belong to the natural order *Panicaceæ*,—the *Graminaceæ* of Lindley, the grass tribe and the species chiefly used as food for man are as under:

<i>Paspalum stoloniferum.</i>	<i>Pennisetum barbatum.</i>
<i>Panicum miliaceum.</i>	<i>Sorghum vulgare.</i>
" <i>miliare.</i>	" <i>saccharatum.</i>
" <i>italicum.</i>	" <i>glabrum.</i>
<i>Opismenus frumentaceus</i>	" <i>bi-color.</i>
<i>Zea mays.</i>	" <i>cernuum.</i>
<i>Oryza sativa.</i>	<i>Eleusine coracana.</i>
<i>Triticum vulgare</i> (var.	" <i>stricta.</i>
<i>aestivum</i> and <i>hybernum</i>)	<i>Hordeum vulgare.</i>
<i>Secale cereale.</i>	" <i>hexastichon.</i>
<i>Panicum spicatum.</i>	" <i>distichon.</i>

Millets of various kinds are met with in the hottest parts of Africa, in the South of Europe, in Asia Minor and in the East Indies. In India they hold a rank second to rice alone, and those chiefly cultivated are as follows,

Botanical Names.	English.	Hindoostanee.	Tamil.
<i>Setaria italica.</i>	Italian millet.	Kahn kangnee..	Tenny.
<i>Setaria germanica.</i>	German millet.	Kora kang.
<i>Panicum miliaceum</i>	Common or Italian millet.	{Sawee, checha } {Warree }	Varagoo.
<i>Pennisetia spicata.</i>	Spiked millet.	Bagree.	Camboon.
<i>Sorghum vulgare</i>	Great millet.	Jowaree	Cholun.
<i>Sorghum saccharatum</i>
<i>Eleusine coracana</i>	Raggy	Natchore Ragree	Kavaroo.

The native West Indian species are *P. fasciculatum* and *P. oryzoides*. *Setaria Germanica* is the most common in America, where millet is chiefly grown for making hay, half a bushel of seed to the acre is the usual quantity, sown broadcast and harrowed in, but to procure the finest quality of hay, an additional three or four quarts of seed is sown. The ordinary yield of crops is about a ton to a ton and half of hay to the acre, but it should be cut as soon as it is out of blossom, for if it stand later, the stems are liable to become too hard to make good hay. In Southern India, there are three kinds of Jowaree, white, green, and red, the straw is of great bulk and goodness, and furnishes good provender for cattle, being preferable to that of rice. It is however given dried, as the green plant is injurious. Among culmiferous plants and legumes used in the East, are the *Panicum italicum*, *Eleusine coracana* (the meal of which is baked and eaten in Ceylon under the name of Corakan flour), and *Paspalum* of several varieties. The pigeon pea (*Cytisus cajan*;) is cultivated throughout India, and a very valuable and prolific species of bean, called the Mauritius black bean (*Mucuna utilis*), growing even in the forest soil,

MILLET.

is cultivated in India and Ceylon. *Sorghum vulgare* is the principal grain of Southern Arabia and the stems are also used extensively for feeding cattle. The plant bears the Hindi name of jowar, or jwari, and is cultivated throughout Western Hindoostan, and in most parts of the western Dekhan, between the Nerbudda and the Godavary. In China, the *Setaria Italica*, the *S. Glauca*, the *Panicum miliaceum*, *Sorghum vulgare* and *Sorghum saccharatum* are all cultivated. Millets are known to Europe as petit mais, or tropical crops. In India, they form a great part of the food of the people everywhere but on the sea board, in the valleys and on the banks of rivers, perhaps as much as rice and more than wheat, and in Egypt perhaps, surpass all other crops in importance. In Western Africa they are the staff of life. The red and white millets shown by Austria, Russia and the United States, at the Great Exhibition of 1851 were beautiful, and Ceylon exhibited fair samples. Turkey abounds in small grains. *Panicum miliaceum*, *P. frumentaceum* and *glabrum* are all grown in the East Indies and China. London says there are three distinct species of millet, the Polish, the common or German, and the Indian. *Setaria Germanica* yields German millet. The plants are readily increased by division of the roots or by seed, and will grow in any common soil. The native West Indian species are *P. fasciculatum* and *P. oryzoides*.

In the United States, the *Setaria germanica* millet is chiefly grown for making hay, being found a good substitute for clover and the ordinary grasses. The plant flourishes well on rather thin soils, and it grows so fast that when it is up and well set it is seldom much affected by drought. It is commonly sown there in June, but the time of sowing will vary with the latitude. Half a bushel of seed to the acre is the usual quantity sown, broadcast and harrowed in. For the finest quality of hay, it is thought advisable to sow an additional quantity of three or four quarts of seed. The ordinary yield of crops may be put at from a ton to a ton and a half of hay to the acre. It should be cut as soon as it is out of blossom; if it stand later, the stems are liable to become too hard to make good hay. It grows ordinarily to the height of about three feet, with compact heads from six to nine inches in length, bearing yellow seed. The sub-varieties of this, are the white and purple-seeded. The Italian millet, *Setaria italica*, is larger than German millet, reaching the height of four feet in tolerable soil, and its leaves are correspondingly

MILLET.

larger and thicker. The heads are sometimes a foot or more in length, and are less compact than the German, being composed of several spikes slightly branching from the main stem. It derives its specific name from being cultivated in Italy, though its native habitat is India. It is claimed by some that this variety will yield more seed than any other, and the seed is rather larger, but the stalk is coarser, and would probably be less relished by stock. If the greatest amount of seed is desired from the crop, it is best to sow it in drills, two to two-and-a-half feet apart, using a seed drill for the purpose. This admits of the use of a small harrow or cultivator between the rows, while the plants are small, which keeps out the weeds. The crop will ripen more uniformly in this way than broadcast, and enables the cultivator to cut it when there will be the least waste. The seed shatters out very easily when it is ripe, and when the crop ripens unequally it cannot be cut without loss because either a portion of it will be immature, or, if left till it is all ripe, the seed of the earliest falls out. It should be closely watched and cut in just about the same stage that it is proper to cut wheat, while the grain may be crushed between the fingers. It may be cut with a grain cradle, and, when dry, bound and shocked like grain; but it should be threshed out as soon as practicable, on account of its being usually much attacked by birds, many kinds of which are very fond of the seed. The seed is used in various European countries as a substitute for sago, for which it is considered excellent. It is likewise a valuable food for poultry, particularly for young chickens, which from the smallness of the grain can eat it readily, and it appears to be wholesome for them. In some countries millet seed is ground into flour and converted into bread; but this is brown and heavy. It is, however, useful in other respects as a substitute for rice. A good vinegar has been made from it by fermentation, and, on distillation, it yields a strong spirit. The sugar millet seed—the produce of *Sorghum saccharatum*—is used chiefly for puddings; by many persons it is preferred to rice. It is cultivated largely in China and Cochin-China. The stalks, if subjected to the same process that is adopted with the sugar-cane, yield a sweet juice, from which an excellent kind of sugar may be made. Millet will grow best on light, dry soils. The ground being first well prepared, half a bushel of seed to the acre is ploughed in at the commencement of the rains in India. The crop ripens within three months from the time of sowing. The usual produce is about 16

MILLET.

bushels to the acre. The Canary Islands export annually about 212,400 bushels of millet.

Sorghum vulgare; Great Indian Millet, Juari, Cholum or Guinea Corn,—is a native of India. It is the *Sorghum vulgare*, the *Andropogon sorghum* of Roxburgh, and produces a grain a little larger than mustard or millet seed. It is grown in most tropical countries, and has peculiar local names. In the West Indies, where it is chiefly raised for feeding poultry, it is called Guinea corn. In Egypt it is known as Dhurra, in Hindostan and Bengal as Joar or Juari, in the Tamil country as Cholum and in some districts as Cush. In Lower Siud joar is very extensively cultivated, as well as bajree (*Holcus spicatus*). It is harvested in December and January, requires a light soil, and is usually grown in the east, after *Cynosurus coracanus*. Of the three kinds, known as white, green, and red, juari, the red ripens a month earlier than the rest, or about four months from the time of sowing at the close of May or early in June. A gallon and a third of seed is sown per acre, and the produce averages 16 bushels. This grain, though small, and the size of its head diminutive, compensates for this deficiency by the great bulk and goodness of its straw, which grows usually to the height of 8 or 10 feet. It is sometimes sown for fodder in the beginning of April, and is ready to cut in July. It is said to be injurious to cattle, if eaten as green provender, the straw is therefore first dried, and is then preferable to that of rice. This grain is frequently fermented to form the basis, in combination with goor or half made sugar, of the common arrack of the natives, and in the hills is fermented into a kind of beer or sweet wort, drunk warm.

Holcus spicatus, the *Panicum spicatum* of Roxburgh, is cultivated throughout India. From one to four seers are sown on a biggah of land, and the yield is about four maunds per acre. It is sown after the heavy rains commence, and the plough serves to cover the seed. The crop is ripe in three months, and the ears only are taken off at first. Afterwards the straw is cut down close to the surface of the soil, to be used for thatching, for it is not much in request as fodder. Being a grain of small price, it is a common food of the poorer class of natives, and really yields a sweet palatable flour. It is also excellent as a fattening grain for poultry. The *Poa Abyssinica* is one of the bread corns of Abyssinia. The bread made from it is called tell, and is the ordinary food of the country, that made from wheat being only

MILLINGTONIA.

used by the richer classes. The way of manufacturing it is by allowing the dough to become sour, when, generating carbonic acid gas, this serves instead of yeast. It is then baked in circular cakes, which are white, spongy, and of a hot acid taste, but easy of digestion. This bread, carefully toasted, and left in water for three or four days, furnishes the boza, or common beer of the country, similar to the quas of Russia.

Sorghum vulgare and *Penicillaria spicata*, constitute the chief food grains of a considerable proportion of the people of India. Taking British India as a whole, it is only the rich or well to do classes who can afford to employ rice and wheat. The following show the composition, in 100 parts of the white and red *Sorghum vulgare*.

—*Catalogue Exhibition of 1862. Simmons's Commercial Products. Smith's, Chinese Materia Medica, Roxburgh's Flora Indica; Voigt, Hortus Suburbanus Calcuttensis; Madras Exhibition Juries Reports.*

MILLINGTONIA, Dr. Roxburgh restored this name to the system by assigning it to two timber trees, which at that time, as he expresses himself (Fl. Ind. i. p. 102), constituted this strongly marked family, of which

MILLINGTONIA HORTENSIS.

one species *M. simplifolia*, was figured in t. 254 of his Coromandel plants; and with it, another species described in the Flora Indica. In 1824, Dr. Wallich sent to England what he considered three more species; *M. dillenifolia*, *pungens*, and *integrifolia*; of these the two last appear to be identical, for no great reliance can be placed on the entireness of the leaves, as some with entire and spinulose margins may occasionally be seen on the same specimen. *M. pinnata* was procured from Silhet, *M. simplicifolia* and *pungens* from that district, and the entrance into Nepal, the two last were also found by Dr. Wight, the first on the Neelgherries, and the second on the mountains of Madura, *M. dillenifolia* Dr. Wallich obtained from Chundraghery, and other elevated mountains in Nepal. The trees Dr. Royle met with belong to Dr. Wallich's two species *M. dillenifolia* and *pungens*; the former found about Dhunootree and Simla, between 6,000 and 7,000 feet of elevation; and *M. pungens* is common about the rivers below both the Mussooree and Suen ranges. To this is allied another tree found in the valley about Mugra, which Dr. Royle called *M. acuminata*, but it may only be a variety of *M. pungens*. This genus, therefore, consisting of four or five species, is spread over a considerable extent of territory from 10 to 31½° northern latitude, or from the Nilgherries and Madura, along Silhet and the foot of Nepal to Mussooree and Simla, and has been formed into an order, and an excellent account given by Messrs. Wight and Arnott in Jameson's Journal for July 1833, p. 178; at which time they state (Prod. Fl. Indiae Penins. p. 115) they had not seen the similar remarks made by Jack (Mal. Misc. 2, p. 32.) The authors observe, that the habit of the species of *Millingtonia* is much that of *Semecarpus*, *Mangifera* and *Buchanania*; it may be added, that in inflorescence they also resemble the mango. A species of this genus called *Ranunculella*, by the Singhalese, grows in the western province of Ceylon, the wood of which weighs lbs. 48 to the cubic foot, and is estimated to last 20 years. It is used in common house buildings. The sticks make excellent fences.—*Royle III. Him. Bot. p. 139. Mr. Mendis.*

MILLINGTONIA HORTENSIS, Linn. fl.

Bignonia suberosa, Roxb.

This grows throughout India and Ceylon, it is an elegant tree growing to the height of fifty feet, is in blossom towards the close of the rains, and the seeds ripen in March. The bark is of a soft spongy nature, the wood is white, firm, and close grained.—*Thw., Dr. Riddell, Enum. pl. Zeyl, p. 206.*

MIMANSA.

MILLINGTONIA SIMPLICIFOLIA, Roxb.

This tree grows in Madurā, Nepal, the Khasya hills, and is found in the forests of the Pegu valley, but scarce. Its properties as a timber are valuable from its weight and strength. Wood white colour and adapted for every purpose of house building.—*Royle Voigt, Hort. Suburb. Calcut. Dr. McClelland.*

MILL STONES.

Circular stones, for grinding corn and other articles.—*Faulkner*; *McGulloch's Commercial Dictionary*, p. 800.

MILNEEPEN also Proppen, Dut. Vermicelli.

MILULU MALAYALA. A tree that grows to about sixteen feet high, and ten inches in diameter. It is used by native carpenters for boats' knees and timbers, on account of its strength.—*Edge, Mal. and Can.*

MILUM. A glacier in the Himalaya, 8 to 10 miles in length and 3,000 feet broad.

MILVUS. The relentless persecution by gamokeepers has now very nearly extirpated, as a permanent inhabitant of Britain, that fine handsome bird, the common European kite (*Milvus regalis*); it was numerous in England in the days of the Tudors. The Seavenger Kites of India (*M. Govinda*) remind the British exile in this country of his distant home in the west. Hamilton Buchanan remarks that, when gorged, this bird delights to sit on the entablature of buildings, exposing its back to the hottest rays of the sun, placing its breast against the wall, and stretching out its wings exactly as the Egyptian Hawk is represented on the monuments.—*Sir James Emerson, Tennent's Sketches of the Natural History of Ceylon*, p. 246.

MIMANSA, in hinduism, a school of philosophy, which investigates the doctrine and practices of the Vedas. The Hindus boast of six different schools or systems of metaphysical philosophy. They are called the Purva Mimansa, Uttara Mimansa or Vedanta, the Sankhya, the Patanjala the Nyayika, and the Vaisheshika: these, although some of them offer irreconcilable contradictions to essential doctrines of their religious belief, are recognised by the brahmans as orthodox, and attributed to authors of saintly reputation. There are other schools, as those of the Charvaka, Buddhist, and Jain, which, although in some respects not more at variance with received opinions than the

MIMANSA.

preceding, are stigmatized with the reproach of infidelity and atheism. The cause of this difference is sufficiently obvious, and is characteristic of a state of feeling which prevails as much in the present as in any former period. The orthodox schools of philosophy do not disparage the authority of the Vedas, they do not dissuade the celebration of the acts of formal devotion which the Vedas or Puranas enjoin, although they argue their utter inefficacy as means of final and permanent felicity. They recommend their performance, however, as conducive to that frame of mind in which abstract contemplation may be safely substituted for devotional rites, and even admit of external observances after the mind is in pursuit of true knowledge, as long as such ceremonies are practised from no interested motive, as long as they are observed because they are enjoined, and not because any benefit is either to be expected or desired from their practice. Again, the writings of the orthodox philosophers meddle not with existing institutions, and least of all do they urge or insinuate any consideration to detract from the veneration, or trespass upon the privileges, of the brahmans. As long as these precautions were observed, the brahmans did not, nor would they now object, to any form of doctrine having in view the establishment of merely abstract propositions. The case was very different with the heterodox schools. They went from abstractions to things. The Charvaka condemned all ceremonial rites, ridiculed even the *smadha*, and called the authors of the Vedas, fools, knaves, and buffoons. The Buddhists and Jains denied the inspiration of the Vedas and the sanctity of the brahmanical character, abrogated the distinction of caste, invented a set of deities for themselves, whom they placed above those of the hindu pantheon, and organized a regular hierarchy, a priesthood, and a pontiff; an institution still subsisting in the trans-Indian countries, of which the grand Lama of Tibet is the head. It is a remarkable historical fact, that this organization was found too feeble to oppose, in India, the apparently loose and incoherent, the undisciplined, the anarchical authority of the brahmans. It had, however, the effect of exciting their apprehensions and their hatred to such an extent that it became proverbial with them to say, "If your only alternative be to encounter a heretic or a tiger, throw yourself before the latter, better be devoured by the animal than contaminated by the man." There may be a few of the Charvaka sect in India, but their opinions are unavowed. The Buddhists have numbers and

MIMANSA.

influence in the west of India, but are little heard of elsewhere, in India though numerous in Ceylon, Tibet, Burmah, Siam, Cambodia Cxhen China, China and Japan.

Besides the above acknowledged schools or systems of philosophy, there is the Panranik or system of the Paranas. It is not considered one of the number of regular schools, and does not claim the character of a system, but it presents a peculiar scheme of doctrine on metaphysical subjects and exercises more influence over popular opinion than any of the rest. It may also be termed the eclectic school as it has evidently derived its principles from different systems and formed them into a miscellaneous combination of its own contrivance. It is not put forward as a new scheme, but is subsidiary to the popularization of particular objects of worship for which the Paranas seem to have been composed. The Vedas are authority for the existence of a Divine Being, supreme over the universe and existing before all worlds. "In the beginning," it is said, "this all (this universe) was in darkness He (the supreme) was alone without a second. He reflected I am one, I will become many." Will was conceived in divine mind and creation ensued. This being the doctrine of the Vedas, is also that of the Vedantas, the purport of which school is declared to be the same as that of the Vedas, their end (auts) or aim. The Vedanta is called also the Uttara-mimānsā—subsequent or supplementary investigation. There is also, however, a Purva-mimānsā, or prior school of investigation; the object of which is to teach the art of reasoning, with the express purpose of aiding the interpretation of the Vedas not only in the speculative but the practical portion. As far as concerns the former, it of course adopts the same monotheistic principles. The Patanjala school teaches also the being of a God, the Nyayika and Vaisheshika teach the existence of one Supreme Soul—the seat of knowledge and the maker of all things, and the Panranik or Eclectic school maintain the same doctrine. The Sankhya denies the existence of a Supreme Being, although it recognizes a two-fold distribution of the universe as matter and spirit. Of these six ancient schools of philosophy recognised among the Hindus, some are avowedly inconsistent with the religious doctrines of the brahmins; and others, though deemed perfectly orthodox, advance opinions not stated in the Vedas. The six schools are enumerated in the following order by Mr. Colebrooke:

The prior Mimānsā, founded by Jāimani.
The latter Mimānsā, or Vedanta, attribut-

MIMOSA.

ed to Vyasa.

The Nyaya, or logical school of Gôtama.

The Atomic School of Canāde.

The Atheistical School of Kapila.

The Theistical School of Patanjali.

The two last schools agree in many points and are included in the common name of Sankya.—*Wilson's Religious Practices and Opinions of the Hindus*, p. 44. *Elphinstone's History of India*, p. 215. See Brahman; Darsana; Hindoo; Nyaya; Vidya.

MIMARARI, HIND. of Ravi, and Chenab Rhamnus purpureus.

MIMBAR HIND. A mahowedan pulpit: also the minarets of a mosque.

MIMOSA, a genus of plants of the natural order Fabaceæ, or Leguminosæ, of which the following species occur in the South and East of Asia.

Asperata,	Mutabilis,	Rubiocalis,
Ilumata,	Padica,	Sensitiva,

The leaves of some of the species are remarkable for being sensitive to the touch. The pink and yellow flowers of one of the small shrubby kinds are particularly beautiful in the rains, they readily grow from seed in any soil. The Wattle-bark of commerce is procured from different species of mimosa, which grow in Australia and New Zealand. It is sometimes imported in the form of fluid extract, as well as bark. The leather produced by its means is of good quality, but of bad colour. The bark must be finely ground, or it does not give up the whole of its tannin to warm water. Many plants formerly placed by botanists in this genus have been referred to other genera.

Gtodasala,	SANS.	Sikai-akoo,	TEL.

This plant has a long, flat pod or legume, containing separate, small, oval, dark coloured seeds, and is considered by Native Practitioners a most valuable medicine. In taste it somewhat resembles the soap nut, but is more acid, less bitter, and has a singular pungency. Its qualities are said to be deobstruent, detergent and expectorant. It is commonly prescribed in cases of jaundice and other biliary derangements, and is, besides, used by them like the soap nut, for washing the head. The small leaves of this prickly shrub have a pleasant acidity, and are frequently put into pepper water, when it is found necessary to keep the

MIMUSOPS ELENGI.

bowels open or work off bile. The pod is usually prescribed in electuary, in doses of about the size of a small walnut, every morning for three days.—*Ainslie's Mat. Med. pp. 111 and 260.*

Mulsari ka phool,	HIND.	Maghadam poo,	TAM.
Bacnla,	SANS.	Poghala	„ TEL.
Bolsarika phool,	DUK.		

This ornamental flowering tree grows in Ceylon, throughout the peninsula and the north of India, in Burmah, Pegu, Tenasserim and the Moluccas. In the Bonibay forests, it is mostly found as a cultivated tree, more rarely wild and then only below the glants. It has dark evergreen oblong alternate leaves, and small pale brown or white sweet smelling fragrant flowers, of moderate size, from which an oil is distilled. Its flowers are celebrated in the Puranas and even placed amongst the flowers of the hindoo paradise. Krishna is said to have fascinated the milk-maids of Brindabun, on the banks of the Jumna, by playing on his flute beneath a bakula tree, the wood is strong, very hard and durable, for any ordinary purpose, serviceable for houses, but not used in ships or boats. The berries are eaten sometimes by the poor. Burmese ladies, value its small delicate sweet-scented blossoms, which they string in chaplets for the head. A cubic foot weighs lbs. 61 and it is estimated to last 50 years.—*Drs. Roxb. Wight, Gibson, J. L. Stewart, Mason, Voigt, Cal. Cat. Ez.* 1862, *Madr. Ex. Jur. Reports, Mr. R. Brown, Thewites, Ains. Cheerie	SANS.	Pala pundoo	TEL.

This large, handsome tree grows in the eastern provinces of Ceylon, in the Deccan, is generally planted by mahomedans; grows near the Godavery, is common in Guzerat, where it reaches a great size, but is seldom found in other of the Bombay forests. The wood is hard, fine grained, rather strong, and much used for sugar mill beams and well-frames in Guzerat, and where strength and toughness are required. A cubic foot weighs lbs. 60 and it is said to last 10 to 70 years. It is used for rulers, knobs, handles of tools, such as chisels, &c., and other articles of turnery; and, in Ceylon, for oil presses, bridges and buildings. The small berries are eaten when ripe, are nutritious and palatable. The dried fruit is also occasionally seen. *Drs. Roxb. Voigt. Mason, Ainslie, p. 229, Riddell, Irvine, and Gibson, M. E. J. R., Mr. Mendis, Captain Beddome.*

The root.

Khirni Lod'h. PANJ.

This middle sized tree grows in Malabar, in Northern India, the Panjab, the Malay islands, the Moluccas and New Holland. At Ajmeer and Kotah, the tree becomes very large and handsome. In the Dekhan, also, it grows to a large size, and is generally planted in groves. The wood is fine-grained and hard. The fruit, is about the size of a small olive, is of a yellow color when ripe, after the rains, and contains a sweet clammy juice, eaten chiefly by the natives. The flowers are aromatic and the seeds yield medicinal oil obtainable in tolerably large quantities in some parts of the country. In Burmah, this dried fruit is occasionally seen among the Chinese, brought from Singapore. In the Panjab, the powdered seed is applied in ophthalmia, and the root is officinal in Australia, its north-east coast is well wooded, chiefly with the Mimusops kanki, trees of which are, there, often 60 feet high and 3 in diameter.—*Voigt, Dr. Irvine's Med. Top. of Ajmeer, p. 190, Drs. Riddell, Mason and J. L. Stewart ; Macgillivray's Voyage, Vol. I. p. 106.*

MINA, a valley near Mecca.

MINA BAZAAR, an exhibition.

MINAGARA an ancient city on the Indus river, the chief site of the dominions of the Parthian kings of the Panjab. Its position has occupied the attention of geographers from D'Anville to Pottinger. Sindh being conquered by Omar, general of the (Abbasi) caliph Al-Mansoor the name of Minagara was changed to Mansoorah une ville celebre sur le rivage droit du Sind ou

MINAGARA.

Mehran, "Ptolemee fait aussi mention de cette ville; mais en la deplacant," &c., D'Anville places it about 26° , but not so high as Ulug Beg, whose tables make it $26^{\circ} 40'$. General Cunningham has little doubt that Minagara, handed down to us by the author of the Periplus, was the Saminagara of the yadu Jhareja, whose chronicles claim Sewisthan as their ancient possession, and in all probability was the strong-hold (nagara) of Sanibus, the opponent of Alexander. On every consideration, he is inclined to place it on the site of Sehwan. Vincent, in his translation of the Periplus, enters fully and with great judgment upon this point, citing every authority, Arrian, Ptolemy, Al-Biruni, Edrisi, D'Anville, and De la Rochette. He has a note (26 p. 336, Vol. I.) which is conclusive, could he have applied it. "Al-Birun [qui distant] between Deheil and Mansura. D'Anville also says: "de Mansora a la ville nommee Birni, la distance est indiquée de quinze parasanges dans Abulfeda," who fixes it, on the authority of Abu-Rohan (surnamed Al-Biruni from his birth-place), at $26^{\circ} 40'$. Gayni, or Gajni, is one of the ancient names of Cambay (the port of Balabhipoor,) the ruins of which are about three miles from the modern city. Other sources indicate that these princes held possessions in the southern continent of India, as well as in the Saurashtra peninsula. Filatipoor Putun, on the Godavery, is mentioned, which tradition asserts to be the city of Deogir; but which, after many year's research, General Cunningham discovered in Saurashtra, it being one of the ancient names of Kundala. In after times, when succeeding dynasties held the title of Bhalaca-raj though the capital was removed inland to Anhilwarra Putun, they still held possession of the western shore, and Cambay continued the chief port. These invaders were Scythic, and in all probability a colony from the Parthian kingdom, which was established in sovereignty on the Indus in the second century, having their capital at Saminagara, where the ancient Yada ruled for ages, the Minagara of Arrian, and the Mankir of the Arabian geographers. It was by this route, through the eastern portion of the valley of the Indus, that the various hordes of Geto or Jit, Hun, Camari, Catti, Macwahana, Balla and Aswaria, had peopled this peninsula, leaving traces still visible. The period is also remarkable, when these and other Scythic hordes were simultaneously abandoning higher Asia for the cold regions of Europe and the warm plains of Hindusthan. From the first to the sixth century of the Christian era, various

MINAHASSA.

records exist of these irruptions from the north. Gibbon, quoting De Guignes, mentions one in the second century, which fixed permanently in the Saurashtra peninsula; and the latter from original authorities, describes another of the Geto or Jit, styled by the Chinese Yu-chi, in the North of India. But the authority directly in point is that of Cosmas, surnamed Indopleustes, who was in India during the reign of Justinian, and that of the first monarch of the Chinese dynasty of Leam. Cosmas had visited Callian, in the Balhara kingdom; and he mentions the Abtelites, or White Hun, under their king Golas, as being established on the Indus at the very period of the invasion of Balabhipoor. General Cunningham identifies Minagara with modern Thatta—*Tod's Rajasthan* Vol. I. p. 217.

MINAH, also written Meena and Mina, one of the ancient races occupying India. Many of these ancient tribes are addicted to robbery, dacoity and thuggee. Amongst others may be named the Bedowreeh, a robber tribe, of the north west of India. The Beriah and Minah, robber tribes in Central India, the Mhang, a robber tribe in western India. The Wuddar, a robber tribe on the northern frontier of Canara. The Takinkar, a robber tribe in the Dekhan. The Parlihi, Bhowra a robber tribe of Khandesh and Berar. The Wusawch a robber tribe of Guzerat. The Bhar a robber tribe of the Bombay presidency. And the Gehar, a large class of child stealers in the valley of the Nerbuddah. See Meena.

MINAHASSA. Menado and Kama in the province of Minahassa lie directly opposite each other on the West and East sides of the North Eastern peninsula of the large and rich island of Celebes, and are open to foreign trade. Menado, the capital of Minahassa is situated on a large and beautiful bay on the west side of the northerly promontory of Celebes, in $1^{\circ} 30'$ N. Lat. and $124^{\circ} 56'$ East Long. Greenwich, according to the chronometers of the *barque* Sumatra, (Dec. 1843), according to Horsburgh in $124^{\circ} 52'$ East Long. and according to Norrie $125^{\circ} 0'$. Cacao, is cultivated in the high lands, but mostly on the coasts. The plantations of it are even now considerable, and this branch of industry only requires not to be impeded by any obstacles, in order to be still further extended. It forms a large ingredient in the trade, and furnishes many petty traders with their daily bread, not to speak of the land-owners for whom the cultivation of the cacao affords the only subsistence. The preparation of this product here differs from that in the West Indies: 1,200 to 2,000 piculs of

MINAHASSA.

125 pounds are yearly produced; the prices vary much, being from 50 to 75 florins.

The sulphur Lake Lienong is situated near the negory Lahendong. Half way between Sarongsong and Lahendong the sulphur is observed exuding from the ground, and on the left, are several sulphureous marshes. Everything here is barren and rude, and nature waste and inhospitable. From the height at the back of negory Lahendong, turning to the west you behold, on both sides of the Korey mountain, the sea in the distance,—on the right, Lakon exposing its full dimensions,—at your feet the negory Lahendong,—at your back lake Lienong about half a mile in circumference, formed by the mountains Tolanko, Liugkoan, Kasuratan,—and Tempusan, below you. The glittering of the waters of the lake beneath is exceedingly beautiful showing, from the volcanic action, different colours. On the sides and at your feet you see the sulphur and the hot-water boiling up from the ground, the last at a heat of 200° to 202° Fah. so that in two minutes an egg may be boiled in it. On the other side of the lake, the aspect of nature is of a more terrific character, the hot water runs from the walls and shore into the lake, but it is of a lower temperature than that on the other side. A boiling sulphur pool, thirty feet in diameter, first arrests attention. It has a temperature of 140° , Fah. while all around there is nothing but desolation and boiling water, this is the place where the count de Vidua lost his life in his zeal for exploration. Not listening to the advice of the natives around him, he fell into the boiling mud. It is remarkable that in the circumference of 30 or 40 feet different degrees of heat were found, 135° , 171° , 145° , and lower, 165° . The volcanic direction near this lake is east and west, and the earthquakes there are felt in the same direction. The lake, is 10 feet deep, has an outlet through the district Souder, and near the negory Tinji forms a most beautiful cascade. In the lake Lienong, six different kinds of fish are found, viz., cabos, getegole, sayo lumulontik, komo and the largest kind of eels, and also a number of wild ducks and other water fowl. At noon the thermometer was 75° Fah. According to Professor Bikmore gold is found in great quantities in Celebes. It occurs over all the northern peninsula from the Minahassa south to the isthmus of Palas. Tavernier also relates that Celebes or Macassar produced gold also, which is drawn out of the rivers, where it flows among the land.—*Tavernier's*

MINDANAO.

MINA-KAR. HIND. Enamelling on silver. Vitreous masses of colours for enamels are employed by the "minakar," an enameller on silver, &c. The colors used are principally green and blue, salts of iron and copper diffused through vitreous matter; a yellowish color also is produced by litharge. The manufacture, consists in taking a silver or metal vase, having the pattern of leaves or flowers worked on it in relief and filling the hollows with enamel in a melted state. The colors exhibited are blue, green and red. The art of making this material, is known at Lahore, Mooltan and other places.—*Powell Handbook.*

MINAK, MALAY. Oil. Minak changke, Clove oil. Minak jurak, Castor oil. Minak kalapa also Minak Nur. Coconut oil.

MINAR, PERS., a minaret of a mosque or other building. Char-minar, a building inside the town of Hyderabad. See Kutub Minar,

MINAN, MALAY, Frankincense.

MIN CHENNAY, TAM., Fish roe.

MINCOPI. The people occupying the Andaman islands. They are skilful in shooting fish, manage their canoes well, and are fond of singing and dancing. They take little pains to cultivate the soil and are ignorant of the art of working in metals. They make their canoes by hollowing out the trunks of trees by means of fire.—*Latham's Descriptive Ethnology.* See Minkopi.

MINDANAO, is in lat. $5^{\circ} 39'$ N., long. $125^{\circ} 18'$ E. The interior of this large island is said to be inhabited by many small tribes of Papuans, but those only who reside near the north east, where there are several Spanish settlements, are known to Europeans. The chief tribes of the north are called respectively Danaga, Tagabalo, Malano, and Manabo, but very little is known concerning them, except that, in common with the other mountain Papuans of Mindanao, they are comparatively inoffensive. The great islands of Mindanao, Palawan, and the Sulu Group of islets, forming the southern limits of the Philippine Archipelago, contain many nations and tribes speaking many languages of which little has been published. Mr. Crawford on the information given by Mr. Dalrymple, informs us that even in the little group of the Sulu islands, a great many different languages are spoken, and he gives a short specimen of 88

MINERAL SUBSTANCES.

words of one of those most current. Mindanao is the eastern base of the Philippine, and Palawass the western. This island is 275 miles long by 39. It was formerly subject to the Sulu. The southern chain of islands is, throughout, the great sea of piracy in the Indian Archipelago, and it has been proposed to term it Piratania, including under that name Mindanao, Solo, and the crowd of other islands extending from Mindanao, to the N. E., coast of Borneo and separating the Mindoro from the Solo sea.—*Earl's Archipelago. The British World in the East Ritchie, Vol. II., p. iii.* See India, Papua, Salibaboo islands, Serangani islands, Sulu Archipelago; Tonking.

MINDHAL, HIND. *Randia dumetorum.*

MINDORO, an island lying immediately adjacent to the S. W. Coast of Luzon, being separated only by a narrow strait. The Negrito race who are residing in the island are congregated in a mountainous district, called Bengan, where they live on friendly terms with the Mangnians or wild tribes of the brown race, by whom they are surrounded although very little intercourse subsists between them. The Mindoro sea is bounded on the S. W., side by the N. E. coast of Borneo. It is much resorted to by British sperm whalers who obtain entire cargoes there. Mindoro Strait is 27 to 33 miles wide. The Mangnians are a mild but illused people, they are so little advanced in civilization, that European visitors, who have not had opportunities of personal communication with the Bangano often leave the island, with the impression that they are only a more savage variety of the same race.—*Bickmore Crawford. Earl. Wallace.* See India, Luban. Papuans.

MINE a river in Burmah.

MINE-DE PLOMB NOIR, also Plomb-de Mine, also Potelot, Fr. Blacklead.

MINERAL SUBSTANCES, useful in the arts, and applicable for personal ornament as gems, are very numerous in South Eastern Asia. Colours, from the mineral kingdom, are procurable in Southern India from the following places:—

Alumina coloured with madder lake, prepared from the munjeeth or,

Rubia tinctoria,	...Chingleput.
Antwerp red,	...Ganjam.
Burnt sienna,	...Hills near Salem,
Bright yellow ochre	...Hills near Cuddapah.
Brown ochre,	...Chingleput.
Cologne brown	...Neilgherry Hills.
Cream coloured ochre,	...Hills near Salem.
Dark shade of grey ochre	...Nuttum Hills.
Dark umbrs,	...Neilgherry Hills.

MINERAL SUBSTANCES.

Deep yellow ochre (common in the bazars of Madras,	
Flesh coloured ochre,	...near Salem.
Indian red,	...Hills near Chingleput.
Iron sand,	...Bimlipatan.
Lavender coloured ochre,	...Bangalore.
Light red ochre (prepared from the yellow ochre)	...Nuttum Hill.
Orange ochre, (made from the yellow ochre by heat),	...near Cuddapah.
Pale yellow ochre,	...in Nuttum Hills.
Peroxide of manganese	...Mahratta Country.
Plumbago or black lead	...Vizianagrum Golcondah. Travancore.
Puce coloured ochre,	...Bangalore.
Purple ochre,	...Hills near Chingleput Ceylon.
Raw umber,	...Neilgherry Hills.
Raw sienna,	...near Salem.
Roman ochre,	...Chingleput.
Salmon coloured ochre,	...Salem.
Silvery white kaolin,	...Bimlipatan.
Ultramarine prepared from the lapis lazuli,	...from Bombay.
Venetian red,	...in the Bazars in Madras.
Warm stone coloured ochre,	...near Chingleput
White ochre or porcelain earth,	...Bangalore.

TRICHINOPOLY.

Varieties of gypsum—Ootatoor.	Pink and colored granites
Do. of shell marble.	Copper, iron or other metals.
Tourmaline.	
Anthracite and stone clay (black).	

CAMBAY; BED OF SEENA; GODAVERY; RAJAHMUNDRY; N. CIRCARS.

Flint.	Soapstone.
Bloodstone.	Dolomite or grey magnesian limestone.
Onyx.	White felspar.
Agate.	Precious do. cleavelandite.
Cornelian.	Antimony.
Calcedony.	Plumbago.
Cat's eye.	Iron and other metals.
Jasper.	
Opal.	
Plasma.	

BELLARY.

Iron ore a great many varieties.	Lithographic marbles.
Near Hualial.	Whetstones and slates.
Lead.	Fine gypsum at Kaladget
Zinc.	Marbles at Ghooty, Ryel
Antimony.	cheroo and Tarputree
Gold—near Dummul.	—fine white statuary
Soapstone.	marble — yellow, pale
Magnesite.	green, dark green, red
White granular limestone	pink, purple, brown
mountain range of hills.	black and grey.
Dolomite.	

MINERAL SUBSTANCES.

SALEM.

Venetian talc, (green)—Puckanudo.	Garnets.
Serpentine do.	Ruby; Sapphire; Emerald; Topaz.
Adularia and white felspar—Yerrapaddy.	Corundum and emery, 4 or 5 varieties.
Granites, pink and green.	Magnesite; Soapstone.
Hornstone or chert.	Chromate of iron; Magnetite iron ore.
Jasper.	
Octohedral iron ore.	

COIMBATORE.

Beryl or aqua marina with its matrix of cleavelandite; Kangayum.	Gold sand, 3 or 4 miles West of Dewalee near the top of the karkoor ghat.
Corundum—red, blue and yellowish green.	Rock crystal.
Garnets.	Emery, 2 or 3 kinds.
Sapphire, ruby and topaz, said to be found along with the corundum.	Copper.
	Soapstone.

Also, in many parts of India, Ceylon, Burmah, the Malay peninsula and the islands of the Archipelago,

Iron ores.	Sapphire.	Turquoise.
Copper ores.	Emerald.	Avanturine.
Tin ores.	Rock crystal.	Cairngoram.
Lead.	Amethyst.	Coral.
Antimony.	Calcedony.	Sulphur.
Gold ore.	Onyx.	Ochres.
Manganese.	Blood stone.	Earths.
Silver ore.	Cats eye.	Clays.
Plumbago.	Prase.	Kaolin.
Coal.	Platina.	Lim.
Limestones.	Cornelian.	Pumice.
Marbles.	Agate.	Gypsum.
Building stones.	Jacynth.	Plaster of Paris
Granites.	Pearl.	Mica.
Slates.	Mother of Pearl	Asbestos.
Fire-clay.	Amber.	Talc.
Millstones.	Diamond.	Selenite.
Corundum.	Topaz.	Petroleum.
Garnet.	Tourmaline.	Fullers Earth.
Ruby.	Lapis lazuli.	Red Earth.
Topaz.	Cinnamon stone	

Mineral samples of copper are known to occur in 17 or 18 different localities of Southern India, in the forms of green carbonate and grey and liver colored ores, but the metal has never been traced to good veins or nests. The green and liver colored oxides of copper are said to occur in Kurnool, Cuddapah and Nellore. The Copper Mountain, Bellary does not contain a trace of copper, though it is are rich Hamatitic Iron ores.

Mewar is rich in metals; Mysore has iron ore, and Corundum, in abundance.

Belachistan is rich in mineral productions, copper, lead, iron, antimony, sulphur, and alum, abound in various parts while common salt is too plentiful to be advantageous to vegetation. On the high road from Kelat to Kuch Gundava is a range of hills, from which red salt, is extracted. Sulphur and alum are to be had at the

MINERAL SPRINGS.

same place. Ferrier saw quantities of white and grey marble in the mountains to the westward of Nooshky, but it does not seem to be at all prized by the Beluch.

Chinese authors assert, that there are between four and five hundred mountains in the empire which produce copper, and that there are upwards of three thousand which produce iron. Gold and silver mines abound, but the policy of the Government discourages their being worked. The mines of the province of Kwei-chow supply all the mercury used for the manufacture of vermilion, and there are mines producing lead, tin, and calamine, scattered all over the country. Mining in general is discouraged by the emperor. Coal was used very early in China as fuel; it is mentioned by Du Halde as black stones dug out of the mountains, which stones burn when kindled, and are used by many persons in preference to wood, of which there is abundance. It is found in the north and in the south, and probably might be had in nearly every province in the empire. At Shang-hai, it has been used on board Government steamers; in this district it resembles cannel coal; it is to be had also at Canton. Le Comte assures us that there is not any country better supplied with coal than China, and he particularizes the provinces of Shan-se, Shen-se, and Chih-le. *Sirr's China and the Chinese*, Vol. I. p. 424-425.—*Madras Exhibition Juries' Reports*.

MINERAL ACIDS. The Indian method of preparing these is as yet imperfect and the manufacture is conducted on a small scale, only in such large cities as Lahore, Amritsar, &c., there is a factory also in Kashmir.

MINERAL OILS. See Oil.

MINERAL PITCH. See Asphalt.

MINERAL SPRINGS exist in many parts of the South and East of Asia. The succeeding list, has no pretension to being any thing more than a catalogue but includes, it is hoped, most of the mineral sources in India and its dependencies, of which accounts have been published. The names attached to the notices have been added; generally they are those of the discoverers, or rather describers; but in some instances of the analysers of the waters. Some springs, such as the Moughyr Seetakund, have been so long known, that it is uncertain who the original describers were. Capt. Sherwill gives information about the Rajmahal and Bheerbhoom springs, Mr. Edgeworth about those in Kulloo, Dr. Fleming the ones in the Salt Range, and Mr. A. Young those in Sind. Major Sand-

MINERAL SPRINGS.

ers gave valuable information and much has been obtained from the Maps in the Quarter Master General, the Surveyor General, the records of the Foreign Office and Medical Board Offices. Petroleum wells have been included in the list, as they are of some commercial value, although they perhaps cannot properly be called mineral springs, and their medicinal use, which is known to the Natives of India, is also now almost abandoned except in some cutaneous affections. The districts richest in mineral waters appear to be the Tenasserim Provinces, a district around Hazareebaugh stretching in almost every direction for about 130 miles, in many places literally teeming with hot springs, the upper part of the Jullunder Doab, or rather the hills beyond its Northern boundary, the Salt Range, and Northern and Western Sind; next is the Concan, and, though not to be compared with any of the foregoing, the peninsula of Guzerat. The deficiency of mineral sources in the Southern portion of the peninsula of India, and throughout the great central trap formation, is remarkable. The known springs are found at every elevation, from within high water mark to a height of 12,000 feet. More than half of those in the following Table are thermal springs. The most frequent of all appear to be the hot springs without any very strong mineral impregnation, which are so abundant in the Tenasserim Provinces, and in the Hazareebaugh districts, in some parts of the Himalaya, in the Concan, also in Sind, where, as in many other places, an impregnation with carbonate of lime is common. One or two such have been found in Rajpootana and the Deccan. The sulphurous springs, appear to be pretty equally diffused: several in Hazareebaugh, some in the Nerbudda, some in the Concan and Guzerat, some in Sind and the Salt Range, many at the base of the Himalaya, and in the upper part of the Jullunder Doab. Only one has been noticed in the Madras Presidency, (Chittoor is scarcely an exception to this,) and no true one in Tenasserim. The great majority of them are thermal. The Saline springs are chiefly found in Sind and in the higher portion of the Punjab; they usually contain common salt with some sulphate of soda and small quantities of other salts, when they are not simply brine. Traces of iodine are found near Kangra. Throughout Rajpootana and in some parts of the Punjab, the wells are abundantly impregnated with soda. Some of the springs in Kemaon contain mineral impregnations, but scarcely to an extent to be considered saline.

MINERAL SPRINGS.

Scarcely any strong saline ones are thermal. The few thermal salines are chiefly calcareous, and one or two silicious. There appears to be a general deficiency of Chalybeates, and there is no one district in which they have been found more frequently than another, unless the outer ranges of the Himalaya; the wells in the Neilgherries are said often to have a trace of iron. None of the Indian chalybeates are thermal, and none of those known, except that at the beautiful spot Nagcouda, appear to be strong ones; but it is difficult to suppose, especially with reference to there being no want of iron in India, that other sources of this description and of more powerful virtues will not be discovered. It is said that there are many undescribed chalybeates in the Himalayas. The Murree hills contain scarcely any, and it is to be hoped that the one at Chumba, may prove of value. It is much to be regretted that none of the agreeable acidulous carbonated waters, such as the Seltzers, commonly called Seltzer water, which are abundant in some parts of Germany, have been found in India, where they would be so grateful. Some of the thermal springs, as the Seetakund, at Monghyr, the water of which is highly prized and often carried on long voyages, are probably slightly carbonated, and observers talk of Indian springs effervescing, for instance the so-called chalybeate at Bangalore. When, however, it is considered, that almost all strongly carbonated springs in other parts of the world are found in the neighbourhood of extinct volcanoes, as in Auvergne, the Rhine Provinces, the Caucasus, or near active ones as at Ischia, they are scarcely to be looked for in India. Hot springs are not necessarily indices of volcanic action; they are most common at points of great displacement of strata, or at the junction of stratified and unstratified rocks. Though considering the Loonar lake volcanic, many observers could not discover scoria or lava, but it appears that Dr. Bradley in 1851 found both. See a paper by Dr. Buist in Trans. Bombay Geogr. Society. He collected a large list of thermal springs, and connects them with volcanic agency. By analogy, some might be expected to be found in Arracan, or in the Pegu and Tenasserim Provinces, the first being, and the other two being nearly, included in the belt of volcanic action that runs up the eastern side of the Bay of Bengal, terminating in Barren Island and the mud volcanoes. In the great majority of instances, they have only been regarded by the natives of the country as emanations of the deity, and as objects of worship. Where-

MINERAL SPRINGS.

ever there is a hot spring, there is pretty sure to be a temple, visited by pilgrims. Many have, however, been used medicinally. Some of those, which appear to be most resorted to, for their healing virtues, are the springs at Malacca, those at Sonah, near Delhi, where considerable buildings have been erected for the convenience of bathers, at Munnee Karn, and at the Lukkee Pass. All of them are thermal, and except Munnee Karn, are sulphuretted, and natives have undoubtedly faith in them in certain cases. Such springs might easily at a small expense be made more extensively useful to natives. Europeans can scarcely be said to have ever made a fair trial of any of the mineral springs of India. Mr. Ludlow in 1826, suggested that the wells at Sonah should be made use of for European soldiers. Dr. Murray attempted in 1843-44, to employ the sulphuretted and chalybeate springs in the valley below Landour for the benefit of the invalids at that sanatorium, but he never met with the support he deserved, and the situation of the springs at the bottom of a hot and confined though picturesque valley, was a very important obstacle to success. In 1846 they were found all but abandoned. That more attempts of the kind have not been made, that springs of as high virtue as those so prized in Europe, should have been neglected, must no doubt be a matter of surprise to people who have not visited India, or to foreigners, to whom of all but the poorer classes a visit to a bath is a yearly necessity, and to Germans, who publish annually some 30 new works on their watering-places, but not to those who are aware of the many practical difficulties to be contended with in this country. It is not, however, generally known in Europe, nor indeed in India, that mineral springs are so abundant in the East. Above 100 separate localities have been ascertained within the bounds of British India. There are hot springs in Ladak, Nepal, and Sikkim; at Uchebal in Cashmeer, and hot sulphur springs near Rajourie, in Goolab Sing's territory. The mere absence of strong ingredients in the water, as in the Tenasserim and many of the Hazareebaugh hot springs, would be no essential obstacle to success in their use, for some of the popular European baths, as Matlock, Wildbad, Pfeffers, and Bad Gastein, are very deficient in salts, yet are found efficacious in many affections, being chiefly used for bathing. But the absence, at most seasons of the year, of a bracing climate, at the generality of the thermal springs in India, diminishes the chance of their ever proving of utility to Europeans. Perhaps the

MINERAL SPRINGS.

climate of Hazareebaugh, which is 1,500 feet above the level of the sea, alone offers something of an exception to this remark. The mountain of Parisnath, in that district, 4,500 feet above the sea has a space on the ridge at its summit, far too limited for more than two or three bungalows, and there would be much difficulty in procuring a proper supply of drinking water for any number of people.

The sulphuretted spring at Chaunch is only twenty miles from the terminus, and about three miles off the Grand Trunk Road. It is prettily situated, not far from the Pachoto hills, and there is a colliery near. But there is a much more abundant and hotter one called Tanloie, on the banks of the Damooda, two or three miles off. Those at Bum Buklesir are about fifteen miles from Munghelpore, and the same distance from Sooree: they are further off the high road, but are more powerful and abundant. The hot spring at Lakarakunda is not far off, and there is said to be another near at Kisshun. The elevation of all them may be about 300 feet above the sea level. Of these places, Bum Buklesir, is particularly deserving of an early investigation, for no analysis of its waters has yet been made. There are four or five springs: the temperature at least of the hottest, which is 162°, exceeds that of the most popular springs of the kind, Aix la Chapelle, or Bagnères and Canterels in the Pyrenees. During the four cold weather months the climate is probably not inferior to that of any of those places in their short bath season. Indeed, but for the peculiar arrangements of society in India, depending on Europeans being birds of passage, and not colonists, but for the absence here of any season of general relaxation from business these wells might, if there be no local objection to them, have long ago been found of much utility to the inhabitants of Calcutta. But the facility of communication with England and of going to sea, enjoyed by Calcutta people, has led to indifference about the sanitary resources of the country, and to the neglect of Cherra Poonjee and Darjeeling, or rather to their never being fully appreciated, and to the abandonment of the only sanatorium they had on the sea-coast, Pooree; not that it was ever in very high favor. A few of the residents of Cuttack still go there, during the hot months, but we never hear of any one visiting it from Calcutta. In fact, sea bathing, or any other kind of bathing, except for purposes of ablution, is scarcely known in Bengal, and probably not much practised in any part of India. Coortallum, not very

MINERAL SPRINGS.

far from Cape Comorin, is a large place with several bungalows close into the hills. The well known cataracts are close at hand. The lowest cataract falls from a height of 200 feet. The average temperature of the water is 72° to 75° and invalids derive great benefit from bathing in it. The bathing place is under a shelving rock, affording the most delightful shower-bath possible. The climate is particularly enjoyable to Europeans in June, July and August. The scenery is splendid; there are in all three falls, the highest being 2,000 feet above the sea. Amherst, or Negrals, may be useful to the occupants of British Burmah. Sind abounds in mineral waters, but the situation of the province and its climate alike preclude the hope of their ever being extensively useful to Europeans, though they might be more employed for sepoys, and the people of the country. The thermal springs of the southern Concan do not appear to be powerful, and they have no advantage as to climate. At Ramandroog there is a small plateau 3,198 feet above the sea; climate cool, invigorating and healthful, 13° to 14° cooler than Bellary; the table land is 2,735 yards long by extreme breadth 996 yards. The climate must make the sulphur springs of Bhadrachellum useless for Europeans, even if in other respects they were promising. The higher portion of the Jullundur is a tract abounding in mineral wells of all descriptions, where the icy stream of the Parbatti, close to the boiling fountain of Munneekarn, which rises in a jet at an elevation of 5,587 feet, could furnish Russian baths, if they were desired, and where the immediate vicinity of a chalybeate is not to be forgotten: where some are reported to contain Iodine or Bromine (the asserted presence of less than $\frac{1}{2}$ of a grain of bromide of potash, with the merest trace of iodine, in 16 ounces of the water, was the making of the Saline of Krentznach), and where some must possess the advantage of an almost European climate. In this district also and on the banks of the Beas, is Bishit, at an elevation of 6,681 feet, with an ample thermal sulphuretted source. Gerard says, there are a few mineral springs impregnated with salt, iron and alum, that may possess medicinal virtues, and the famous wells of Zungsum, at the meeting of the Speetee and Parati rivers, 4 miles north of Sheelkhur, where inscriptions in the Tartar language on tablets of stone describe the particular virtues of each spring, are scarcely beyond the limits of Kunawur.

Bum Buklesir is a pretty and curious

MINERAL SPRINGS.

spot, easily accessible. It is healthy and not jungly, being situated in a well-cultivated country, with a little jungle to its south. It is one mile from the large town of Tantipara, on the banks of a small nullah, called the Buklesir. There are five or six hot springs, the whole group called Bum Buklesir. The hot wells that have been surrounded with masonry walls are immediately on the north or right bank of the nullah. There are numerous hot springs in the bed of the nullah only to be seen in the dry season, giving out the well-known smell of sulphuretted hydrogen, with which the air is tainted. Near the hot springs there are several cold ones, all flowing from a tough gneiss rock. The hot and cold springs are only separated by a few feet from each other. The body of water ejected from the hottest well is very considerable, being about 120 cubic feet per minute; it runs from innumerable small orifices in an accumulation of mud and dirt, the rock being nowhere visible within the masonry of the tank. In the hottest water 162° , a green shining conferva thrives. Another spring is 128° , and the coolest 83° . Some 3 or 400 feet from the bank of the river, among the dilapidated temples, there is a large pueka tank which is supplied by two springs, one hot and the other cold; so that at one end the water is warm, at the other cold, and in the centre tepid. The stream of the nullah is about 50 yards across, with a brisk current, and it retains its heat below the springs for a considerable distance; its temperature was 83° in the month of December, when the temperature of the air was in the shade 77° . The sand of the stream some little way from the spring, and at the depth of six inches, is intolerably hot to the hand. Extending for about 200 yards along the right bank of the stream, are 320 small brick and mortar Vihara or temples, built by various pilgrims, each containing a Priapus or emblem of Maha Deo. Only one temple has any pretension to architectural elegance. Numerous attendant brahmins, who are most importunate beggars, loiter about the temples, engaged in bathing in the hot stream, or watching the cremation of dead bodies, which operation is constantly being carried on. Tantipara is a fine substantial village, with most of its inhabitants engaged in preparing silk for the Calcutta market; there is an indigo factory besides a police choki and abkari station; a short way off is the large town of Dobrajpore, offering a good market for English piece goods, and producing a large supply of fish from its numerous tanks. Between it and Bum Buklesir, and in the town of Dobrajpore, large naked and

MINERAL SPRINGS.

picturesque masses of granite and gneiss protrude through the soil, occupying altogether about a mile square. The scene is a very curious one. In the opposite direction, but farther away, is Nagore, or Jy Nagur, a large town; the greater part of it has gone to decay, as is shown by its falling mosques, its half-filled and weed-choked masonry tanks, and its ruined buildings which almost approach to palaces in extent. The famous Nagore wall or entrenchment, extends in an irregular and broken figure round the town of Nagore, at a distance of about 4 miles; its length is about 32 miles. At Lakarakoonda, about 5 miles off, is a warm spring, temp. 85° . Near the feeble stream which carries away its waters is a curious cut stone Hindu temple, which is fast falling into ruin.

Panjab. The mineral springs of the Panjab are always situated either in the hills or in submontane districts; there are hot springs, saline and sulphurous waters, and petrifying streams, in limestone districts, are not uncommon. The Jawala Mukhi range is a portion of the outer parallel of the sub-Himalaya. It is composed of a sandstone of the later tertiary period. The springs are situated all within a distance of about 30 miles near the base of the hills, on their south westerly face, looking towards the Beas; all contain chloride of sodium common salt and iodine, stated by Mr. Marcadieu, to be in the form of iodide of potassium in considerable quantity. In proceeding by order of their respective positions, and taking for a starting point the limits of the Jawala Mukhi valley, naturally formed by an elbow of the Beas near Nadaun, the salt ioduretted springs are placed in the following order; 1st Kooperah; 2nd Jawala; (two springs); 3rd Jowala Mukhi; 4th Nageah, and 5th Kanga Bassa. All the water from the five springs, one at Kooperah, three at Jawala, one at Nageah and one at Kanga Bassa, after having undergone slight concentration by being exposed only for a few hours to the open air, is purchased by the bunnials at one anna per seer, or exchanged for the same value in attah, &c. The livelihood of the natives living in the vicinity of these springs is chiefly earned by this trade. They are convinced and tell all who question them that the water contains an efficacious principle which promotes the cure of the goitre. Nature offers this remedy ready formed, and in large proportions without the excess being injurious; and there is a chance of finding a sufficient quantity of the salt to render it profitable in a commercial point of view. While the Jawala Mukhi waters

MINERAL SPRINGS.

contain a large per-centage of iodine, Dr. Fleming states as the result of his analysis that not a trace of it can be found in the rock salt of Mandi. The sulphuretted hydrogen spring at Danera, is considered sacred by the natives, who resort to it for cure in goitre and other diseases; it is situated about a quarter of a mile off the main road to Danera. The spring is not a thermal one, but its exact temperature has not been observed. A small way-side spring in the hills, near Dalhousie, has a strong chalybeate taste, and deposits the reddish precipitate indicative of iron. The temperature of Bishasht spring is 102° Fahr. that of the principal spring at Manikarn 202° Fahr.

The springs of mineral waters which occur in China, are generally thermal, or solfataras, yielding sulphurous gases, steam and warm-water, and their warm character gives them their Chinese names Wan-ts'uen, Wan-t'ang and Fuh-ts'uen. The hot sulphur mines of Tung-t'ang are about 50 miles from Chefoo. They resemble those of Atami in Japan, and are useful in skin diseases and the contractions and pains of rheumatism and other diseases. Twenty miles N. N. W. from Macao is the island of Hwangshan, in which the hot springs Yungmah occur, with a temperature of 170° . The waters contain salt, sulphate of Soda, Chloride of Calcium, and are useful in skin diseases. In the gypsum districts of the division of Yung-ching in Hu-peh, are several warm medicinal springs, resorted to by the sick. Large quantity of salt and fibrous gypsum come from these places in Ying-ching. Hwang-shan, a hill to the west of Hwui-chau-fu, city, in Ngan-hwui, has cinnabar springs which are reddened at times and are hot enough to make tea. A clear, hot, spring Yuh-shih-ts'uen, is met with at Li-shan, near Si-ngan-fu (Shen-si). At the Lu-Shan, near Kiu-Kiang (Kiang-si) are warm springs, once much vaunted for their efficacy, in syphilitic, leprosy and exanthematic disorders. At Li-en, in Shen-si is a carbonated spring called Li-ts'uen or Kam-ts'uen, whose sweet waters were deemed to encourage vegetation and to prolong life, and to be cooling, stomachic and corrective. To the S. E. of the city of Hoh-king-chau, in Li-kiang-fu (Yunnan) are warm mineral springs, esteemed in the treatment of abdominal tumours. There is the celebrated well of A-yih, at a place about 60 li to the N. E. of the district city of Yang-ku in Kwan-chau-fu, (Shan-tung), anciently called O-yih or A-yih. The well is seventy Chinese feet deep and its waters have a gela-

MINERAL SPRINGS.

tinuous principle like the waters of Bareges in France. The water is evaporated and produces a gelatine called O'Kiau or Asses-glue.

In Formosa, at its Northern end, 1750 feet above the sea, are sulphur pits, in the rocky gorge of a mountain, and eighty-five miles East of Tamsui, and clouds of steam and sulphureous vapour issue from rents in the rocks. There are several hot springs and pools, and a miniature Geyser throws intermitting jets of boiling water to a height of fifty or sixty feet. Another solfatara is near the village of Kim-pao-li some seven or eight miles to the N. W. of Kelung. In Japan similar solfataras occur, in the department of Satsuma, in the island of Kin-siu. The ground is volcanic and impregnated with sulphur. At the southern end of Satsuma is the burning sulphur island of Iwo-sima.

1. Sulphuretted Mineral Springs.

Malacca, thermal.—*Ward*.
Spring, 27 miles N. from Hazaroebagh, thermal.—*H. H. Wilson*.
Bum Buklosir, thermal, 16 miles, W. and S. of Sooree in Bhoerbhoom.—*Sherwill*.
Jorya Booree, not far from Chaunch, near meeting of Barakur and Damooda rivers, thermal.—*Oldham*.
Tantloie near it, on other side Damooda, thermal.
Bata Pani, Sirgoojah, Chota Nagpore, thermal.—*Breton*.
2 springs at N base of Maha Deo Mountains, Norbudda, thermal.—*Spilsbury*.
Well at Gwalior.—*Col. Tod*.
Below Landour.—*Murray*.
At Sonah, 30 miles from Delhi, thermal.—*Ludlow*.
At Lonsah, in Noorpore.—*Marcadieu*.
At Bishisht, in Kulloo, thermal.—*Gerard*.
In the Bukh Ravine Salt Range, thermal.—*Fleming*.
At Jubba in Salt Range, 10 miles E. of Indus. do.
Chilalee Pass W. of Indus below Kalibag.—do.
Mittah near Esau Khail W. Bank of Indus.—do.
Peer Mangul and Gazeo Peer in Sind, thermal.—*Major Baker and Lt. McLagan*.
At Lukkee Pass, near Schewan, thermal.—*Gibson*.
Within high water mark in Kuttywar.—*Sandwith*.
Temple of Sonmatli in Guzerat.—*Col. Tod*.
Arowlee in the Concan, thermal.—*Duncan*.
At Bhadrachellum on the Godavery, thermal.—*Heyns: Malcomson*.
At Chittoor, slightly thermal.—*Hardy*.

2. Saline.

Several springs at Soorojkoond near Belonpoo and Burkutta, Grand Trunk Road.—*Sherwill and Hooker*, thermal.
Tovah in Kangara district.—*Marcadieu*.
Mukhdor Rusheed in Multan.—*Edgeworth*.
Shahpore near Jhung.—*Neelmadub Mookerjee*.
Lahard Khad on Sutledge above Roopur.—*Wade*.
Universal throughout Salt Range.—*Fleming*.

Below Landour.—*Murray*.
On Rungeet river, Darjeeling.—*Liston*.
Runguoo river, 4 miles E. by N. of Darjeeling.—*Wiltscombe*.
Bangalore.—*Garrard*.
Ramandroog hills near Bellary.—*Mayer*.
Near old town of Attaran, Monlmein; thermal?
4. Thermal springs with no important ingredients, or imperfectly known, some of them probably carbonated.

Hot springs at Cannea in Ceylon, Temp. Variable?
Hot water fountain at Tavoy, }
Ditto at Lunkeyn in ditto, } *Prinsep*.
Ditto at Sienlee in Martaban.
Near Kaline Anrig Martaban.—*Low*.
Hot spring on Attaran river Tenasserim.—*Piddington*.
Hot springs on the Palouk river and at Pee, between Mergui and Tavoy, some sulphuretted.—*Major W. McLeod*.
Springs at Numyan near Prome.
Between Meenday and the Arracan hills.—*Phayre*.
Seetacoond, near Chittagong.
Utteer, 30 miles from Poore.—*Brander*.
Kaljhurnee, Maharoo, Hatbulleah, Noubhil, between Rajamahall and Soore.—*Sherwill*.

MINERAL SPRINGS.

Lacarakoonda 21 miles S. W. of Sooree in Beerboom.—*Sherwill.*

Tantloose 16 miles N. W. of Sooree, on Sidh Nul-la.—*Sherwill.*

Springs at Katkamsandi, old Benares Road. Everest. Pinarkoon, Ramgur.—*Bretan.*

Seetacoond, Monghyr.

Paharpore, Kurruckpore hills.—*Sherwill.*

Rajgeer and Guriuk, N. by E. of Gyah.—*Sherwill.*

On Rungeet river.—*Darjeeling Guide.*

Near Bagin river in Panna district, Bundelcund.—*Franklin.*

Two hot springs in Alwar country, one 15 miles W. by S from Alwar, one 20 miles N. E. of Jeypore.—*Capt. Bellow's survey.*

Mineral springs at Machery?—*Col. Todd.*

At Seetabaree, in Harowtee, also cold springs.—*Col. Todd.*

At Jumnottrie, Gungootrie, Kedernath, and at Badrinath, in Ghurwal.

Hot springs near Nutpa, Booktee and Jaurce, valley of Sutledge.—*Gerrard.*

Opposite Sonee banks of ditto.—*Prinsep.*

Hot spring at Silol, Kangra.—*G. T. Survey.*

Munneekarn in Kulloo and hot spring further up the Parbutti. Mr. Edgeworth informs that the water where it issues from its source, is of the temperature of 207° Fahr. It is, therefore, one of the hottest known springs. Some of the hottest of these are the Geysers 180°, Soorojkoond 190°, the Petersquelle in the Caucasus 195°, spring on Palook river 196°, and what Humboldt discovered and describes as the hottest spring in the world, Guanaxuata in Mexico 207°. The boiling point of water at the elevation of Munneekarn is much below that point. Rice is cooked in the spring at Jumnottrie 194°, at about 11,000 feet above the sea, and in many others of inferior temperature.

Kulat in Kulloo.—*Gerrard.*

Dower range of Soohman mountains.—*Fleming.*

Peer Muggen, Alligator Tank, 13 miles from Kurrahee.—*Carless.*

Juggen and Deyrah, N. Scinde.—*Kirk.*

Springs at the base of the Halla Mountains Scinde.—*A. Young.*

Onee, Central range of Kattywar, variable temp.—*Gibson.*

Oonopdeen and Soonopdeen in Satpoora Range.—*Briggs.*

From near Surat to Rajapore many hot springs, at Mallar, Rutnaghery, Mat, &c, more than 12 in number.—*Duncan.*

At Kair and Urjunnah, Deccan.—*Malcomson.*

At Byorah.—*Malcomson.*

5. Petroleum.

Pegu?

Arracan, Paidong 5 miles from Ramree.—*Bogle.*

Island of Cheduba.

Assam at Jeypore and five other places.—*Hannay.*

Sylhet.—*Inglis.*

Kaffir Koto, Aigud ravine, W. bank of Indus.—*Fleming.*

Jubba, N. side of Salt Range, 10 miles E. of the Indus.—*Fleming.*

Jowali Mookhi.—*Gerrard.*

Three springs in Dooloo, eastward of Gogra.—*Gerrard.*

A Mineral spring occurs in the Sangur talook Nugger division of Mysore.—*Dr. H. R. Oswald, M.D. Cat. M. E. of 1857.*

At Darjeeling there is a Mineral water in the Minchu spring. The water is a carbonated and sul-

MINERY, an artificial lake in Ceylon, 20 miles in circumference. A charming sylvan spot.

MINGULA-THOOT.

MINERVA. See Hindoo; Osiris; Saraswati.

MINGAL, a tribe of rude and predatory habits, who occupy the southern hills of Jhalawan from Khozdar to Bela in Las. They have two great divisions, the Shahi-zye and Phailwan-zye. The Bizunja, of which are two great divisions the Amalari and Tanbarari, are west but on the same hills as the Minghal. They are a violent people and much addicted to rapine. The Zigger Mingal emigrated to Nuskhee. The Sunari a branch of the Zehri tribe of Jhalawan inhabit Dasht Guran near Kelat. The Zigger Mingal and Raskshani, who inhabit Nushki, have no proper towns or villages, but reside in tents, and are not migratory. Their river the Kaiser, is useless for irrigation, and is lost amongst the sands. They cultivate wheat at the skirt of the hill ranges supporting the plateau of Saharawan. Snow seldom falls. The Zigger Minghal at one time occupied the Dasht-i-Guran near Kelat, but their increasing numbers compelled them to migrate into Nushki, dispossessing the Rakshani, of whom two toman or clans still reside at Nushki. They have a good breed of horses, called Tarji. Their flocks are very numerous. Saharawan and Las are on a great mountain range or table land that runs N. and S. Jhalawan with less elevation than Saharawan, is held by Brahni tribes, amongst whom are the Minghal, Bizunja and Samalari, in the hills. The fixed population in their little towns, does not exceed 10,000 and are greatly exceeded by the pastoral tribes,—the great tribes of Minghal and Bizunji, giving them the preponderance. Jhalawan and Saharawan are the two great central districts of Beluchistan, and these districts surround the districts of Kelat which depend on the capital. The plain of Dasht Guran, south of Chappar, is inhabited by the Sunari, a branch of the Zehri tribe of Jhalawan. Many of the Jhalawan tribes are undoubtedly of Rajpoot origin; and until lately, the practice of infanticide was prevalent amongst them. Near Bagwana is a cave in a rock filled with the dried mummy like bodies of infants, some of which had a comparatively recent appearance. See Kelat; India.

MING-MON. See Talieng or Mon.

MINGTI. See India.

MINGULA-THOOT. BURM. This is supposed to be the Mangula Sutra, meaning the auspicious or fortunate discourse. It is a sermon of Gautama, containing thirty-eight rules of life or a summary of beatitude. It is one of the first lessons taught to a Burmese youth.—*Yule. p. 96.*

MINJHAREE.

MINIAK. MALAY. Oil.
MINIAK-IKAN. MALAY. Fish oil of Singapore.

Red oxide of lead,	"	Minio,	IT.

Red-lead, is a red coloured tri-plumbic oxide of lead. Massicot and Minium may be produced at pleasure, by continuing the calcination of the metals first into litharge or Massicot, the monoxide, and then into the red tri-plumbic tetr-oxide. It is prepared by hindoo chemists. It is used for purifying concentrated acetic acid also to adulterate, or in lieu of, vermilion and by glass makers and painters. The hindooes smear it largely on their idols, or on stones to convert them into a deity.—*Smith. Royle See Lead, Red Lead.*

MINJAMGAN or Horten Island, on the East Coast of Java, is about 5 miles west of the entrance of Bally Strait.—*Horsburgh.*

MINJHAREE or Paloodhona. URIA. A tree abundant in Ganjam and Gumsur, extreme height 45 feet, circumference 5 feet and height from ground to the intersection of the first branch, 6 feet. Used on account of its lightness for rafts also for picottah poles. The fruit and flower are both eaten. The bark and leaves are used medicinally for worms.—*Captain Macdonald.*

Frauen murze,	GER	Widda,	TAM.
Podius; Nana; Guz. HIND.			

Dried Mint is more commonly used by Europeans than natives, but is esteemed as a medicine by the latter. Dogs refuse to sleep on rugs beneath which mint has been placed, and this simple plant thus affords a good means of ensuring cleanliness. Mint is occasionally prescribed by mahomedan practitioners in dyspeptic complaints, and to stop vomiting. Several kinds are distinguished, all remarkable for their peculiar odour and taste. The common sorts are three, spear-mint, pepper-mint and penny royal, also *Mentha hirsuta*; *M. crispa* and *M. canadensis*. The first is generally used for culinary purposes: it may be propagated by layers, or cuttings, or parting of the roots; it requires a moderate proportion of water. In the rains a small black caterpillar attacks the leaves, and will destroy the whole bed if not removed by hand or by flooding the beds, when the insect becomes detached from the leaves, and is easily destroyed. The mints are domestic medicines, carminative, antispasmodic; stomachic, astringent, sudorific and alexipharmic.—*Riddell. Foulkner. Powell, Hand-Book. V. 1. p. 301. Smith p. 150.*

MINTRA. A tribe in the Malay peninsula with numerous superstitions, but believing in another world. The Mintra are not so advanced in cultivation and arts as the Crean of the Tenasserim Coast, these

MIRABAN.

last cultivate cotton, and make their own cloth, which is not the case with the Mintra. The Crean have also many vegetables which are unknown to this tribe. The Mintra clear a small piece of ground in March, in July they set fire to the trees which are then sufficiently dried, and at the beginning of September they plant paddy, cludy, &c., their Ladang is so small that their harvest of rice is enough only for a couple of months, the cludy being then their only food for the remainder of the year. The Mintra are very partial to the flesh of monkeys, and if the use of it was not prohibited by the Koran, there is no doubt that the generality of them would have been converted to Islamism. To procure it they use the sampitan, which is a bamboo from 6 to 8 feet long, the arrows are slips of bamboo 10 inches long, with a piece of light wood at the bottom, shaped to the bore of the tube, which they propel by blowing hard. The point of the arrow being anointed with a prepared poison called tipob, communicates it to the blood and after two or three minutes the animal vomits and falls dead. Should the arrow penetrate the skin of large animals, many of them die, but they are generally lost to the sportsman, as they are able to run, after having been wounded, to a great distance. These savages seldom miss their aim but will shoot with their arrows monkeys seated on trees of seventy or eighty feet high, one wounded animal, after jumping on some other branches, and throwing away what he was eating, immediately after fell down.—*Jour. Ind. Arch. Vol. V. No. 8, August 1851.*

MIR. PERS. HIND. A chief, a president of an assembly, a title of any Syed as Mir Akbar Ali, Mir Kasim, Mir Mohib Ali.

MIRA BAI, the founder of a hindu sect of vaishnavn, who lived in the time of Akbar. She was the daughter of the petty raja of Merta and was married to the rana of Udi-pur. She is fabled to have been worshipping at Dwarka when the image of Krishna opened and she leapt into the opening. She is one of the Sad'hwia or female saints of the vaishnava.

MIRABAU. A Penang wood of a light red colour. Much used for ship building, furniture, &c.

MIRAFRA.

Cultivated as an ornament in most gardens, root considered as an aperient by the native doctors, &c. but Drs. Hunter and Shoolbred tried it without satisfactory results, and Dr. O'Shaughnessy's experiments lead him to believe it destitute of any efficacy. It is at best an uncertain cathartic though the roots were long regarded as the source of the true jalap, their taste is acrid and nauseous, and they abound in starch; the seeds also contain this principle in such abundance that they have been proposed as an alimentary article. The *Mirabilis dichotoma* and *longiflora* are reputed to possess similar properties. The Marvel of Peru has flowers of various colours, red, white and yellow, also variegated red and white, yellow and white. The root when dried is prepared for medicinal use. It becomes in a short time quite a weed in a garden. Is propagated by seed and in any soil.—*O'Shaughnessy, p. 511. Riddell. Birdwood, Mason, Powell.*

MIRAFRA. Confining this genus of birds to the species devoid of narial tufts, Mr. Blyth distinguishes *Spizalunda*, *Blyth*, ex. M. Hayi, *Jerdon*, which is a peculiar and rather thick billed and true lark, as shown by the form of the wing, &c., and *Annomanes Cabanis*, ex. M. *Phenicura*, *Franklin*, Al. *Lusitania*, *Gmelin*, (v. *deserta*, *Licht.*, *isabellina* *Tem.*, et. M. *phanicuroides*, *Blyth*), and probably M. *cordufanica*, *Strickland*, to which he suspects that A. *cinnamomea*, *Bonap.*, should be referred. The prior establishment of the genus *Annomanes*, is known and A. *cinnamomea* (*cordufanica*?) is correctly referred to it, also the *Alauda pallida*, *Ehrenberg*, with possibly *Budytes viridis* (*Motacilla viridis*, *Scopoli*), founded on the bad figure in Brown's Ill. Orn. pl. 33. f. 2, M. *histrigata*, *Raffles*: B. *melanocephala*, et B. *becma*, *Sykes*; B. *neglecta*, *melanocephala*, et *flava*, apud *Jerdon*, *Catal*; M. *melanocephala*, *Lichtenstein*; B. *flava* vel *neglecta* et B. *Rayi* vel *flaveola* of India and the Malay countries *auctorum*.—*P. Z. S. Nov. 26th 1850. Rev. Zool., &c., 1851 p. 178. Mr. Blyth's Report.*

MIRAGE.

Bahr-ul-milh, or salt-sea.	Ar.	Chitram.	Hind.
Bahr-bila-ma or		Namāish-i	Ab
waterloss sea	"	Ser-ab	PER.
Si-kot.	Hind.		"

It is said that beasts are never deceived by the mirage. But, to man, the distress occasioned in Arabia by a deficiency of water is frequently increased by the tantalizing appearance presented by the mirage in that country. The light refracted in the rarefied air immediately above the heated ground gives rise to the resemblance of an extensive lake, and the thirsty traveller, advancing towards it finds the flattering delusion recede before him. In the early part of the morning, while some dew remains on the ground, the perception is remarkably strong; every object is then also magnified, so that shrubs appear as trees, and under them frequently appear their images inverted, as if reflected from the surface of water.

In the desert of Dhat and Oomra-Soomra, where the shepherds pasture flocks, and especially where the alkaline plant is produced, the stratification is very horizontal, and produces much of the mirage. It is this illusion to which the inspired writer refers, when he says, "the mock pool of the desert shall become real water." The inhabitants of the desert term it Chitram, literally, the picture, by no means an unhappy designation. This optical deception is well known to the Rajpoots, is called "seu-kot" or 'winter castles,' because chiefly visible in the cold season; hence, possibly originated the equally illusory and delightful 'Chateau on Espagne,' so well known in Europe.

It is to be seen in every part of British India just as Eothen describes the likeness of a fresh water lake, like a broad sheet of calm water, that stretches far towards the south—stretching deep into winding creeks, and hemmed in by jutting promontories, and shelving smooth off towards the shallow side; on its bosom the reflected fire of the sun lay playing, and seeming to float upon waters deep, and still.

Though, says he, I knew of the cheat, it was not till the spongy foot of my camel had almost trodden in the seeming waters, that I could undeceive my eyes, for the shore line was quite true, and natural. I soon saw the cause of the phantasm. A sheet of water, heavily impregnated with salts, had filled this great hollow; and when dried up by evaporation had left a white saline deposit, that exactly marked the space which the waters had covered, and thus sketched a true shore-line. The minute crystals of the salt sparkled in the sun, and so looked like

MIRI.

the face of a lake that is calm, and smooth. —*Eothen's Travel from the East*. p. 271. *Burton's pilgrimage to Meccah* Vol. iii. p. 23. *Tut's Rajasthan* Vol. I. p. 18. Col. *Cheesey*. *Euphrates and Tigris*. Vol. I p. 572.

MIRAJ AR., the heavenly journey related by Mahomed.

MIR AKOR PERS. Master of the Horse: Chief groom of the Stables.

MIRALIA. See Hydridæ.

MYÆ ZU BURM. Mimbalis alba.

MIRANDU, HIND. of Kangra, Dodonæa burmanniana.

MIRAPA KANDRA. Or Varngoki. *Toddalia aculeata*. PERS. *Scopolia* Ac. R. i. 616.

MIRAPA KAYA, *Capsicum frutescens* L.

MIRA SALICIFOLIA, is the Maire or Sandalwood timber-tree of New Zealand.

MIRASI, ARAB. HIND. Having ancestral rights. In Sind, the mirasi is a bard, who accompanied his chief to the field and sang the Shair or war song during the combat.

MIRAT. See Lat.

MIRBOW. See Semang.

MIR CASSIM, succeeded Mir Jaffir as subadar of Bengal. After a varied intercourse with the British, he was defeated by them at Cutwa, on the 19th July 1763, and again at Gherea on the 20th August and in November he fled to the Court of the vizier of Oudh.

MIRCH, DUK. HIND. SANS. any Pepper, Chillies; Gol-mirch, Black pepper, *Piper nigrum*. Lal-mirch, capsicum or red-pepper. *Capsicum annum*. Kaughol mirch, is *Cellis caucasicus*.

MIRCHA, also Mirchai. SANS. *Capsicum frutescens*.

MIRCHAI, HIND. See Kuladana,

MIRCHI. GUZ. HIND. *Capsicum frutescens*, Chillies.

MIRCHIA GAND, HIND. *Cymbopogon iwaruncusa*.

MIRCH-SOOKH. HIND. *Capsicum annum*.

MIR-DAH. PERS. literally a master of ten, the Chief of peons, also a land measurer, who must measure with a standard yard, or guz, with the seal of the principal town of the district affixed to it. The Illahce guz, as fixed by Akbar is the one used. (Vide Aycen Akbery, 4to Ed. Vol. I. p. 354) —*Malcolm's Central India* Vol. II. p. 30.

MIRGH, PSHU. A leopard.

MIRI, a hill tribe on the Eastern frontier of the Abor area. They all wear some woollen article of dress. They use the bow and poisoned arrow. The Miri are allied to the Abor, Dofla or Aka, rather than to the Mishmi. The Miri have their chief seat in the low hills north of Banskotta and Lukim-

MIR JUMLA.

pur, but the exactions and cruel ravages of their formidable neighbours the Abor, have compelled them to migrate in large numbers into the plains of Upper Assam. Mr. Robinson remarks that a partial comparison of the dialects spoken by these tribes furnishes abundant evidence of their original consanguinity, while the coincidence between their vocables and the terms in common use by the Tibetan tribes, is frequent and unequivocal. The Miri race occupy the north banks of the Brahmaputra in Lat. $27^{\circ} 50' \text{ N.}$ and Long $94^{\circ} 50' \text{ E.}$ in the western part of the valley of Assam, they are to the S. W. of the Abor.

The Bibor, Jubar and Kulta or Kolita, are populations to the north and east of the Abor and Mishmi localities, on the drainage of the Brahmaputra. In the end of 1861 the Meyong Abor attacked and plundered a village in the British territory, but the tribe expressed a desire to renew friendly relations, and begged that their offences might be overlooked. On the 5th November 1862, an agreement was made with them binding them to respect British territory, and the same engagement was subscribed on the 16th January 1863 by the Kelong Abor. On the 8th November 1862, a similar engagement was concluded with the Abor of the Dihong-Dihang duar. The Abor Miri language belongs to the old Assam alliance, but it has been greatly modified by Tibetan. It has a strong ideologic resemblance to the Dhimal, Bodo, Garo and Naga, but with some specific Tibetan traits.—*Journal of the Indian Archipelago*, Nos. iv and v April and May 1853. p. 190; *Treaties, Engagements and Summits*, Vol. vii, p. 343; *Indian Annals*; *Latham's Descriptive Ethnology* Campbell, p. 54. See India; Singpo.

MIRIALU, TEL. Black Pepper.

MIRIAL TIGA, TEL. Piper tricoecum.

MIR JAFFIR, in 1702, was appointed dewan of Bengal and viceroy of the three subahs, Bengal, Behar and Orissa. He was of a poor brahmin family, of the Deccan, but was purchased by a Persian merchant and converted to mahomedanism. He rose to distinction under Aurangzeb who styled him Murshid Kuli Khan, and Murshedabad was called after him. He remodelled the revenue system of Toder Mull. He was a great and an energetic ruler and died in 1725.

MIR JAFFIR KHAN, after Suraj ud Dowlah's death, succeeded to the supremacy in Bengal in 1757.

MIR JUMLA a native of Persia, a servant of the Kutub Shahi king of Golcondah, afterwards a general of Aurungzeb; he died at Dacca about 1662.

MIRPUR.

MIR-KHOND, the historian, names himself Muhammed-bin-Khavand Shah-bin Mahmud. His celebrated book is styled *Rauzat us Safa* or *Garden of Purity*. He was born in 1432, flourished at the court of Husein Mirza at Herat, and wrote a general history of Persia, from the creation to the year 1471, which he entitled *Rauzat-us-Safa*. After many years of disappointment from want of patronage, he was at length befriended by the munificent minister Ali Shir Beg, who obtained him a suitable dwelling near Herat, and assisted him in collecting materials. Mir-Khond died in 1498, and his son, Khondemir, wrote an abridgment of his father's work, which he called *Khalasat-al-Akhbar*. Teixeira, a Portuguese traveller, published a translated abstract of Mir-Khond, and there is an English translation of Teixeira, by Stephens; but the best translation of that portion of Mir-Khond's work, which relates to the history of Timur's conquests, was published in Major David Price's *Mohammedan history*, in 1821. There is also a translation of Mir-Khond's history of the early kings of Iran, published by David Shea in 1832. His book is divided into a Preface, seven Parts or Sections, and a conclusion. Each part makes a very thick volume in folio. He wrote it at Herat in a caravansera called *canchalalo-culasya*, built by the vizier Mir Ali Shir, to whom he dedicated this work, which he intitled *Rauzat-us-safa fi sirat al-anbia, o ul muluc, o ul kulafu*; which signifies, *The Garden of Pleasure, touching the Lives of the Prophets, King's and Khalifs*. The Preface treats of the Science, or Art of Chronological History: *History of Genhizean* p. 429.—*Onseley's Travels* Vol. II. p. 392.f *Markham's Embassy* p. xxxiii. See Kondemir.

MIR MAHOMED MASUM, author of *Tarikh-us-Sind*, a history of the conquest of Sind by the Arabs, and down to the time of Akbar. He took the takhlilus of Nami. He was born at Bhakkar in Sind and wrote A. D. 1600. *Elliot's Hist. of India*.

MIRMALENZI, PERS. PUSHT, a water melon of Candahar.

MIRDA—? A migratory shepherd race in the South of India.—*Wilson's Gloss*.

MIRZA, PERS. An honorary title, from two Persian words *amir-zadah*, nobly born; when prefixed to a name as *Mirza Abdul Baki khan*, it means a secretary, a moonshi, when suffixed as *Abbas Mirza*, it means prince Abbas.

MIRPUR, Eastward of Hyderabad in Sind, is Mirpur, the strong-hold of a former chieftain of the Tulpur house: still further towards the desert, was Omerkot, noted as

MIRZAPUR.

the birth place of the illustrious Akbar: this was long looked upon as the depository of the accumulated wealth of the Kalora and Talpur rulers, and the point in which the chiefs would make a stand in case of an invasion of their country.

MIRREY MANGI-KAI, TAM. *Spoudias dulcis*.

MIRRHE, DUT. Myrrh.

MIRRI, HIND. *Pinus gerardiana*.

MIR TAHIR MAHOMED, NASYANI, son of Syed Hasan of Tatta, is the author of the historical work *Tarikh-i-Tahiri*. He left Candahar when it was belengured by the Persians for Tatta A. D., 1606. A. H., 1015, and he wrote his book A. D., 1621. *Elliot's Hist of India*.

MIRU one of the most delightful villages of Kunawar, being rivalled only by Rogi and Chini, beyond which the climate becomes too arid for beauty. The crops at Miru, both of grain and fruit, are most luxuriant, and the vine thrives to perfection. The scenery around Miru is indescribably beautiful, as it almost overhangs the Sutlej 3,000 feet below, while beyond the river the mountain-slopes are densely wooded, yet often rocky and with every variation of form. A single peak, still streaked with snow, but too steep for much to lie, rises almost due opposite, behind which the summits of the chain south of the Sutlej rise to an elevation of upwards of 18,000 feet.—*Dr. Thomson's Travels in Western Himalaya and Tibet*, page 71.

MIRUKAR, HIND. *Eragrostis*, sp.

MIRWAHA, or Badkush, PERS. A fan.

MIRWARI, A Brahui tribe located in Mushki, Jhow and Kolwah. The Brahui entered from the west and point to Khozdar as the capital prior to occupying Kelat. See Kelat.

MIRYALA TIGE, TEL. *Piper trioicum*, R. i. 151.

MIRZANJOSH, HIND. *Origanum normale*.

MIRZAPUR, a town of the Benares district on the right side of the Ganges, in L. 25° 9' 3"; L. 82° 33' 9" 362 feet above the sea. Mirzapore has no ancient importance or renown like Rajmahal, Bhagulpore, Monghir, Patna, Benares, but, excepting the last, it has eclipsed all the towns and cities in the Gangetic valley. It has grown and prospered under the British rule since the latter part of the 18th century and as a mart of trade ranks next to Calcutta and Bombay. Its corn, cotton, and the dyes of one-sixth of India, are sold here. Mirzapore has risen purely from commercial causes, unconnected with

MIRZA-SALIM.

religion or the auspices of royalty. In Mirzapore is seen the most beautiful chowk of all India. Four miles from Mirzapore is the temple of Bindachini. Here is seen the only instance of Kali in all Hindoostan, Forest races occupy the mountainous region of India from Mirzapore to the shores of the Bay of Bengal, and along the Eastern and Western ghaut mountains running on both sides of the peninsula. The Cheroo race are found in Ghazeeপুর, a part of Gorukpur, the southern part of Benares and Mirzapur and Behar. They are sometimes said to be a branch of the Bhur. They seem to be the same as the Savira or Seoree, but Buchanan considers them distinct. The Cheroo declare themselves to be descended from the great serpent, from which they may be supposed to be the Nagbunsi of Magadha. Remains of buildings attributed to them are found near Budha Gya, Sasram and Ramghur, and the images of Siva and Hanuman found in them indicate that they belonged to the hindu religion. They appear to have been expelled from their ancient abodes by the Pramara of Bhojpur, the Hyobun of Hardi and the Bhoonhar, a little before the first mahomedan invasion, about which time there seems to have been a general convulsion in India, during which several tribes acquired their present possessions. The features of the Cheroo are said to resemble the occupants of the Vindhya mountains. They live by cutting timber, collecting drugs, and killing game, and though their numbers are very low, they continue to create a rajah for every five or six houses, and invest him with the tilak in due form. The emperor Sher Shah subdued Mulartu, a Cheroo zemindar of Behar, which seems to have been a last strong effort of the Cheroo race. The chief of Singrowli in Mirzapur is a Cheroo, though he calls himself a Benbans. Sir H. Elliot suggests that the Sivira, Seori and Cheroo, may perhaps be the Saura, descendants of the Suraseni. In the Harivansa is the following passage:—"from this race came the Sauravira and Saurasena. The great king Saurasena has given his name to the country over which he reigned." *Elliot's Supp. Glossary. Travel of Hind. Vol. I. p. 136 137.*

MIRZA-SALIM, the Jehangir of Indian history, was born near the abode of Moin-ud-Din, Chisti. They show to this day, 'the little roof of tiles, close to the original little dingy mosque of the old hermit, where the empress gave birth to Jehangir.' There is not a greater among mahomedan saints than the wali Moin-ud-din, who was a Persian of Cheest, but whose holy dust remains in

MISHMI.

Ajmir. The empress happened to be pregnant about the time, and remained in the vicinity of the old man's hermitage, till the promised boy was born.—*Tr. Hind.*, Vol. ii. p. 4.

MIR-ZUN-JOOSH, ARAB. Majoram.

MIRZWIEBEL, properly Meerzwiebel, GER. Squill.

MIS or MISSI. HIND. Sulphate of Copper.

MISHMI, a race N. E. of the Abor and Mir-Abor hills occupying the hills in lat. 28 N., and long. 96 to 97 E. on the north of the Brahmaputra river at its source. They are N. W. of the Langtam range. In the country to the east of Assam, between India and China, the Mishmi mountains which occupy the most northerly part, are the southern and western slopes of a mass of snowy mountains which sweep round the N.W. of Assam from the east bank of the river Dihong to the sources of the Dihong. The Khamti and the Mishmi and the Midhi or Chulkatsa Mishmi dwell to the east of the Dihong river on the north of the Lohit or Brahmaputra river between the North and East Branches. They are divided into several tribes, one of which is the "Chulkatsa" or "Cup Haired." With them are mixed up Abor tribes and some Khamti tribes. The people of the Mishmi hills, have their frontier touching that of the Abor or Padam, on the drainage of the Dihong and Dibong, in small villages: the Mishmi and Padam acknowledge a common origin and eat together. They use the bow and cross-bow and poisoned arrows and are often at war on the surrounding tribes. Their chiefs dress in Chinese and Tibetan clothes and ornaments. Polygamy is allowed. The Mishmi sacrifice fowls and pigs to the rural deities. They engage in trade: forge iron and build suspension bridges. The Buhajia, Taying and Mijlu are Mishmi tribes. The Singpo march on the N. W. with the Mishmi who occupy the eastern mountainous extremity of the basin of the Brahmaputra, and on the W. and S. W. with the Naga and Manipuri tribes. In the interior of Arakan and between it, and the Kynduayn river, several tribes are scattered over the highlands to the south of the Kuki, Naga and Manipuri tribes, with Tibet, the northern banks of the Lohit, and through the Mishmi hills into Tibet called the Mishmi route. The Mishmi, who occupy the eastern extremity of the mountain borders of Assam, are said to have a rude phonology, characterised by peculiar tones and difficult consonants.—*Journal of the Indian Archipelago*, Nos. IV.

MISSI.

and V. April and May 1853, p. 189. *Latham's Ethnology*. See Bibor, Jubar, Kulita or Kolita, and India.

MISHNISH, PERS. *Armeniaca vulgaris*, Lam. Apricot.

MISHQAL, — ? a weight. See Misqal.

MISHRA-KESHI, SANS. from mish, to mix, and kesha, hair.

MISHTEL. See Khyber.

MISI. Misian. HIND. of Panjab land with a light sandy soil.

MISK, also Musk, ARAB. PERS. Musk.

MISR, HIND. Egypt.

MISR. In the districts of Gorakhpur, Azinghar and Benares, is an agricultural tribe who call themselves Bhuin-har or Bhun-har. They claim to be brahmans, and take the titles of Thakur, Misr, and Tewari; the rajah of Benares belongs to them. *Wilson's Glossary*.

MISR, or Misra, less correctly Mishar, HIND. Sansa, a name given to a brahman of the Kananja tribe, and especially to the members of two of the sub-divisions, Go't, or families belonging to it, those of the Sandal, and Katyayana or Viswamitra Go't: the term Misr was conjectured to have been connected with the ancient name of Egypt Misr, as if some of the brahmans had come from that country: it is more probably of affinity to Misra, mixed, indicating some mixture of race or family, the tradition of which has perished. See Misser.

MISREYA, also Sitasiva, also Seleya. SANS. Dill seed.

MISRI. HIND. *Saccharum officinarum* sugar.

Misri-lei, HIND. *Tamarix orientalis*.

Salib-misri, HIND. *Eulophia campestris*.

Shakak-ul-misri, HIND. *Eryugium planum*.

Shalgham-misri, HIND. *Canavallaria verticillata*.

MISS, PERS. Copper.

MISSI, AR. HIND. A powder made from gallnuts, sulphate of copper, steel filings, mirobalans, and the pods or gum of the keekur tree: the hindoo and mahomedan women use it in staining the teeth black. It is a vitriolic dentifrice to dye the teeth black. It is rubbed into the roots of the teeth, Burton says as an antiseptic, and a preservative against the effects of the quicklime chewed with betel nut. But the colour is between rust and verdigris and the appearance unnatural and offensive and it is more probably a custom resembling that of Japan, and like that of the Kyan of Prome, adopted to destroy the natural attractiveness of the married women, for it is only applied to married women's teeth.

NITAKSHARA.

Heera-kassis, is a dry per-sulphate of iron, used in dyeing, in making ink, blackening leather, used in medicine, and made into, "Missi" to apply to the teeth. To make

Black missi, take of Heera-kussees, chaipal harra, chooni-gond, lila tootiya, iron filings, kuth, equal parts, pounded and mixed: rubbed on the gums. For

White missi, take of Safaid soorum (crystallized carbonate of lime, double refracting spar), and cinnamon pounded together; is used as tooth powder.

Sadu-kussees, is an impure sulphate of iron, the refuse from the manufactory of the sulphate of copper: four seers for one rupee.—*Herklots. Gen. Med. Top. p. 137. Burton's Sind, Vol. i. p. 277.*

MISSEL THRUSH the *Turdus viscivorus*, performs an up-and-down migration on the western ranges of the Himalaya, being found at high elevations in summer, and in the more sheltered situations of the valleys during winter. The black throated thrush, *Turdus atrogularis*, is generally distributed over the woods and cultivated tracts of these ranges. The black throat is wanting in some varieties, and there are several well marked similarities to what has been called the red-necked thrush, *Turdus ruficollis*, which Mr. Hodgson considers a distinct species. *Adams, Sportsman in India.*

MISSEMA, there are here no springs but there are several cisterns. *Robinson's Travels, Vol. ii. p. 131.*

MISSER, also *Mitter*, i. e., *Mithra*, is a term given to brahmins in the Punjab and along the Ganges, where not distinguished as pundits or men of learning. It seems to have been introduced by the mahomedans.

MISSING, also *Messing*, also *Geelkoper*, *Dut. Brass.*

MISSI SAFED, *Hind.* Oxide of zinc.

MISSI SIYA, *Hind.* Oxide of manganese.

MISSREYA, *Sans.* *Anethum sowa, Rich.*

MISWAK, *Hind.* A twig of a tree used as a tooth brush, a substitute in India for a tooth brush, made from a twig of the margosa: the rough *Achyranthes*: *Careya arborea*, *Phyllanthus multiflorus*, and the *Palmyra*. It is a twig of any soft wood chewed at one end and is generally used throughout the east, where brushes should be avoided, as the natives always suspect hogs bristles.

MISWA. *Hind.* The butai miswa is the *Astragalus multiceps*.—*Burton's Pilgrimage to Meccah, Vol. i. p. 34. Herklots.*

MITAKSHARA. This is a work by Vijnaneswara Bhatta who flourished in the tenth century of the christian era. It is a commentary on the law-book of Yajna-

MITHILA.

ky, which again is an abbreviation of *Mann*, composed in the fourth or fifth century and more suited to modern requirements than the older work. The *Mitakshara* is still the chief authority in all parts of India on civil contracts and the law of inheritance and a good edition and translation are much to be desired. The little work of Stenzler (Berlin 1849) contains a clear edition of the text and faithful translation of Yajnavalkya's couplets.

MITE. *Eng.* Species of *Acarus*. The *Acarus coffeo* or coffee mite, is so small as to be hardly perceptible to the naked eye. It is closely allied to the "red-spider" of the hot houses of Europe. Nearly all the year round, but chiefly from November to April, it feeds on the upper side of the coffee leaves giving them a brownish sun burnt appearance. Individual trees suffer from its attacks, but the aggregate damage from it is not great.

MITHA. *Hind.* Fresh; sweet; hence,

Mitha-nebu, sweet citron, var. of *Citrus medica*; also *Citrus limonum*. *Citrus limetta*. *Risso and Poit.*

Mitha-dodiya *Convallaria*.

Mitha kadnu, *Cucurbita maxima*, *Cucurbita hispida*.

Mitha-kamaranga, *Averrhoa carambola*.
Mitha lakri, *Glycyrrhiza glabra*.

Mitha-tel, *til-ka-tel*, gingelly or sesamum oil. Oil of *Sesamum orientale*.

Mitha-tenda of *Sutlej*, fruit of *Diospyros tomentosa*, bill ebony.

Mitha titin, or *mitha bish*, *Aconitum ferox*.—*Wall. Cat. Aconitum napellus*.

Mitha-zahr, *Aconitum*;

Katta mitha, *Rumex vesicarius*, also *Oxalis corniculata*.

Mitha zirishk, *Vitis Indica*.

MITHAGARI, *Mar.* and *Guz.* A caste who manufacture sea salt.

MITHAI, *Hind.* Sweetmeats, sold in the bazars of India or by itinerant vendors. There are many kinds, but they are chiefly formed of sugar, clarified butter (ghi) and wheat flour; or milk and sugar, or with various pulses of fruits and sugar. The bazar sweetmeats are not palatable to Europeans.

MITHA-LONARI *Mar.* A caste who make salt, from island saline deposits or on marshes.

MITHI, properly *Methi*, *Duk. Guz. Hind.* Seeds of *Trigonella foenum-græcum*.

MITHIGA, *Hind.* *Louiciera angustifolia*.

MITHIGACHNI. See *Gachni*.

MITHI - SABZ - KHURDANI of *Dera Ghazi Khan* "fuller's earth."

MITHILA. The country north of the Ganges, between the Gandak and Kosi rivers, comprehending the modern provinces of *Puraniya* and *Tirhut*. The remains of

MITHRIDATES.

the capital founded by Janaka, and thence termed Janakapur, are still to be seen, according to Buchanan, on the northern frontier; at the Janickpoor of the maps.

Nearly coeval in point of time with Ayodia was Mithila, the capital of a country of the same name, founded by Mithila, the grand son of Ieshwaca. The name of Janika, son of Mithila, eclipsed that of the founder, and became the patronymic of this branch of the Solar race. These are the two chief capitals of the kingdoms of the Solar line described in this early age; though there were others of a minor order, such as Rotas, Champapoor, &c., all founded previously to Rama. By the numerous dynasties of the Lunar race of Boodha many kingdoms were founded. Much has been said of the antiquity of Poorag; yet the first capital of the Indu or Lunar race appears to have been founded by Sehesra Arjoona, of the Hihya tribe. This was Mahesvati on the Nerbudda, still existing in Maheswar. The rivalry between the Lunar race and that of the Soorya race of Ayodia, in whose aid the priesthood armed, and expelled Sehesra Arjoona from Mahesvati, has been mentioned. A small branch of these ancient Hihya yet exist in the line of the Nerbudda, near the very top of the valley at Sohagpoor, in Bhagel-khund, aware of their ancient lineage; and, though few in number, are still celebrated for their valour. Koosust'hulli Dwarica, the capital of Krishna, was founded prior to Poorag, to Soorpoor, or Mat'hoora. The Bhagvat attributes the foundation of the city to Anirt, the brother of Ieshwaca, of the Solar race, but states not how or when the Yadu race became possessed thereof. The ancient annals of the Jessulmer family of the Yadu stock give the priority of foundation to Poorag next to Mat'hoora, and last to Dwarica.—*Tod's Rajasthan*, Vol. I. p. 39.—*IV:son's Hindoo Th.* Vol. I. p. 298.

MITHU a kind of root used as salep, *Convallaria* sp.

MITHUNKOTE, See Khyber.

MIT-HWA. BURM. Charcoal.

MIT-PATTAR, HIND. *Machilus odoratissima*.

MITRA. the sun, the object of worship of the ancient Aryans, the Bactrian sun-god. Mitra is not mentioned in the Gatha of Zoroaster. In the Vedas, he is rarely invoked alone but generally along with (Ourano-) Varuna, the heavenly vault. In the later Iranian religion, Mitra is included as one of the Yajata and in the Mitra prayers he addresses Ahura mazda. It appears, that there were two forms of worship in Vedic India; the one, domestic, universal, celebrated three times a day;—the other, rare and exceptional; but both blended by a compromise into one incongruous whole; and both gross, and sensual almost beyond belief. The worship of the elements was clearly the national faith, with its offerings of the fruits of the earth, soma juice, barley, milk and butter. Animal sacrifice came from without, corrupted more and more and at last losing sight altogether of its original import, and coming to them perhaps from the wild nomades of Central Asia. The fair inference is that Indra and fire worship was the later form on Indian ground. The so called aboriginal tribes still sacrifice buffaloes and other animals; but there is no trace of fire worship among them. On the other hand the Viswamitra or Agnisara, claim the honour of having been the first to introduce the worship both of Agni and Indra, in various sakta of the Veda. Viswat Mitra, however, was the name of a body of immigrants viswamitra, "the men, or people of Mithra.

Agastya, a native of Tibet, is a maha muni, of great celebrity in the legends of Southern India. He methodized the Tamil language, and is the chief Tamil medical authority. He is estimated to have lived in the sixth century B. C., but the Tamulians suppose him to have lived long

MIZZ.

anterior to this. According to hindu legend, Agastya was the son of Mitra and Varuna conjointly, and born in a water-jar along with Vasishth. Having commanded the Vindhya mountain to lie prostrate till his return, he repaired to the South of India, to Kolapur, where he continued to reside and appears to have been mainly instrumental in introducing the hindu religion into the Peninsula.—*Wilson's Hind. Theat. Vol. I. p. 313 Rev. W. Taylor. Dr. Caldwell As. Soc. Trans. Vol. III p. 213. See Hindu.*

MITRA SANS. a friend, from mid, love.

MITRAGUPTA. Son of Chandra Gupta, was known to the Greeks by the name of Allitro. Diamachus was an ambassador from the Greeks of Babylon to Mitra Gupta.

MITRA, a genus of shells. See Molluscs.

MITRA CORRUGATA, and Mitra Episcopalis. See *Voluta vesperilio*.

MITRAVINDA. SANS. from mitra, a friend, and vid. to obtain.

MITREMYCES. See Fungi.

MITRA-CACA. See Lakshmi.

MITU, HIND. *Rubia cordifolia.* Buti ka Mitu, also mochka, Hind. *Boletus igniarius.*

MIYAN, a Hindustani word for "Sir," is known to the Bedouins all over El Hejaz; they always address Indian mahomedans with this word, which has become contemptuous, on account of the low esteem in which the race is held. *Burton's Pilgrimage to Meccah Vol. I. p. 341.*

MIZDZHEGI. See India.

MIZPEH, See Sacrifice.

MIZRAK, a weapon peculiar to certain Arab tribes, as the Karaghi and the Lahyani, and some, like the Hindayli near Meccah, make very pretty as well as very useful darts. The head is 15 or 16 inches long, no where broader than an inch.—*Burton's Pilgrimage to Meccah, Vol. I. p. 348.*

MIZZ, AR., in colloquial Arabic *Misd*; are the tight-fitting inner slippers of soft Cordovan leather, worn as stockings inside

MOANA.

the slipper; they are always clean, so they may be retained in the mosque or on the divan.—*Burton's Pilgrimage to Meccah Vol. II. p. 34.*

MJED, also Krasnoimjed, Rus. Copper.

MJEL, Rus. Chalk.

MJELOIZCHNUE; also Towarii, Rus. Hardware.

MLECHCHA. A term applied by the Arian immigrants to the peoples whom they found occupying India. Now, a person, other than a hindu. This name long continued to be applied to all the unsubdued Un-Aryan tribes in India. The aboriginal Scythian inhabitants of India seem to have been subdued and transformed from mlechchas into sudras, by slow degrees. In the age of Mann they retained their independence, and the appellation of mlechcha in Bengal, Orissa and the Dekhan; but in the earlier period which is referred to in the historic legends of the Mahabarata, the mlechcha and dasya are mentioned as disputing the possession of Upper India itself, with the Arya, and in conjunction with certain tribes connected with the Lunar line, they succeeded in overrunning the territories of Sagara, the thirty-fifth king of the Solar dynasty. The mlechcha are alluded to in the Mudra Rakshasa, a fact corroborative of that drama's being written in the eleventh or twelfth century, when the Pat'han princes were pressing upon the hindu sovereignties. To the hindu, every man not twice born was a mlechcha.—*Hind. Theat. Vol. II. p. 251. See Hindoo, India, kashmir Sudra, Mliia, Semitic races, Muskires, Greeks of Asia.*

MO'EDAN. Those Arab tribes which are of a pure Arab race, live on the flesh of their buffaloes, cows, and horses, and on the produce of some little ploughing. The tribes, distinguished as noble by their possession of camels, are denominated Aleu-cl-Aleaar; and the others Mo'edan. The latter are esteemed a middle class, between genuine Arabs and peasants. Niebuhr heard some tribes mentioned contemptuously, because they kept buffaloes and cows. The Mo'edan transport their dwellings from one country to another, according as pasturage fails them, so that a village often arises suddenly in a situation where, on the day before, not a hut was to be seen.—*Niebuhr's Travels, Vol. ii. p. 159 160.*

MOAGHA. TEL. Morinda, *sp.?*

MOAMERIA, See Singhpoo.

MOANA, or Miani or Meyanna, in Sind and in Cutch, are mahomedans of loose character. See Mohana.

MOCHA COFFEE.

MOAR, a river of Malacca, which rises in the mountains of Pahang.

MOAR NUDDY runs near Jumna Kande in Berhampoor.

MOASHUR. HIND. A variety of magic squares.

MOAT, DUK. and HIND. *Phaseolus. sp.*

MOAWIYAH IBN ABI SOFIAN was governor of Syria, but renounced allegiance to Ali, and proclaimed himself khalif of the western provinces. The khalif Moawiyah, after having (A. D. 671-678), for seven successive summers renewed the endeavour to take Constantinople, at length felt himself under the necessity of sending envoys to sue for peace from the emperor Constantine Pogonatus. The latter agreed, and sent the patrician Joannes Petzigaudius (the Yenyo of the Chinese) to Damascus to conduct the negociation with the Arabs. The result was that the latter pledged themselves to a thirty years' peace, and to pay to the empire every year 3000 pieces of gold, fifty slaves and fifty horses.—*Yule, Cathay* I p. 60.

MOBARKHA. HIND. *Adiantum lunulatum Burm. Spr.*

MOBID, ARAB., from *abid*, AR, a Parsee priest.

MOBYE. See *Karen*; *Shan*.

MODDER-CANEEL, also *Hout Kassie* DUT. *Cassia lignea*.

MOCHA, a town in Arabia. It has no pretensions of antiquity having had its origin about 1430, by the people flocking around the learned Sheikh Ali Shaduli ibn Oman. About the beginning of the seventeenth century, the English and Dutch East India Companies established factories there, and carried on a lucrative commerce with the Indian ports. At this time the revenues amounted to Rs. 75,000 per annum; ships from all parts of the East entered its harbour, and caravans from Egypt, and Syria, and from the Eastern nations of Europe flocked to its markets. In the beginning of the 18th century the French established a factory at Mocha, which was then at the height of its prosperity. Its trade with America and Europe continued unabated until 1839 when Aden having become a British Port, Mocha rapidly and steadily declined, its condition became indescribably deplorable; and in 1857 its Customs dues of Mocha sold for Rs. 48,000. The country around Mocha is a barren plain. Mocha, has a population of twenty thousand.—*Playfair's Aden*.

MOCHA BENG. HIND. *Musa sapientum*.

MOCHA, See *Kyan*.

MOCHA KAI. TAM. Galls.

MOCHARO MATIR—"The charming Matir, a district near Omerkot, celebrated in Sindhi pastoral poetry as the Arcadia of that ill favoured land.

MOCHA-RAS, varieties of gum, from *Bombax Malabaricum* or *B. heptaphyllum* and *Hyperanthera moringa*. See *Moch-ras*.

MOCHA STONES and Moss Agates are semitransparent calcedonies, including various ramified forms, produced by iron, manganese, bitumen and chlorite or green earth, but sometimes also, as has been proved by Daubenton and MacCulloch, produced by the presence of real vegetable bodies, such as *Confervæ* and Mosses. The finest are found in Guzerat, but received their name not from Mocha or Mokha on the Red Sea, but from the word *moch* which is used by the Saxon miners to express those spots resembling moss, that distinguish agates of this kind.—*Millin's "Dictionnaire des Beaux Arts" in Ousley's Travels* Vol. I. p. 433.

MOCHAYET, *Forsk.* *Cordia myxa*.

MOCHHAL. TAM., a Ceylon tree about twenty inches in diameter, and eight or ten feet high. Its wood is used in native boats, &c. It produces a fruit from which oil is extracted.—*Edye Ceylon*.

MOCHL, a shoemaker, a worker in leather, commonly applied to one who is by caste and occupation a shoe-maker, a harness maker, or saddler, in the south of India, a worker in leather and saddlery, a book binder a cabinet or furniture maker and a portrait painter. In S. India, a *muchi* is employed in public offices, like a *daftari* in Upper India, to make pens, ink, provide paper, seal letters, bind books, and the like.

MOCH-RAS the gum of *Bombax heptaphyllum*, but also applied to the gum of *Hyperanthera moringa*. One kind is a very highly astringent dark colored gum much used in medicine by natives. A variety of *phul supyari* is obtained from the *Areca catechu* and seems to be called *saigata gond*, in Gurgaon.—*O'Shaughnessy*, p. 227. *Powell Hand Book*, Vol. I. p. 397. See *Mocha-ras*.

MOCOA, A genus of mammals of the family *Scincidæ*.

MOCRAN, See *Kej Mekran*.

MOD. MAH. The broken or cursive or running hand-writing used by the Marathas on ordinary occasions.

MODA-COTTAN. TAM. *Cardiospermum halicacabum*.—*Linn.*

MODAI KOCHI. See *India*.

MODAKA, SANS. from *mood*, to rejoice.

MOGHOSTAN, See Kirman.

MOGHSI, HIND. *Macrotonia euchroma*.

MOGHU, BENG. *Bignonia suaveolens*.

MOGHUL, a term derived from the great Tartar Mongol tribes, is used in India as a distinction of their descendants. As a title it was especially applied to the sovereigns of Delhi of the house of Timur, although they were equally at least of Turk descent, and presented in their appearance entirely Turkish characteristics. Mahomedans in India are divided into the four great classes, Syed, Shaikh, Moghul and Pathan. The Arab shaikh are of three origins, the Korshi Mahomed's tribe; the Siddegee; Aboo Bakr's tribe; and the Farooqee or Oomer's tribe. The Syed or Saadat are all descendants of Mahomed through his daughter Fatimah. The Moghul however are of two countries, the Irani or Persian and Toorani or Turkish. The Pathan tribes are mahomedans from Afghanistan. These classes may be and are often, indifferently of the shiah or sunnee sect of mahomedanism. There are other small sects and classes, as the Nowart, the Ghur-Mohdi, Ishmaelee, Lubbay, Bora, Moplah &c. On the N. W. frontier the term Moghul, is applied to the people of Afghanistan who speak Persian. In Kabul, the mahomedans are divided into Pathan and Moghul (or new Pathan) the latter being chiefly Kazzilbah. There are considerable settlements of Syeds holding villages in jaghir. The mahomedans termed Sheikh are neither Moghul, Syed nor Pathan. There are many respectable landholders and some village communities who take the designation of Sheikh, as for instance the old proprietors of Lucknow, when it was but a village. Mr. Campbell regards those in the north of India as possessing considerable traces of a north-western origin from the hilly countries of the North Western Arians being fairer and some of them with high features of the Arian type, handsome faces, features and beards. The emperor Baber, who, though a Turk was himself descended by the mother's side from Mogul ancestors, gives the following

MOGHUL.

account of the Moguls in his service—"The horde of Moguls have uniformly been the authors of every kind of mischief and devastation." Being dispossessed of the northern parts of his dominions by the Usbees, Baber determined to try his fortune in Hindoostan, whose distracted situation flattered his hopes of conquest. His residence at this time was at Cabul, from whence he undertook his first expedition across the Indus, in 1518. After this, he made four others: and in the fifth (A. D. 1525) he defeated the emperor of Delhi, and put an end to the dynasty of Lodi. It is said that Baber crossed the Indus, this last time, with only 10,000 chosen horse; the enemy's generals, by their revolts, furnishing him with the rest of his army. Baber was the founder of the empire of the great Mogul in India, and was, after Timour, the greatest genius of his race; his memoirs, which he wrote during the latter part of his life, comprise one of the most curious and interesting works in eastern literature. The Mogul is not a gloomy, intolerant fanatic like the Patan, but good natured and conciliatory, who made it his policy to amalgamate the foreigner with the natives of the soil. Under the Mogul, arts, manners, costumes and tastes all took a new character. The Mogul assumes the sash of Beg. They are comparatively few, in number, are generally fair people, of a larger physical frame than the Arab-Mahomedans and are all of unassuming manners. In more recent times, the term Moghul was applied by the nations of Europe to the localities which they have occupied or with which they have traded. With the Portuguese the northern part of Hindustan held by the Moghul sovereigns, was styled Mogor, and Goa and the Western Coast of the Peninsula was to them India, just as the British now designate as India all their possessions in Hindustan and the two Peninsulas, and as with the Dutch now, India means Java, Sumatra, and the Netherland possessions in the Archipelago. The Moghul dynasties of India beyond palaces and tombs, porticoes and temples have, however, left little worthy of emulation. There are a few useful sarai and bridges, but of these many were erected by private persons. The aborigines of Bokhara are the Tajik whose origin and time of immigration to Bokhara are unknown; previous to the conclusion of the first century of the hijira, the Arab-mahomedans penetrated into their abodes, and forced them at the point of the sword to embrace the new creed. At that period, Bokhara was govern-

MOHANA.

ed by the race of the Samanides. In the tenth century, the weak rule of these princes was totally overthrown by the Usbeks, whose power was not of long duration; for in the twelfth century the khanat of Bokhara was deluged by the overwhelming flood of the Moghul hordes of Chenghiz-khan, and the Uzbeks were expelled by the Moghuls into the desert to the west of the Sar-i-Dariya. *Campbell*, p. 100-101.—*Elphinstone's History of India* Vol. 11. p. 37. *Rennell, Memoir* p. lvi. *Travels, of a Hind* V. II p. 255. *Yule, Cathay* ii p. 549.

MOGILI, TEL. Caldera bush, Pandanus odoratissimus Mogili-pu, its flower.

MOGOR, Mogol, a Maharrum faqeer.

MOGOR, with the missionaries of the 15th century and the Portuguese, was their name for Hindustan, held by the Moghul sovereigns; with them India meant Goa and the Western Coast just as with the Dutch now India means Java and Sumatra; *Yule Cathay* II. p. 549.

The hair of the Angora goat, soft, fine as silk, and of a silvery whiteness.—*Faukner*.

MOHAKRI, HIND. Bryonia umbellata.

MOHAMMERAH a town in the Persian gulf at which the Indian army landed in 1855 when attacking Persia. After a great accession to its waters, the Shatt el Arab inclines a little more towards the South; during the remainder of its course it passes many large villages, and almost continuous belts of date-groves; and at length it reaches the sea, which, at the bar, is forty miles from Mohammera. See Chaldea, Kajar, Khuzistan, Arabistan, Mesopotamia.

MOHANA, a fisherman caste in Sindh, who appear to be a tribe of converted hindus: their own account of their origin, however, is as follows:—When Sulayman, the son of David, was amusing himself by ballooning over Cashmir, he met a horrible looking woman, and, although the wisest of human beings, was puzzled to conceive what manner of

MOHANA.

man it could be that would marry her. Some time afterwards, the prophet king lost his magic ring by the wiles of Sakhar, the demon, who ascended his throne, seized the palace and drove out its lawful owner. Sulayman, impelled by destiny, wandered to Cashmir, and there became the husband of that "grimme ladye." Her dowry was every second fish caught by her father, who happened to be a fisherman. As usual in such tales, the demon soon lost the ring, and it was found in the stomach of one of the fishes. Thus Sulayman recovered his kingdom. His wife, who remained behind in a state of pregnancy, had a son, who became the sire of the Mohana. The Mohana do not look like the Sindhi people. Their features are peculiar and the complexion very dark: some of the women are handsome when young, but hardship, exposure to the air, and other causes, soon deprive them of their charms. They are to be found chiefly about the lakes of Manchar, Maniyar and Kinjur. At the latter of these places are some ruins of a palace built by Jam Tamachi, one of the rulers of Sindh, who married Nuren, the beautiful daughter of a fisherman. The event is celebrated in the legends of the country, and Shah Bhetao, the poet, has given it a Sindhi immortality in one of his Sufi effusions. The Mohana are by no means a moral people. Their language is gross in the extreme, and chastity seems to be unknown to them. The men are hardy and industrious, but incurably addicted to bhang, opium, and all kinds of intoxication. Probably, their comfortless and precarious life, half of which is spent in or near the water, drives them to debauchery. They are admirable swimmers, as might be expected: the children begin that exercise almost as soon as they can walk. The Mohana, though depraved, are by no means irreligious. They keep up regular mosques and places of worship, with Pir, Mulla, and all the appurtenances of devotion. The river Indus is adored by them under the name of Khwajeh Khizr, and is periodically propitiated by a cast offering of rice, in earthen pots covered with red cloth. There are many different clans among the Mohana race. Their caste disputes are settled by the head men, who are called "Changa Mursa," and invested with full powers to administer justice to those who consult them. After betrothal, the prudent parents do all they can to prevent the parties meeting, both, however, are permitted to visit one another's relations of the same sex. Among the upper classes any prægustatio matrimonii is considered disgraceful: but accidents

MOHOLO.

are not of rare occurrence. It is the same in Affghanistan, and other parts of Central Asia, where the mother of the betrothed not unfrequently connives at what is called Namzad-bazi, or visiting the future bride, unknown to the father. The word, however, does not imply any scandalous occurrence, and of course where the use of the sabre is so unrestrained the danger is diminished. In Sindh the lower classes, such as the Mohana and others, think they have a right to intrigue with their futuro brides: some of them will go so far as to consider the mother-in-law a substitute for her daughter until the latter is of an age to be married.—*Burton's Sindh*, pp. 251, 252-3, 261-2.

MOHANAM or Chilagadam, TEL. *Batatas edulis*, Ch. a erythrorrhiza. 822.

MOHANNA, a river near Ryeepoor in Rewah.

MOHAO, a rivulet or naddi near Shahzadbari in the Moradabad circle.

MOHARRAM, the first month of the mohamedan year in which a festival is held in India celebrated by a kind of dramatic representation of the events of that period. See Mohurram.

MOHAS, a river of Budaon.

MOHAUT—? also Mohant—? *Hibiscus tiliaceus*.

MOHE-KA-JHAR, HIND. *Bassia longifolia*, *Wilde*. Mohe ka tel. Its oil Moho ka phul, its flower.

MOHINI, SANS. from mooh to be infatuated. In hindu mythology the female form of Vishnu with whom Siva associated and Mohini brought forth Ayanar.

MOHNI-KA-KAJUL, HIND. the philter lampblack.

MOHNSAFT, GER. Opium.

MOHO, MAR. *Bassia latifolia*.

MOHOE—? *Hibiscus*.

MOHOLO, URIA. *Bassia latifolia*? Under these names, Capt. Macdonald describes a tree of Ganjam and Gumsur, of extreme height 50 feet, circumference 8 feet, and height from the ground to the intersection of the first branch, 36 feet. Used for boats and the flooring of cattle sheds is often made of this wood, the tree is highly prized by the hill tribes on account of intoxicating liquor which they distil from its flower. The latter is made into a sort of sweetmeat by the Urya race who mix sugar and rice with it. The fruit in its unripe state is boiled and eaten as a vegetable. The fruit yields an oil termed "Jolo Jelo," this is purchased by the bukals for the purpose of adulterating ghee, which it somewhat resembles in ap-

MOHURRUM.

pearance. This tree and the solopo palm are never destroyed by the Kond race when they clear a patch of jungle for the purpose of bringing it under cultivation, and in the time of the Gumsur rajahs, the rebellion of any of the hill tribes was often punished by cutting down all their mohoolo and solopo trees.—*Capt. Macdonald.*

MOHOR, or Mor, a Rajput tribe said to be of Bhatti origin.

MOHR, HIND. MALEAL. *Pavo cristatus.*

MOHR GER. Mohair.

MOHR. HIND. A kind of bamboo of Kangra.

MOHRI. HIND. *Aconitum napellus.*

MOHRO. HIND. *Quercus dilatata.*

MOHRU. HIND. *Quercus dilatata.*

MOHU. SANS. From muha, confusion or stupefaction.

MOHUA. BENG. *Bassia latifolia.*—*Willd.*

MOHUN LAL was the son of rao Budh Singh, the son of rajah Maui Ram, of Kashmir, who held a high rank, with a considerable estate, at the court of the late emperors of Delhi. He joined Lt. Alexander Burnes at Delhi and accompanied him into Samarcand and Bokhara, Lieutenant (afterwards Sir Alexander) Burnes, was then assistant resident in Cutch, but with his younger brother Charles he was killed in Cabool, on the 2nd November 1841.—*Mohan Lal's Travels*, p. 1—9.

MOHUNNA-YENNAI—? Wood oil.

MOHUR or Ashruffi, a gold coin, of India, now rarely seen, of fifteen rupees value so called from having the sun's image.

MOHUR. PERS. Seal.

MOHUR-BUNJ, — a tributary estate, to the S. E. of the Colehan. It has a rajah.

MOHURRUM. This is the first month of the mahomedan year; the first ten days of the month are held as a festival, which is celebrated as Christmas is, sometimes by strict religious rites or by great festivity according to the opinions or ignorance of the sects. The sunni mahomedans and learned mahomedans are generally most strict in the observance of their religious duties for the first thirteen days of this month. The other months in succession are:

Suffer,	Rajjub,
Rabbi ul Awul,	Shaban,
„ us Saui,	Ramzan,
Jomadi ul Awul,	Shawal,
„ us Saui,	Zu-ul-kaida.

Ashrah an Arabic word, from 'ashr' a tenth part, are the first ten days of the moharrum, or the ceremonies observed during that part of the month. Houses are appropriated in which they set

MOKLNA.

up the Allum, Taboot, Shah-nasheen, Booraq, &c., and sometimes screens made of mica. These places are called the Ashoor Khauah (ten day house); Tazeeah Khanah (the house of mourning); and Astana (a threshold or faqueer's residence). In upper Hindustan, opulent mahomedans erect an Imambara, and the shiahs generally follow a similar practice.—*Herklots.* See Moharram.

MOHWA. BENG. *Bassia latifolia.*—*Willd.*

MOI. The Di-ditsh, N' Guon, Moi, Ro-Moi and Ke-moi, rude tribes occupying the mountain ranges between Tonkin and Cochin China, and between Cochin China and Kambogia.—*Latham's Descriptive Ethnology.*

MOHUR PUNKHEE, Bayra, Kishtee or Juhaz.

MOI-TAI. The Kāthe or MoI-tai, a tribe in 94 E. L. and 21½ N. L. South of Mannipoor, with the Kom-naga in the S. W, the Lahooppa naga in the N. E. and the Kacharee on the west.

MOI-MOI. King Crabs of Achin.

MOINEE. An order of hindu devotees, who vow perpetual silence. They go almost naked, and smear their bodies with cowdung.—*Cole. Myth. Hind.* p. 339.

MOIRE. FR. Mohair.

MOIRA, Earl, afterwards Marquis of Hastings, Governor General of India from 1813 to 1821.

MOK. BURM. *Aloe Indica*, *Royl.* *Aloes.*

MOKALI. HIND. *Brassica rapa.*

MOKE HSO HLAN MA. BURM. *Desmodium* sp.

MOKETAMMATHA. BURM. Meaning Martaban wood. A tree of maximum girth 1 cubit, and maximum length 8 feet, found very abundant in Martaban and its adjacent jungles, also all over the provinces, especially on the banks of rivers. When seasoned, sinks in water: uncommonly heavy. Stated to be used for the same purposes as chisel handle tree, but still stronger.—*Captain Dance.*

MOKHA. See Mocha; Tehama.

MOKHERAJU. See India.

MOKKA, BENG. *Zea mays*: Maize.

MOKKA, also Perugu. TEL. *Amarantus oleraceus.* *Linn.*

MOKKA, BENG. *Bryonia scabra.*

MOKKA JUARI, HIND. *Zea Mays.* *Linn.*

MOKKA JONNA also Mokka Jonaloo,

TEL. *Zea Mays*, Indian corn.

MOKKA TOTA KURA or Perugu tota kura. TEL. *Amarantus oleracea*, L.—*Var. gigantea*, R. iii. 605.

MOKKA Vepa TEL. *Bignonia*, sp.

MOKNA, HIND. *Agaricus campestris.* See Ganga.

MOLLALU.

MOKSH, or *Moksha*, **HIND.** absorption in the deity, erroneously identified with heaven. See *Nibutti*.

MOKURBURJ, See *Kol*.

MOLAGAIGAL, **TAM.** Chillies.

MOLAGO KODI, **MALEAL.** *Piper nigrum*, *Linn.*

MOLAGHA TEL. *Morinda citrifolia* *Linn.*

MOLLAGHAI, **TAM.** *Capsicum frutescens*; Cayenne pepper.

MOLAGO VALLI, **TAM.** *Piper nigrum*, *Linn.*

MOLAKARANAY, *Toddalia aculeata*.

MOLA KAKAR UNNAY, **TAM.** Oil of *Scopolia aculeata* or *Toddalia aculeata*.

MOLA KOORA, **TEL.** *Amarantus polygamus*.

MOLAM, **TAM.** *Cucumis melo*.

MOLANDI, a piratical race mentioned by *Pliny*, *Arrian* and *Ptolemy*, on the western coast of India, near *Mt. Dilli*.

MOLANGI, See *Sunderban*.

Mollusc is a term derived from the *Latin* word *mollis*, soft, and *molluscs* are animals whose bodies are soft, but are mostly protected by an external shell. With naturalists, the whole of the animals of the world are arranged as under,

Kingdom, **ANIMALIA.**

Sub-Kingdom i; **VERTEBRATA.**

Class i. <i>Mammalia</i> .	Class iii. <i>Reptilia</i> .
" ii. <i>Aves</i> .	" iv. <i>Pisces</i> .

Sub-Kingdom ii **MOLLUSCA.**

Class i. <i>Cephalopoda</i> .	Class iv. <i>Brachiopoda</i> .
Class ii. <i>Gasteropoda</i> .	Class v. <i>Conchifera</i> .
Class iii. <i>Pteropoda</i> .	" vi. <i>Tunicata</i> .

Sub-Kingdom iii; **ARTICULATA.**

Class i. <i>Insecta</i> .	Class iv. <i>Cirripeda</i> .
" ii. <i>Arachnida</i> ,	" v. <i>Annelata</i> .
" iii. <i>Crustacea</i> .	" vi. <i>Eutozoa</i> .

Sub-Kingdom iv; **RADIATA.**

Class i. <i>Aculepha</i> .	Cl. iv. <i>Foraminafera</i> .
" ii. <i>Echinoder-</i>	Cl. v. <i>Infusoria</i> .
<i>mata</i> .	

Class iii. *Zoophyta*.

" vi. *Amorphozoa*.

The four different types upon which all known animals are constructed constitute as many natural divisions or sub-kingdoms. The first of these primary groups is characterized by an internal skeleton of which the essential or ever present part is a backbone, composed of numerous joints or vertebrae. These are the beasts, birds, reptiles and fishes, and are known as the *vertebrata* or *vertebrated* animals, meaning animals with a backbone.

The second type is the *mollusca* or soft bodied animals. Insects; spiders, crabs and worms whose bodies have many joints or articulations, called the *Articulata* form the third sub-kingdom, and the fourth is the *star-fishes*, sea jellies, coral animals and the countless microscopic creatures which

MOLLUSCA.

swarm in the waters. The mollusca are related to the zoophytes by the affinity of their simpler forms, and the higher classes of them to the fishes. So far as geological researches have gone, the four leading types of animal structure have existed simultaneously from the very beginning of life on the globe, and though perpetually varying in the form under which they were manifested they have never since entirely ceased to exist. Mr. S. P. Woodward arranges the mollusca as under.

CLASS I. CEPHALOPODA. CEPHALOPODS.

ORDER I. DIBRANCHIATA.

SECTION A. OCTOPODA.

Family I. ARGONAUTIDÆ.

GENUS, Argonauta. Argonaut or paper sailor; *recent*, 4 sp., *fossil*, 1 sp. *Syn.* octoœ. nautilus.

Family II. OCTOPODIDÆ.

GENERA, Octopus, *rec.* 46 sp. *Syn.* cistopus.
Sub-genus. Tremoctopus, *rec.* 2 sp.
 Pinnoctopus, Finned octopus, *rec.* 1 species.
P. cordiformis.
 Eledone, *rec.* 2 species.
 Cirroteuthis, *rec.* 1 species. *C. Mulleri.*
 Philonexis, *rec.* 6 species.

SECTION B. DECAPODA.

Family III. TEUTHIDÆ.—CALAMARIES, or SQUIDS.

Sub-family A. MYOPSIDÆ. Eyes covered by the skin.

GENERA, Loligo. Calamary, *rec.* 21 sp. *Syn.* teuthis.
Sub-genus. Teudopsis, *fossil*, 5 sp.
 Gonatus, *rec.* 1 species; *G. amœna.*
 Sepiotenthis, *rec.* 13 sp.
 Belotenthis, *fossil*, 6 sp.
 Geotenthis, *fossil*, 2 sp. *Syn.* belemnosepia.
 Leptotenthis, *fossil*.
 Cranchia, *rec.* 2 sp.
 Sepiola, *rec.* 6 sp.
Sub-genus. Rossia, *rec.* 6 sp.

Sub-family B. OIGOPSIDÆ. Eyes naked.

Loligopsis, *rec.* 8 sp.
 Cheiroteuthis, *rec.* 2 sp.
 Histiotenthis, *rec.* 2 sp.
 Onychoteuthis, Uncinated calamary, *rec.* 6 sp. *Syn.* ancistroteuthis. onychia.
 Enoploteuthis, Armed Calamary, *rec.* 10 sp. *Syn.* ancistrochirus and abralia. octopodotenthis.
 Ommastrephes, Sagittated calamary, *rec.* 14 sp.

MOLLUSCA.

Family IV. BELEMNITIDÆ.

GENERA, Belemnites, *fossil*, 100 sp.
 The belemnites have been divided into groups by the presence and position of furrows in the surface of the guard.

SECTION I. ACELL.

Sub-section 1. Acuarii, 20 sp.

2. Clavati, 3 sp.

Section II. GASTROCELL.

Sub-section 1. Canaliculati, 5 sp.

2. Hastati, 19 sp.

Section III. NOTOCCELL, 9 sp.

Belemnitella, *fossil*, 5 sp.

Acanthoteuthis, *fossil*, *Syn.* kelæno.

Belemnoteuthis, *recent*, also *fossil*.

Conoteuthis, *fossil*.

Family V. SEPIADÆ.

GENERA, Sepia, *rec.* 30 sp. *fossil*, 5 sp. *Syn.* belosepia.

Spirulirostra, *fossil*.

Beloptera, *fossil*, 2 sp.

Belemnosis, *fossil*.

Family VI. SPIRULIDÆ.

GENUS, Spirula, *rec.* 3 sp.

ORDER II. TETRABRANCHIATA.

Family I. NAUTILIDÆ.

GENERA, Nautilus, *rec.* 2 or 4 sp. *fossil*, 100 sp.

? *Stalagminum*. *Syn.* *Myoparo* *fossil*.
Isarca. *fossil*, 14 sp.
Sub-genus. *Cucullicella*. *fossil*.
Leda. *Syn.* *Lembulus*, *rec.* 30 sp. *fossil*, 110 sp.
Sub-genus. *Yoldia*. *rec.* also *fossil*.
Solenella. *Syn.* *Malletia*. *Ctenoconcha*.
Neilo, *rec.* 2 sp. *fossil*, 1 sp.
? *Solemya*. *Syn.* *Solenomya*, *rec.* 4 sp. *fossil*, 4 sp.

Family V. TRIGONIDÆ.

- GENERA. *Trigonia*. *Syn.* *Lyriodon*, *rec.* 3 sp. *fossil*, 100 sp.
Myophoria. *Syn.* *Cryptina*, *fossil*, 13 sp.
Axinus. *Syn.* *Schizodus*. *fossil*, 20 sp.
Lyrodesma. *Syn.* *Actinodonta*, *fossil*, 3 sp.

Family VI. UNIONIDÆ. NAIDES.

- GENERA. *Unio*. River-mussel, *rec.* 250 sp. *fossil*, 50 sp.
Sub-genera. *Monocodyla*. *rec.* 6 sp.
Hyria. *rec.* 4 sp.

MOLLUSCA.

Castalia. *Syn.* Tetraplodon, *rec.*
 Anodon. Swan-mussel, *rec.* 50 sp. *fossil*, 5 sp.
 Iridina. *Syn.* Mutela. Spatha, *rec.* 6 sp.
 Mycetopus. *rec.* 3 sp.
 Ætheria. *rec.*
 Mulleria. *Syn.* Acostæa (Guaduasana), *rec.*

SECTION B. SIPHONIDA. with respiratory siphons.

a Siphons short, pallial line simple.

Family VII. CHAMIDÆ.

GENERA. Chama. *Syn.* Arcinella, *rec.* 50 sp. *fossil*, 30 sp.
Sub-genus ? Monopleura. *fossil*, 9 sp.
 Dicerus. *fossil*, 5 sp.
 Requienia. *fossil*, 7 sp.

Family VIII. HIPPERITIDÆ.

GENERA. Hippurites. *fossil*, 16 sp.
 Radiolites. *Syn.* Sphærolites, *fossil*, 42 sp.
Sub-genus ? Bi-radiolites. *fossil*, 5 sp.
 Caprinella. *Syn.* Caprinula, *fossil*, 6 sp.
 Caprina. *Syn.* Plagioptychus, *fossil*, 5 sp.
 Caprotina. *fossil*, 4 sp.

Family IX. TRIDACNIDÆ.

GENERA. Tridacna. Clam-shell, *rec.* 6 sp. *fossil*, 1 sp.
Sub-genus. Hippopus. *rec.*

Family X. CARDIADÆ.

GENERA. Cardium. Cockle. *Syn.* Papyridea, *rec.* 200 sp. *fossil*, 270 sp.
Sub-genera. Hemicardium.
 Lithocardium. *fossil*.
 Serripes. *rec.* also *fossil*.
 Adacna. *rec.* 8 sp.
 Conocardium. *Syn.* Lychas. Pleurorhynchus. Lunulo-cardium, *fossil*, 30 sp.

Family XI. LUCINIDÆ.

GENERA. Lucina. *rec.* 70 sp. *fossil*, 200 sp.
Sub-genus. Cryptodon. *rec.* also *fossil*.
 Corbis. *Syn.* Fimbria. Idotea, *rec.* 2 sp. *fossil*, 80 sp.
Sub-genera. Sphæra. *fossil*.
 ? Unicardium. *fossil*, 40 sp.
 ? Tancredia. *Syn.* Mettangia, *fossil*, 11 sp.
 Diplodonta. *Syn.* Sphærella, *rec.* 12 sp. also *fossil*.
Sub-genera. ? Scacchia. *rec.* 2 sp. *fossil*, 1 sp.
 ? Cyanium. *rec.*
 Ungulina. *rec.* 4 sp.
 Kellia. *Syn.* Lasca. Cycladina. Bornia.
 Erycina. *rec.* 20 sp. *fossil*, 20 sp.
Sub-genera. Turtonia. *recent*.
 Pythina. *rec.* 2 sp. also *fossil*.

MOLLUSCA.

Montacuta. *rec.* 3 sp. *fossil*, 2 sp.
 Lepton. *Syn.* ? Solecardia (aburnea), *rec.* 3 sp. also *fossil*.
 Galeomma. *rec.* 3 sp. also *fossil*.

Family XII. CYCLADIDÆ.

GENERA. Cyclas. *Syn.* Sphærium. Pisum. Musculium, *rec.* 30 sp. *fossil*, 35 sp.
Sub-genus. Pisidium. *rec.*
 Cyrena. *rec.* 25 sp. *fossil*, 70 sp.
 ? Cyrenoides. *Syn.* Cyrenella, *rec.* 1 sp.

Family XIII. CYPRINIDÆ.

GENERA. Cyprina. *Syn.* Arctica, *recent* also *fossil*, 90 sp.
 Circe. *rec.* 37 sp.
 Astarte. *Syn.* Crassina. Tridonta. Goodallia, *rec.* 14 sp. *fossil*, 200 sp.
Sub-genus ? Digittaria. *rec.* ? also *fossil*.
 Crassatella. *Syn.* Ptychomya. Paphia, *rec.* 30 sp. *fossil*, 50 sp.
 Isocardia. Heart-cockle. *Syn.* Glossus. Buccardium. Pecchiolia, *rec.* 5 sp. *fossil*, 70 sp.
 Cypricardia. *Syn.* Trapezium. Libitina, *rec.* 13 sp. *fossil*, 60 sp.
Sub-genera. ? Coralliophaga. *rec.* 2 sp.

Tellina, species.

Nucula, sp.

Pallustra,

Balanus:

There appear amongst them many specimens of the ordinary *Placuna placenta* and other recent shells which would indicate their age to be that of Professor Lyell's postpliocene series in his post tertiary group. *P. placenta* does not now occur in any part of the seas near the Western Peninsula of India but is still found near Singapore.

The truncated molluscs are not known to be of any direct use to man, but they are interesting to the physiologist from the fact that they secrete a woody substance for their shells. So long as naturalists classified the mollusca, by the appearance of their shells, this branch of natural history was known as conchology, and two great divisions were the bivalve and univalve shells, *Brachiopoda* and *Lamelli-branchiata* shells, *Gasteropoda*, *Pteropoda* and *Cephalopoda*.

All shells consist of two layers, an upper or outer which is rough, and more or less developed and an inner layer, called nacre, which is smooth. The nacre consists of a series of delicate layers one over the other in an imbricated manner with their edges presenting a series of lines with waved edges. The brilliancy of the colours reflected from this iridescent surface depends on the thinness of the laminae or layers of the nacre; where the layers are thick, like those in the oyster, only a dull white appearance is presented, but, as in the ear-shell and mother of pearl shell, the iridescent colours reflected from the thin layers are beautiful, they are used for the ornamentation of papier-mache work and for other ornamental purposes. As seen in cabinets, the outer rough layer is always removed and the hard layer below polished. The beautiful pearl, so largely used for ornament, the name of which is synonymous with purity, is the produce of various species of molluscs. The nacre is secreted by a part of the mollusc known as the mantle, and a pearl is the result of the nacreous matter being secreted by the mantle around some nucleus lying loose in the body of the shell, gene-

MOLLUSCA.

rally a grain of sand or some loose particle of nacre. The largest pearls are obtained near Ceylon, in the Persian Gulf, and on the coast of Arabia, from the pearl oyster, the *Avicula margaritifera*, in eastern seas, and the *Unio margaritifera* of Britain. The shells are opened and the pearls picked out and the shells are used for their nacre which is called mother o'pearl, almost as valuable as the pearl being, with that of the *Haliotis splendens*, extensively employed in ornamenting papier-mache work.

Cameo ornaments are obtained by carving shells; they are used as brooches, pins, bracelets, &c., and the most beautiful are cut on a large species of *Cassia*, (*C. rufa* known as the Bulls-mouth and found in the Mediterranean; but any shell can be made into a Cameo, the term meaning any small carving on a solid purpose. The window shell, *Placuna placenta*, is at present living in the China sea, but is found fossil, in great abundance, all around the coasts of India from Sind to Singapore and in the peninsula of India and China is largely used as a substitute for window glass. The mussel, the oyster, the which are largely used as food and the fibres of the *Pinna* shell, the substance by which molluscs attach themselves to rocks, is woven into a cloth. The great *Tridacna* shell, *Tr. gigas*, found in the Archipelago and S. Pacific ocean, is a marvel to behold,—a pair of them weighing lbs. 500 and the animal within lbs. 20. The cowrie shell, *Cypræa moneta*, is largely used as a money in Africa, Arabia, the South of Persia, British India and the Archipelago, and also used to ornament saddlery and harness. The famous Tyrian purple is said to have been obtained from a whelk on the shores of the Mediterranean. The chank shell of the Indian ocean and Bay of Bengal, *Turbinella pyrum*, was long the war trumpet of the hindoo races, is seen represented in the hand of their deity, Vishnu and other of their gods, is still used as a trumpet and is cut into armlets and anklets, often of several hundred rupees of value. More than 300,000 of these shells are annually exported from Ceylon. The veneration paid all over India to the large chanks, especially those with the spiral line and mouth turned to the left, is great and reminds us of the music of Triton. They are cut into necklaces called *Krantha* and are used for beetling fine cloths. Other shells, species of the genera *Trochus* and *Plasimella* are used as beads. The beautiful paper Nautilus, *Argonauta argo*, is admired by all who see it for its graceful form, delicate structure and pure colour. The cuttle fish, of the genera *Loligopsis* and *Sepia*, has

MOLLUSCA.

no outer shell, but instead, it carries in the skin of its back a hard oval mass called cuttle fish bone which, throughout the E. Indies, is largely used by painters as a polishing material. The cuttle fish has also a pouch of bag, which is filled with a dark coloured substance, hence called the ink bag; the liquid is poured out and manufactured into the dark pigment used by artists under the name of *Sepia*. Besides the whelks, the oysters, and the mussel scallop, *Pecten maximus* are served up broiled; also the razor fish, (*Solen maximus*), the cockle (*Cardium edule*) the limpet (*patella vulgaris*) the jelly fish, the cuttle fish are all eaten.

Dr. William Trill writes regarding the shells of Singapore that they are found in the sea, in fresh water, and on the land; that the sea shells are most numerous, the fresh water shells are few, as there are no natural sheets of water. A considerable number which are commonly described as inhabiting fresh, are found there in brackish water, and several of them in places that are overflowed by the sea at high tides; indeed the only kind found exclusively in fresh water is a species of *Planorbis*. The land shells of Singapore are not more than 23 species. Several kinds of *Helix* and *Cyclostoma* appear to inhabit the depths of the forest, from whence it is almost impossible to procure them, the jungle being, for the most part, guarded by an interwoven mass of brushwood and prickly shrubs; several species have been discovered, only after the ground has been cleared by burning the trees and thus disclosing the half calcined remains of the shells. There is a remarkable paucity of the larger and more gaily coloured shells, though the coast is extensive and varied and is, apparently well adapted to the habits of life of molluscous animals, there are numerous sheltered bays and inlets, with large tracts of level sand, and in other places, shelling rocks clothed in part with a variety of Algae, there are no rocks of a calcareous nature in that neighbourhood and it is difficult to account for the immense extent and rapid growth of the corallines which line the coast for many miles, and in the elegance of their forms and variety of their species, almost vie with the land forests. This description of animal vegetation, if it may be so called, appears also to obtain its nourishment by absorption from the sea water. The poor Malays and Chinese use most kinds of shell fish as food, and search the shores for them with such diligence, that they have caused a dearth of such as are common in less frequented parts of the coast. Among the group of small islands 30 or 40 miles south of Sin-

MOLLUSCA.

gapore, where a human habitation is rarely seen, the general character of the shells is similar to those of Singapore, but they are more abundant and of larger size, particularly the genera *Hippopus*, *Tridacna*, *Spondylus* and *Chama*, which, especially the two latter, are much used as food by the natives. The *Voluta undulata*, the inhabitant of which is spotted with blotches of bright red on a dark ground, readily catches the eye at a distance of some yards, as it moves like a huge snail through the coral foliage; the *Voluta melo* also inhabits these seas, inferior to the former in the markings of the animal, but more than equal to it in the rich tints of the shells. Numerous molluscs cover the rocks or are firmly attached to branches of coral; in particular a species of *Chama* fantastically branched like coral, and in the brilliancy of its yellow colour more resembling a flower than a shell. In several of the shallow bays, are an abundance of a small species of *Meleagrina* or Mother of Pearl Oyster, few larger than the palm of the hand, and of a dark slate colour. Those accustomed to trade in Mother of Pearl, say that this kind never attains a large size. He was at first inclined to doubt the accuracy of the statement, as not more than two described species, namely, the *M. margaritifera*, and *M. albina* are to be found there. Among the shells of these latitudes, in common with those of all tropical climates, it is rare to find a single species that is identical with any found in the north of Europe, and it is observable that the few such shells, that are found native there, are not of the more common kinds. Of the species found in both latitudes may be mentioned *Chiton marginatus*, *Emarginula fissura*, *Fissurella graeca*, *Arca tetragona*, *Natica castanea*, and a species closely resembling *Trivia europea*. The poorer natives have frequent recourse to shell fish as food, a few kinds however are esteemed delicacies and are frequently exposed for sale in the market, of these may be enumerated *Arca granosa*, (the shell of which somewhat resembles the common cockle) *Corbicula regia* or *Cyrena* of Lamarck, *Cerithium lineolatum* of Gray, and *Voluta melo*, though the latter is not always procurable. Among the eatable molluscs the oyster must not be omitted, though it is for the most part lightly esteemed by the natives, who generally prefer such kinds as have stronger taste. A variety of oysters may be found here but all are not eatable, two species in particular are of considerable size, and excellent flavour, though found in very different localities. The one kind is

MOLLUSCA.

abundant at Pedro Branca, a large rock at the entrance to the China Seas, where they are exposed to rapid currents and stormy waves; here they are invariably found strongly adherent to the rock by the surface of the lower valve. The other kind is procured from the mouth of the Moar river, between Malacca and Singapore. These being comparatively safe from the effects of storms and currents are never fixed to rocks but lie loose in the mud, in beds of considerable extent. Although oysters are so numerous in both these places, it is rare to find any other species of shell in their immediate vicinity, a circumstance that has been remarked of oyster beds in England and other places. Many of a species of *Nassa* are common there, found in the mud of salt swamps: it is in colour a dark brown or black, about an inch and a half in length, the outer whorl is smooth, those next the apex of the spire are furrowed longitudinally, and it possesses the usual generic mark of a prominent plait at the upper part of the aperture. In the same localities may be found another shell quite similar to the other in form and colour but not more than half its length, possessing however all the marks of a full grown shell, and as no shells of intermediate size are to be met with, there seems good reason to believe them two distinct species. At Malacca is a species of *Nassa* of a pale flesh colour barred with brown, about a third of an inch in length, and little more than a grain in weight. In the same neighbourhood he met with another specimen, three quarters of an inch in length, and weighing between four and five grains. As in the former case, the two shells were exactly similar in shape and colour, though very different in size and weight. Several kinds of *Nassa* are particularly abundant in the neighbourhood of the fish markets, where they may be seen in numbers feeding on dead fish and other animal food. This artificial mode of subsistence is possibly one cause of their variable form and size, as it is well known that domestic animals, and others that are more or less dependent on man for their support, are very apt to produce a progeny differing more or less from the parent stock. In the neighbourhood of fish markets may also be seen multitudes of dead shells of all sizes, some so minute as to be microscopic, and all tenanted by Paguri or Hermit crabs, as varied in size as the shells they inhabit, and, like the *Nassa*, busily engaged in devouring fragments of dead fish, which is their principal food. The island of Singapore consists of

MOLLUSCA.

a cluster of low undulating hills based on an extensive plain having a uniform level surface, in some places not varying above two or three feet, in an area of several square miles. The whole of this valley ground is but little raised above the level of the sea, as is shewn by the salt water penetrating for miles into the interior of the island, and in spring tides, even overflowing cultivated fields. Over some parts of this low ground there is a layer of decomposed vegetable matter of variable depth, but for the most part the surface is sand, beneath which, at depths varying from 5 to 50 feet, there is a dark blue plastic clay abounding in shells, and these not of the kinds found in mangrove swamps, but such as are common in open sandy bays or straits. They are not different from those found in the adjacent seas; the forms of most of them are perfect, and in a few the colour is preserved, but they have for the most part lost their hardness, being readily crushed between the fingers. The kinds most abundant are *Placenta placenta*, *Strombus incisus*, *S. labiosus*, several species of *Nassa*, *Columbella*, *Trochus*, *Cerithium*, *Mitra*, *Turritella*, *Dentalium*, *Aspergillum*, *Arca*, *Venus*, *Corbula*, *Tellina* and others. Wherever excavations are made in the low ground of Singapore, similar appearances present themselves: in all the brick pits the clay is of the same description and also contains shells, in the Kallang valley, corals similar to existing species are to be found at the depth of six feet; add to this the fact that the growth of coral is early diminishing the depth of water in the neighbourhood, a good example of which is seen at the entrance to New Harbour where there is a small peaked island, between which and Singapore the coral has grown so rapidly that it is thought the island will in a very few years form a part of Singapore; taking therefore all these circumstances into consideration the existence of shells in such situation may be rationally accounted for on the supposition that most of the valley ground of Singapore was originally sea, and has been altered and adapted to the use of man, chiefly, if not solely through the agency of coral. The *Magilus antiquus* has lately been found north of Penang in the neighbourhood of Junk Ceylon, the natives set some value on them, and occasionally wear them as ornaments; the shell is singular and apt to be mistaken for a petrification, being dense in structure, diaphanous, and much like alabaster. It has been often figured and described by naturalists, but the animal inhabiting it is supposed to be a Gas-

MOLLUSCA.

teropod, though this is rather doubtful, as the shell is said to be generally found imbedded in coral or madrepora. Among other interesting discoveries lately made on that part of the coast, is a layer or stratum of grey limestone, of considerable extent, composed almost entirely of petrified shells. One specimen contains three distinct species, apparently fresh. Of the numerous class of shells inhabiting the interior of madreporas, wood, and stone, there is a species allied to "*Pholas*" which seems to answer the description of the genus *Jouannetia* of M. DesMoulin in a work entitled "*Manuel des Mollusques par M. Lander Range*" the shell is white, rather less than a musket ball, and nearly as globular in form, with a slight coniform appendage at one end, striated obliquely, and having accessory pieces, the consistence of the shell more resembles that of the bivalve of the "*Teredo*" than a *Pholas* and M. DesMoulin considers it to hold a place between these two genera. The specimens met with were in the interior of rolled masses of "*madrepore*" and were evidently old, and none contained the animal alive or dead. The "*Lima*" or the "*file shell*" of which several species are found in the Straits, much resembles the genus "*Pecten*" or "*scallop shell*" which is well known to possess greater power of locomotion than most bivalves. This power is possessed even in a greater degree by the *Lima*. When in the water its movements are graceful, the two valves being used as fins by means of which it swims with considerable rapidity guiding itself by its numerous tentacula which are frequently of an orange colour and arranged not unlike the petals of a flower, the shell is less curved than the scallop, and generally white, the valves do not entirely close.

The *Parnaphora* or Ducksbill Limpet is found there, though by no means a common shell, it is like a *Patella* flattened and elongated, the anterior edge always widely notched, apex slightly recurved, length from one to two inches, colour white; the body of the animal is much more bulky than the shell, and the mantle is so capacious that it covers the whole shell except the apex, which enables it in some degree to elude search, as it appears more like a pulpy or spongy mass than a shell; when touched, the mantle stains the hand a dark purple colour.

A species of *Planorbis* or shell allied to *Planorbis* is found there in pools of fresh water, being the only species of Singapore shell that is found solely in fresh water; the outer whorl is little more than a quarter

MOLLUSCA.

of an inch in diameter; the aperture of the shell more diagonal than is usual in *Planorbis* so that when the animal moves on a plain surface the convex side of the shell is always uppermost whereas the animal of *Planorbis* is described as carrying its shell erect or with the diameter perpendicular; colour of shell pale amber, no operculum, animal nearly black, mouth vertically cleft, no perceptible neck (in the animal of *Planorbis*, the neck is said to be elongated) eyes at the base of two blunt tentacula in which also it differs from *Planorbis* which is commonly described and figured as having two subulate tentacula: the animal possesses in a considerable degree, the power of gliding through the water, apparently in search of food, with its shell entirely submerged and its smooth foot in close opposition with the surface of the water, locomotion being effected, by causing the flat part of the shell to act on the water in the manner of a fin, the head of the animal being at the same time, directed forward so as to regulate its movements; the animal does not occupy so much as half the shell, and the remaining space frequently contains air, which the inhabitant has the power of expelling at pleasure.

Of the genus "*Natica*" there are several elegant species in Singapore, it is known from the "*Nerita*" or "hoof-shell" by being umbilicated, more rounded in form, and the interior not toothed, the shell has been also described as having no epidermis; to this rule however, there are marked exceptions, two of the species native there, having a strongly adherent epidermis.

In Swainson's *Malachology* a species is figured as an extraordinary animal, much larger than the shell it is supposed to inhabit, one of the species found here presents the same appearance in a remarkable degree; and the cause of the phenomenon is that the interior of the foot of the animal is a loose cellular texture, which it has the power of distending with water so as to be more than three times the bulk of the shell, but on the approach of danger it can instantly reject the water, resume its natural size, and retreat into its shell closing after it the operculum which being of stony hardness, secures it from the attack of ordinary foes. This mechanism doubtless assists the progress of the animal through sand in which it frequently burrows.

There are two shells of the genus *Cerithium*. In *C. lineolatum* the shell is about an inch and a half in length, thin and fragile, of a brown colour, with obscure transverse bands of a lighter hue, aper-

MOLLUSCA.

ture more rounded than is usual in the genus *Cerithium*, spire always truncated in the full grown shell, head and anterior part of the animal bright red like coral: the other species observed in Singapore, has rather a larger shell, thinner and more fragile than the other and of a darker colour, the animal is brown or nearly black and like the former, the spire of the full grown shell is always decollated; young specimens of the shell have perfect, sharp pointed spires, and the convoluted extremity of the animal then entirely fills the spiral part of the shell, but as the animal increases in size, its posterior extremity becomes more blunted and gradually retreats towards the anterior part of the shell, and as it successively abandons each turn of the spire, it throws out a viscid secretion which forms a hard shelly partition between its new situation and the disused extremity of the spire, which being deprived of its usual nourishment, soon becomes worn into holes and finally drops off: thus the shell when arrived at maturity has always the appearance of being imperfect. The habits of the animal are mixed and peculiar; sometimes it may be seen in a half torpid state, the operculum firmly closed suspended by a glistening thread, from the branch of a tree; when in motion it leaves behind it, a shining track like that of a snail; at the sides of an elongated proboscis are two tentacula, apparently short, blunt, and with eyes at their extremities: as the genus *Cerithium* is described as having the eyes at the base of the tentacula, this would appear a very remarkable deviation. and Dr. Traill was disposed to consider it as such until he had an opportunity of remarking the movements of the animal in water, where it is as often found as on land. When closely observed in that element, it is seen to expand two slender, pointed, tentacula of so delicate a structure that when out of the water they are lax, flaccid, and doubled under the protuberant eye, so as to be almost invisible. The shell has been found in running streams but more commonly in the brackish water of canals or ditches.

Of the very numerous species of the genus *Cypræa*, or Cowry shell, the largest found here is the "*Cypræa tigris*" which is prettily spotted with black, it is frequently made into snuff boxes in England. The mantle is so large as to cover all the shell, on the back of which there is often a longitudinal line which marks where its two folds meet: this membrane continually secretes an abundance of viscid fluid which lubricates the shell, and preserves the beautiful polish which has procured for them the name of porcelain shells.

MOLLUSCA.

"*Cypræa olivacea*" is the most abundant of the Singapore cowries being found on most beaches under flat stones, it is of the size and much the colour of an olive except that the back is generally mottled with brown and the mouth somewhat yellow; the specimen which he found with the young attached, was fixed in the usual manner, to the lower surface of a stone; on raising it there was found adhering to it, a flat circular membrane broader than the shell, transparent, and dotted with minute grey spots like grains of sand, on placing the mollusc in a glass of sea water, numbers of grains dropped out of the membranous mass to the bottom of the glass and immediately assumed rapid and lively movements, some revolving in a rotatory manner, others alternately rising and sinking in the water or sporting over its surface. On a closer examination these grains were seen to be in reality shells, some hundreds in number, nearly transparent, having no perceptible columella and apparently consisting of a single coil or whorl, aperture round, breadth of the shell greater than the length, so that, when on a plain surface it rested on either end like a *Planorbis* or *Nautilus*, the animal effected these rapid movements by the alternate contraction and expansion of its foot which was broad and expanded and much larger than the shell, into which it seemed to have no power of withdrawing it.

Another cowry is occasionally found on the coast, resembling in colour the *C. adusta*, but not more than half the size and less cylindrical in shape: one was fished up in "ten fathom" water near Sultan's Shoal to the westward of Singapore, partially imbedded in a species of sponge, on detaching it from which, the cavity of the spongy mass was found lined with the young fry of the *Cypræa*, differing however in several respects from that of the *C. olivacea*:—instead of being contained in one membranaceous envelope there were about two hundred transparent sacs not larger than grains of mustard seed and each containing about 30 shells so minute that they could not be distinguished without the aid of a microscope, at a moderate computation there could not have been less than six thousand young shells: the difference in size is remarkable, as the *Cypræa olivacea* which had the largest offspring is a much smaller shell than the one at present under consideration: the animals were dead, having been many hours out of the water; when examined under a microscope the shape of the shell was found to resemble exactly that of the young *C. olivacea* above described.

MOLUCCAS.

On various parts of the coast, particularly on coral banks, a considerable number of *Echini* may be observed, which (although Naturalists have separated them from the testaceous mollusca) it may not be out of place to mention; in one species not hitherto described the shell is spheroidal, flattened, not more than two inches in diameter and of a dark purple colour, the species are numerous, six or eight inches long, black, very slender and sharp pointed and somewhat elastic; the animal is found along the edges of coral reefs, and moves with tolerable rapidity by means of its spines, when closely pursued it has the faculty of darting itself forward against its opponent and thereby inflicting considerable injury with its sharp spines, the points of which often break off and remain in the wound.

The poor of India use as food *Cyclas*, *Cerithium*, two species; *Nerita*, *Corbicula*, one species found within tidal influence, and two others in fresh water.

Velorita cyprinoides (Gray) of the family *Cyrenidæ*. *Unio*. *Limnea stagnalis*. *Ampullaria glauca* *L.* *Planorbis indicus*. *P. Coromandelina*. *Paludina bengalensis*.

Bornella digitata Adams, is a nudibranch or marine slug, which occurs in the tropical seas in the south of Asia at Aden, in the Straits of Sunda, and on the Madras coast. It has brilliant colours, with vermilion streaks and is delicately marbled and has waving elegant tufts. It swims by a lateral movement of the body.

Amussium Japonicum is a large scallop of Japan. The Japanese call it *Tsuki-hi-kai* and the Sun and Moon shell, from its presenting a yellow disc on one side and a white one on the other.—*Balfour Catalogue of the Government Central Museum Madras*, Dr. Lankester uses of animals, Dr. Traill in *Journal Indian Archipelago*, Woodward, *Recent and Fossil shells*, Dr. Culbert Collingwood, M. A. M. B., *Rambles of a Naturalist*, London, 1868.

MOLOCH, a name of Baal. See *Infanticide*: *Sacrifice*.

MOLOSSUS CHEIROPUS. See *Chiroptera*.

MOLOSSUS TIBETANUS, The Tibetan mastiffs, fierce-looking animals.

MOLUCCAS, also styled the *Spice Islands*. The whole of the numerous islands between Celebes and Papua are geographically called the Moluccas, although politically this name is restricted to the Dutch Spice Islands, Banda, Amboyna, Ceram, Batchain, Tidore, and Ternate. The Moluccas, properly so called, form two groups, composed of numerous islands assigned by geography to the

MOLUCCAS.

fourth and fifth ranks, though in history they occupy, from their commercial and political importance, a place equally prominent with Java and Sumatra. Of them, as of the Philippines, it is to be observed, that their origin is volcanic. Although Ternate was in ancient times the capital of the Spice Group, Amboyna, or the Isle of Dew, is politically the chief, and has always been valued by the Dutch among the most important of their possessions, the crown and key of the Moluccas. It belongs in size to the fifth rank, although it has been assigned to the fourth. The area of the island is calculated at little more than thirteen geographical leagues, its population at nearly fifty thousand. Viewed from the sea Amboyna presents its elevated surface to the eye, diversified by many varieties of outline. The nutmeg, produced in perfection nowhere in the world out of this, the third division of the Indian Archipelago, is found; but it is for the clove that the island is celebrated; and that rich possession has been to it a curse, as the gold of Mexico and Peru was to the original tenants of those countries. It brought upon the people cruel and selfish masters, who drenched the soil in blood that the natives might be forced to lend their labour to the service of a monopoly, first claimed by the Portuguese but followed by the Dutch. About three hundred thousand pounds are annually produced. The culture and collection of the spice employs almost all the population, and exhibits a curious social picture, from the planting of the young trees to the drying and packing rooms, in which, according to a credulous and quaint cosmographer of the sixteenth century, a pail of water would dry up in two days, from the excessive heat of the cloves.

In the Moluccas are three large islands, Gilolo, Ceram and Bourn, with many small isles and islets, Batchian, Morty, Obi, Ke, Timor-laut, Amboyna, Ternate, Tidore, Kaia and Banda. The Moluccas include five islands off the W. coast of Gilolo, and Bourn, Amboyna, and other islands are off the S. coast of Ceram. The three large islands are Gilolo, Ceram and Bourn with a great number of smaller ones, amongst others Batchian, Morty, Obi, Ke, Timor—Laut, Amboyna, Ternate, Tidore, Kaia and Banda. These occupy a space of ten degrees of latitude by eight of longitude, and by groups of small islands they are connected to N. Guinea on the East, the Philippines on the North, Celebes on the West and Timor on the South. The land mammals are few in number. There are 25 bats but only 10 land mammals are known in

MOLUCCAS.

the group, amongst them *Cynopithecus nigrescens*, *Viverra zangalunga*, *Rusa hippelaphus*, *var* the *Babirusa*, *Sorex myosurus*, common to Sumatra, Borneo and Java, and four marsupials, viz., the small flying opossum, *Belideus ariel*, a beautiful little animal resembling the flying squirrel in appearance and three species of *Cuscus*, peculiar to the Austro-Malayan region,—opossum like animals with a long prehensile tail, of which the terminal half is generally bare, they have small heads, large eyes, and a dense covering of woolly fur, often pure white with irregular black spots or blotches, but sometimes ashy brown, their flesh is everywhere eaten. They live in trees and feed on the leaves, of which they devour large quantities; they are very tenacious of life. There are, however, 265 species of birds known amongst them; the large red crested cockatoo, two species of the *Electus* parrot, and five of the beautiful crimson lorries, 21 species of pigeons, 16 species of kingfishers and the mound making *Megapodius Wallacei* inhabits Gilolo. Ternate and Bourn. The Moluccas or Spice islands, next to Java, are the most important of the Dutch possessions in India. The islands Amboyna, Banda, Ternate, Tidore and the smaller islands in the neighbourhood, form a sub-government of Java. The greatest part of these islands were discovered by the Portuguese who were in possession of them at the commencement of the 16th century, but they were taken by the Dutch at the close of that era. The monstrous policy of this nation led them, at one time, to root up and destroy, at a great cost, often by force of arms, all nutmeg and clove trees except the number necessary to produce the quantity of spices which it could sell, and so preserve the monopoly. The islands are small, volcanic, unproductive in grain, but fertile in fine spices.

Rosingain, near Banda, was almost abandoned after the extirpation of its spice trees, its people emigrating to the neighbouring islands in search of a livelihood. The people are of the Malayan race, short, squat, and darker in complexion than the Malays or Javanese.

The Amboiannes are of a middling height and well formed. They make good mounted and foot soldiers. They are gentle, brave, very sober and easily managed. A considerable number have embraced Christianity. Their costume is nearly the same as the Malays of Java. The average annual crop of cloves is from 250,000 to 300,000 lbs. The clove tree begins to bear at 15 years and is in full perfection at 20, and the average yield is 5 lbs, though a tree has been

MOLUCCAS.

known to yield 25 lbs. It attains a height of 35 to 40 feet.

Banda residency comprises several islands, of which are Banda or Banda Neera, Gunong Api, so named from its terrible volcano; Lonthoir, Rosingain almost abandoned after the extirpation of its spices, Pulu-Ai, and Pinang. Banda is very unhealthy and is subject to frightful earthquakes: many of the people are christians. When first discovered by Europeans, the inhabitants had made considerable advance in civilization; but one still much inferior to that of the Malays and Javanese. Sir Stamford Raffles has furnished specimens of three of the languages of this furthest group of islands. The Banda cluster are the most southern of the Spice Islands, and are twelve in number, each only a few miles in extent and all lying near each other. These are lofty volcanic isles, one of them constantly vomiting forth smoke or flame; and all possessing a rich black soil, luxuriantly clothed with trees, chiefly the nutmeg tree which resembles a large pear tree but with a laurel-shaped leaf.

The crescent shaped island of Loutar is the largest.

The area of the whole group is only 176 geographical square miles, but in five of them, nearly all the nutmegs consumed in the world are grown, and for the last 20 years, they have annually yielded lbs. 589,000 of nutmeg and lbs. 137,000 of mace, Dutch weight.

The islands are high, liable to sudden gusts of wind. There is an anchorage in lat. $4^{\circ} 31' S$ and long. $130^{\circ} 0' E$. at the foot of Gunong Api.

Amongst the Molucca islands, Banda is the chief nutmeg group. The nutmeg with the equally prized mace, the excellent maritime position, the superb roadstead, and the fertile soil of Banda, render it conspicuous among the Spice Islands: but, unlike Amboyna it is unhealthy, and exposed to constant danger from the Gunong Api volcano, which has many times burst in magnificent eruption, devastating the neighbouring region, and blasting it with showers of scorching ashes. The three islands, Banda Neera, Nuthoir, and Gunong Api, form a roadstead sheltered from every wind, but the Gunong Api, or Fire Mountain, is the curse of the group, not only when in eruption, but on account of the insalubrity it spreads around. The base of this volcano, called by the French the Grenade of Banda, occupies the whole surface of the islet to which it gives a name. Its height is about 2,000 feet, covered with magnificent vegetation, commenc-

MOLUCCAS.

ing at the line where the waves cease to beat, and continuing upwards to the point where the lava ceases to flow, on being cooled by the air.

But the nutmeg is not cultivated on Gunong Api and the isle is inhabited only by a few emigrants from Timor.

Gilolo, is one of the Molucca Islands. Its north end is in about lat. $2^{\circ} 23' N$. It has a long mountainous coast, high bold land, with three remarkable peaks. The indigenes live in the north of the island. They are radically distinct from all the Malay race. Their stature, their features, as well as their dispositions and habits are almost the same as those of the Papuan. Their hair is semi-Papuan, neither straight, smooth and glossy like all true Malays, nor so frizzly and woolly as the perfect Papuan type, but always crisp, waved and rough, such as often occurs among the true Papuans but never among the Malays. Their colour alone is often exactly that of the Malay, or even lighter. Of course there has been intermixture and individuals are occasionally seen whom it is difficult to classify, but in most cases, the large, somewhat aquiline, nose with elongated apex, the tall stature, the waved hair, bearded face, and hairy body, as well as the less reserved manner and louder voice unmistakably proclaim the Papuan type. Here is the exact boundary between the Malay and Papuan race. It is only in the northern peninsula that these Papuan indigenes exist, the whole of the rest of the island with Batchian and the other islands westward being exclusively inhabited by Malay tribes like those of Ternate and Tidore. This would seem to indicate that the Alfura are a comparatively recent immigration and that they have come from the north or east, perhaps from some of the islands of the Pacific, though it is difficult to understand why so many fertile islands should possess no indigenes. The Galela race are natives of a district in the extreme north of Gilolo, but they are great wanderers over the Archipelago. They are a very fine race, remarkably energetic and industrious, of light complexion, tall and with Papuan features, coming near to the drawings and descriptions of the true Polynesians of Tahiti and Owyhee. They build large and roomy prahu with outriggers, and settle on any coast or island they take a fancy for. They catch turtle and tripang, hunt deer and wild pigs and dry the meat, and cut down the forest and plant rice or maize. The people of Gilolo are called Alfura, and Professor Bikmore, however, states they are strictly of the Malay type, and have not the dark skin and frizzly hair of the Alfura of Ceram and

MOLUCCAS.

Burn, though representatives of that people may exist in Gilolo. The population of Gilolo are supposed to be 75,000 all but 5,000 of whom are under the sultan of Ternate.

The clove tree grows spontaneously on Ternate, Tidore, Motir, Makian, and Bachian. The northern peninsula of Gilolo, and the great island of Ceram is inhabited by the Alfuros of Sahoo and Galela. These people are quite distinct from the Malays and almost equally so from the Papuans. They are tall and well made, with Papuan features and curly hair. They are bearded and hairy limbed, but they are quite as light in colour as the Malays. They are an industrious and enterprising race. Cultivating rice and vegetables and indefatigable in their search after game, fish, tripong, pearls, and tortoise shell.

Tidore, on the west coast of Gilolo, is about 6 miles long. A mountain on the N. E. end of the island, is in lat. $0^{\circ} 40'$ N. long., $127^{\circ} 22\frac{1}{2}'$ E. Tidore is over 4000 feet high. Tidore, like Ternate,—from which it is two or three leagues distant—is formed in its southern part of lofty hills. The soil is of great fecundity, and plentifully watered by streams from the peaks. The people appreciate these blessings, and labour more earnestly on the land than those of the sister isle, distinguishing themselves by an aptitude for agricultural occupation. Near is Batchian, the largest of the chaplet of isles surrounding Gilolo, fertile as Tidore, but neglected and rotting in its wealth and beauty, under the hands of a population universally indolent. The soil is volcanic, and below the active crater springs of sulphureous water break from the ground in the most picturesque situations. Among the people here, as in Amboyna, the christian converts are the most inert and servile. The situation and aspect of the island are beautiful, its fertility is abundant, its climate leaves little to desire, yet is all but a waste, with a scant and scattered population immersed in poverty. Monkeys are to be found nowhere else in the Molucca Archipelago. The Molucca sea is sprinkled with smaller islands interesting and curious in themselves, but too little important, and too numerous to be separately noticed. Among them, however, may be enumerated Tawali, Mandola, Lutia, Hanika, Saparua, Ghissa, the Keffing Isles, Amblow, Manifra, Kilang, Bono, Harekoe, Hominoe, Noesa Laut, Hila, Kilwari, Binoe, Nelany, Manipa, Manok, Myo, Tesory, Serua, Motir, Bally, Tomoguy, Selang, Gag, and Battang Pally. There is considerable variety in their aspect, form, and size. Some, like Battang Pally, are not half a mile round, though

MOLUCCAS.

bearing a grove of trees. Others, considerably larger, are of moderate elevation, and wooded over their whole extent. Pulo Gag, unlike most of its companions, presents an English appearance, being luxuriantly fertile, but with the exception of a few tall timber clumps, entirely bare of trees. Many are wholly uninhabited. The greater and the lesser Keffing, however, now little known islets, S. E. of Ceram, are well peopled by mohammedan Malays, and sprinkled with houses of traders engaged in traffic with the Nassau, the Ki, and the Tonimber Isles, where they sell the produce of their fishery, tortoise, and trepong. The isles are low, but remarkably picturesque.

Bonro island is one of the Moluccas, Fort Defence, being in lat. $3^{\circ} 22\frac{3}{4}'$ S. Long. $127^{\circ} 4'$ E. in lat. $3^{\circ} 6'$ S. Long. $125^{\circ} 57'$ E. is about two hundred miles in circumference. The island is high and has a semi-circular mountain on its N. W. part. Bonro has two races, the larger number are Malays of the Celebes type, often exactly similar to the Tomore people of East Celebes, who are settled in Batchian, but the other race resemble the Alfura of Ceram. The bulk of the inhabitants are a comparatively fair people, very closely resembling the native of Amboyna.

The cluster of islets lying at the South-east extremity of the large island of Ceram as it is called by the natives, or Ceram as it is laid down in the maps are known as Ceram. They are situated in latitude $30^{\circ} 55'$ south, and in L. 133° E. and form one of the most remote trading stations to the eastward, from which the produce of the Archipelago is conveyed in native vessels to this port. The Island of Ceram is the second in size of the Moluccas, having an estimated area of about 10,000 square miles. The mountains are from six to eight thousand feet in height, sending down innumerable streams to the sea. The vegetation is every where luxuriant, and the trees gigantic. Admiral Keppel had in his possession a circular slab of wood from the island, three and a half inch thick, eight and a half in diameter. The sago palm in particular is more abundant and productive, than on any of the adjoining islands. Cloves and nutmegs grow wild. The names of the several islets which compose the Ceram group are Seranreh, Gesir, Kaliwaroo, Gorong, Manokoo, and Malomgee. Of these, the two largest are Gorong and Manakoo, and are the only ones of the group which exhibit any appearance of fertility: they are represented to be hilly and covered with wood, except where cleared for the purpose of cultivation, which however seems confined to the little

MOLUCCAS.

rice which is grown on them. They produce fruit trees in considerable abundance, and among them the durian and mongosteen, as also the wild nutmeg, the cocoanut and sago palm, the latter supplying to the natives the chief article of subsistence. Ceram has on its western side the three islands Bonoa, Kelang and Manipa. The commercial products from these islands consist of tortoise-shell, mother o'pearl shell, becho de mer, wild cinnamon wild nutmegs, and birds of paradise.

Ceram is the largest island of the Moluccas; and, next to Celebes, of all its Archipelago. It is 162 miles long, but its greatest breadth is only 42 miles. The island is one long mountain chain that sets off transverse spurs, and some of the peaks are 5,000 or 6,000 feet in height. The people of Ceram approach nearer to the Papuan type than those of Gilolo. They are darker in colour, and a number of them have the frizzly Papuan hair; their features are harsh and prominent, and the women are far less engaging than those of the Malay race. The Papua or Alfuro man of Ceram gathers his frizzly hair into a flat circular knot over the left temple, and places cylinders of wood, as thick as one's fingers and coloured red at the ends in the lobes of the ears. They are very nearly in a state of nature, and go almost naked, but armlets and anklets of woven grass or of silver, with necklaces of beads or small fruits, complete their attire. The women have similar ornaments, but wear their hair loose. All are tall, with a dark brown skin, and well marked Papuan physiognomy. The Alfuro of Papuan race are the predominant type in the island of Ceram. Of twenty-eight words of the language of Ceram, nine of the words are Malay, two Javanese, and seventeen are common to these two languages. The natives themselves, however, of the Ceram laut islands have never visited this port, the trade to it from thence being exclusively carried on by the Bugis, the Phœnicians of the Eastern Archipelago, of whom a few are settled on the island, while others resort there as a trading station.

Ceram is about 185 miles long by about 30, broad and is traversed from east to west by a mountain range.

Butchian is about 52 miles long by 20, and is separated from Gilolo only by a narrow strait.

Tidore and Ternate are two small isles, each dominated by a cloud-capped peak.

Anboyna is about 32 miles long by 10 in breadth, and its volcanic soil is so rich in the finer woods, that a Dutch botanist presented to a duke of Tuscany a cabinet inlaid

MOLUCCAS.

with 400 specimens, all of which he had obtained in the island. The most distinguished of these is the clove, about the size of the nutmeg tree.

Westward of the Moluccas is Celebes, an island resembling Gilolo in grotesqueness of form, about 500 miles in length by 100 in breadth. In Celebes, the Trans-Javan or Timorian baud, and the Moluccas, is a large and important class of Indonesians, who graduate between the Anam type, the Burman and the Negrito. The most prevalent head or that of the predominant race is ovoid, but it is somewhat Burman in nose, eye and colour. The great island of Celebes may be considered the centre of a group of languages, which, although agreeing with those heretofore described, in simplicity of grammatical structure, differs very widely from them in phonetic character although spoken by the same race of men. Celebes is intersected by the equator, leaving a small portion of it in the northern and the mass in the southern hemisphere. Its greatest length is about 500 miles, but its greatest breadth does not exceed 100; and in some places it is hardly one-third of this width. Celebes may be considered to be the focus of an original and independent civilization which probably sprung up amongst the most advanced of the nations which occupy it, called by themselves Wngi, and by the Malays, and after them by Europeans, Bugi or in the plural Bugis. In material civilization the Bugi are equal to the Malay. Of the language of Celebes, the next in importance to the Bugi, is the Macassar. The people who speak this tongue inhabit the same peninsula. They call themselves and their language Mankasara, and hence the Makasar or Mankasar, of the Malays, whence the European name Macassar. Besides Bugi and Macassar, the two principal languages, there are three other languages of Celebes written in the same character, or, at least, occasionally written in it; the Mandar, the Manado, and the Gorongtala. The Mandar is spoken by a people on that side of the South-western peninsula, which fronts Borneo.

The island of Sumbawa, the third in a direct line east of Java, about three times the extent of Bali or Lombok, and divided by a deep bay into two peninsulas, has three languages, the Sumbawa, the Bima, and the Tambora. The natives of Sumbawa are little inferior in cultivation to the most improved nations of Celebes. The Sumbawa and Bima languages are written in the Bugi character, but there exists in this island a singular and curious obsolete alphabet. It is

MOLUCCAS.

scribed to the Bima nation, but the characters do not generally correspond with the simple sounds of the Bima language as exhibited in the specimen given of it.

The Moluccas exhibit a very singular feature in the exact conical form, with which most of them rise above the horizon to meet the navigator at the distance of 80 or 90 miles. In other cases he is glad to have the flying contour of a landscape to guide him in the recognition of the coast and headlands, but there is something so peculiar in the aspect of these islands, that he feels confident he never can mistake them. The extirpation by the Dutch of the spice trees in the Moluccas is no longer prosecuted, although its effects are of course still felt. The monopoly of the spices is continued, but the system now pursued is not so oppressive to the natives.

The Spice Islands in the Molucca and Banda seas, consist of many islands and numerous languages. Next to Java of which they form a sub-government, the Moluccas are the most important of the Dutch possessions in India. The chief islands to which this term is applied are Amboyna, Banda, Ternate, Tidore with smaller islands in their neighbourhood. The islands are small, volcanic, unproductive in grain, but fertile in fine spices. But the ruinous policy of the Dutch nation in their greed to secure a monopoly of this class of products, led them for years, to root up and destroy, at a great cost, often by force of arms, every nutmeg or clove tree not required for the production of that quantity of spices which they calculated they could dispose of. Rosinain, near Banda, was almost abandoned after the extirpation of its spice trees, its people emigrating to the neighbouring islands in search of a livelihood. The people are of the Malayan race, short, squab and darker in complexion than the Malays or Javanese. The Amboynese are of a middling height and well formed. They are gentle, very sober, brave, easily managed, and make good mounted and foot soldiers and a considerable number of them have embraced christianity. Banda is very unhealthy, and is subject to frightful earthquakes. When first discovered by Europeans, the inhabitants had made considerable advance in civilization, but one still much inferior to that of the Malays and Javanese. Sir Stamford Raffles has furnished specimens of three of the languages of this furthest east portion, viz: those of Ceram, correctly Serang, of Ternate, correctly Tarnati, and of Saparuwa, one of the Banda isles. Of the language of Ceram, nine of the words are Malay, two Javanese, 17 are common to these two languages. Ceram Laut is the great place to which the Bugi carry

MOLUCCAS.

the Papuan slaves whom they steal from New Guinea.

Timur is a word which means the east, and was probably imposed on this island by the Malays, to whose language it belongs, because this was the extreme limit of their ordinary commercial voyages to the south-east. Timur is about three times the extent of Jamaica. Its principal inhabitants are of the Malayan race, but it contains also Papuans or Negroes, and tribes of the intermediate race. The two languages of Timur are the Manatoto and the Timuri, the first spoken at the north-east end of the island, and the last used by many of the tribes as a common medium of intercourse. No alphabet has ever been invented in Timur; but judging by the specimens of its languages, the vowels are the same as those of the Malay and Javanese.

From Timur to New Guinea, there runs a long chain of islets, forming, as it were, a wall of barrier to the south-eastern portion of the Archipelago. In these islets the inhabitants speak many languages. By far the most ample and authentic account of them has been given by Mr. Winsor Earl, who says that in the south-eastern parts of the Indian Archipelago, where opportunities of social intercourse between the various petty tribes are of rare occurrence, every island, every detached group of villages, has its own peculiar dialect which is often unintelligible, even to the tribes in its immediate neighbourhood. In some of the larger islands, Timor, for example, these tribes are so numerous, and the country occupied by many of them so extensive, that it becomes impossible to form even an approximate estimate of their number. Of one language, the prevailing one among several languages of the island of Kisa, one of the Sarawati group in the chain of islets already mentioned, Mr. Earl furnished a vocabulary of 330 words. The Kisa is an unwritten tongue, but its vowels are the same as those of the Malay and Javanese.—*St. John's Indian Archipelago*, Vol. I, p. 121, 124, Vol. III, p. 220, *Argensilas, History of the Moluccas*; *Tenminck, Possessions Neerlandaises dans l'Inde Archipelagique*, III, 219. *Tenminck, Coup de Œil*, III, 219. 1. 3. *Fr. The English and Portuguese name asphalté is derived from the Lake Asphaltites, but the substance is now found in several countries.

Bitumen is obtained from the Swiss frontier in France, from the Bitumen Lake in Trinidad. It is found on the surface of volcanic productions; floats on the Asphaltic Lake or Dead Sea in Syria, is also found near ancient Babylon; it is supposed that the cement used for the walls of that city as also for the temple of Solomon, was a preparation of asphalté, and Herodotus mentions that it was heated and mixed with reeds and so used; it is supposed also to be the substance translated in the Bible as pitch, and to have been used by Noah to coat or pay the ark and by the mother of Moses to coat the vessel in which he was laid afloat, and it seems to be the substance known in Central Asia and in the north of Persia under the name of Momiai. Where damp has to be resisted, it is useful, it is found impervious to wet, white ants or vermin, and as it does not vegetate,

MOMIAI.

rot or decay, it is superior to wood, or mortar as a flooring material. Dr. Hougberger (p. 238 and 239) says that the Persian Mumiai—is deemed a certain specific in fractured bones, deserving the name of osteocolla. It is a solid, hard, heavy, black, glistening mass without any particular odour. The genuine is but seldom to be met with, even in Persia itself, the place of its origin, for the king of Persia is reported to collect the whole product yearly and to inclose it in small silver boxes, which are distributed as presents to his family and friends. In all Eastern bazaars may be found under the name of Persian Mumiai, a compound resembling the genuine in appearance. According to Dr. Seligmann, Mumi in Persian, signifies wax, Lai or Ajin is the name of the village in the vicinity of which the spring of water containing Mumiai or Mumiain is found. The Mumiai was discovered in the time of Feridun. He also says that the Asphaltum Selajit, Asphaltum Panjabinum or Punjab Asphalt, an official article at Lahore, is brought from the hills. The hakims and hindoo doctors use it instead of the Persian Mumiai in cases occurring from exterior violence. Half way between Behbahan and the river Kurdistan, are the ruins of Arrejan or Arrgan. Near the Straits of Teng-i-Teko, from whence the Kurdistan river issues into the plain, and not far from the village of Peshker, is a fissure high up in the mountains, out of which runs a black substance resembling pitch, which is gathered by the natives and is much esteemed in Persia for its healing qualities, especially for bruises and fractures. It is called Mumia or Mumia-i-Nai from the village Nai-deh at its bottom. Shiraz sustained the shock of an earthquake about the year 1810, when this fissure was enlarged and the Mumia since flows out more copiously. The excessive esteem in which it is held by the Persians may be judged by mentioning that Ali Murad Khan sent about an ounce of Moumai enclosed in a gold box to the empress of Russia. De Guignes alludes to it as the Moumanni or Moumiani blanc: and in the Oriental Geography which was translated by Sir William Ouseley, it is said to be brought from a mountain in the district of Sambeil, near the borders of Pars, and it is alluded to also in the Ajnib-ul-Makhlukat and the Jahan Numa. Baron de Bode surmises that this is the Sarcocolla of Dioscorides iii. 99, which is described as obtained from Persia and to have possessed wonderfully healing properties. It is a hard black substance and when about to be used, is mixed with melted sheep's fat, and

MOMIN.

while hot, the bruised part is well rubbed with it. Sir William Ouseley derives its name from Mom-i-Ayi, the wax of the village of Ayi, and states that the Momai of Darabjird is alone reckoned genuine.

The Shih-lan-yu of the Chinese, said to flow from wells or springs, yellow and liquid, black, but becomes thick and clear like varnish, then a sulphur smelling, penetrating, inflammable substance; it is obtained from several sources. The Shih-ts'ih or stone varnish of the Chinese is obtained in Hankow, Yen-ngan-fu, Shensi, Lichau or Lei chau, Nan-hing-chau in Canton province, places between Burmah and Yunnan, and in the S. E. of So-chu'en; is used externally and internally as a medicine, to burn in lumps, and to lubricate barrow wheels. In China, a kind of naphtha or rock oil, Mang-ho-yu, resembling Rangoon tar is obtained in the Corea by distilling a bituminous shale, and at Tung-shao, near Tam-sui in Formosa, are wells yielding some sorts of paraffin or thick bitumen, differing from the Rangoon and American earth oils. There are oil wells, or fire wells at Kia-ting-fu in Sech'uen, which yield an inflammable gas, and an oily, greenish, combustible petroleum like liquid, containing paraffine. The wells are from five hundred to three thousand feet in depth: also, Tsch-cha-fu, in the S. W. of Shansi furnishes a kind of petroleum or rock oil.—*De Bode, Honigberger*, p. 238-9 *Bingley I*, 150. *Paole's Statistics of Commerce*, p. 14. *Smith Mat. Med. of China*.

MOMA-KHA, ? BURM., *Salix tetrasperma* Roxb. In Amherst, its timber is employed for gun stocks; it is a reddish, softish wood, close and compact, fit for turning purposes, and exempt from attacks of insects.

MOMANO, GUZ. A mohammadan weaver or cultivator in Cutch.

MOMAY. Dr. J. D. Hooker observed in the month of September, that "birds flock to the grass about Momay; Larks, Finches, Warblers, abundance of Sparrows (feeding on the Yak droppings), with occasionally the Hoopoe: Waders, Cormorants, and Wild Ducks, were sometimes seen in the streams, but most of these were migrating south."

MOM-CHIEENA, BENG. *Stillingia sebifera*.

MOMEHA. HIND. ? Resin of *Cannabis sativa* of a kind, finer than charras.

MO-MBIT. See India.

MOMIN, a town 90 miles from Bamo. It seems to be under the Pan-Thay mahomedans. From Momin to Bamo the road runs through Shan and Chinese territory.

MOMIN, in Berar, weavers and sellers of native cloths, the Sarhi, Snsi, Farban, Khodi. They profess mahomedanism.

This vegetable is very commonly cultivated in India and Burmah at the commencement of the rains, the fruit is from ten to fourteen inches long, and from two to four in diameter; the edges are curiously notched and ridged, the flavour is bitter, and it requires to be soaked before being cooked, sometimes used in brewing. The green fruit is used in curries, &c., is known by the name of small snake gourd. In Ajmeer, it is sown at the commencement of the rains, but may be continued during the cold season; it is a bitter fruit, very rough skinned, the edges have a very wrinkled appearance; when ripe it is of a beautiful deep red and yellow. The natives fry and eat them, but they are principally used in curries; they require to be soaked in salt and water before dressing. They sell from one to two pice a seer; act as an anthelmintic.

A variety, *Fructibus oblongis*, with oblong fruit,

Comboo pagulkai,	TAM.	Pandy pavel,	HORT. MAL.
Lamba karalla,	DRK.	Deerga Karavallie,	SANS.
Comboo Kakakain,	TEL.		

is "a very valuable pleasant tasted and wholesome vegetable though perhaps a little too bitter. It is about four or five inches long and of a wrinkled and scabrous appearance outside. The natives sometimes make curry of it, but prefer it fried. In some parts of the country the Tamil name is pronounced Kombu-pawa-kai, another fruit, called Nerree payay-kai, belonging to the Cucurbitaceæ, is sold in the bazaars. *Roxb.*

MOMORDICA MURICATA. *Willd. Syn. of var. of Momordica charantia. Linn.*

MOMUND, an Afghan tribe. The Upper or Hill Momund occupy the hill range between the Panjkora and the Kner rivers, and possess the Kurrapa pass. Two of their kheils are nomadic and in summer move to the head waters of the Helmund. The Upper or Hill Momund country extends from the south-western Swat border to a little beyond the Kabul river. Both banks of this river are in their possession, and their capital, Lalpoora, where the head of their tribe resides, is situated near the left bank. They owe allegiance to the Kabul government, though subject to an almost nominal control; and in the treaty with the Amir Dost Mahomed Khan he undertook to restrain them from hostility against British subjects. Their militia can muster about 12,000 fighting men. They are tolerably good soldiers, though not equal to the men of the most martial tribes. Their hills overhang the fertile strip of British territory, enclosed between the Swat and Kabul rivers near their confluence, known as Doaba, and this portion of the border is not more than 25 miles distant from Peshawur. The

MON.

three sections of the tribe that have come in contact with the British are the Pindee Akee Momund, the Alumzye Momund and the Michnee Momund.

The Michnee Momund, after annexation, were allowed to hold from the British Government, a fief or jagheer in Doaba, the fertile triangle near the junction of the Swat and Cabul rivers, of which they collected the revenue. A portion of the lands they cultivated themselves, the remainder they farmed out to other tribes of the plains as tenants. Many of their clansmen dwelt in the plains of Michnee and some in the neighbouring hills. They traded in the Peshawur valley. The Alumzye Momund, whose headquarters are at Gundao, in the hills, also had a fief of Panjpao in British Doaba, chiefly cultivated by tenants. A few of their men lived in the plains and the majority in the hills. These also traded in the valley. The Pindee Akee Momund, at a former period, had held a similar jagheer in Doaba; but not since British rule. These have few relations either with the Government or the people of the Peshawur valley. They inhabit a very strong locality in the hills. The fiefs were originally granted by preceding Governments to the Momunds as black mail to buy off depredation.

Momunds of the Plains are a section of the Momund tribe who have colonized in the South-Western portion of the Peshawur district. They are now respectable cultivators. They maintain friendly relations with their neighbours, the Afreedee. Their chiefs hold jagheers, but the support they give to government in return is lukewarm. They have not fraternized with their fellow Momunds of the hills; but they have not cordially co-operated against the Afreedees, of whose vengeance they are perhaps apprehensive. See Afghan, Khyber.

MOMUNDPOOR. See Punjab.

MOMYAI, an "osteocolla" or rare medicament; usually the specimens consist of hardened tar or petroleum or even lignite. See Momini.

MON is the native name of the people of Pegu. The Burmese call them Talieng. The Siamese appellation is Ming-mon. Part of this population dwell on the Delta of the Irrawadi, Mon being the name used by themselves, for the native populations of Pegu, Moulmein, and Amherst in Martaban; but their neighbours call them Talieng, and the same names Mon or Talieng are given to the vernacular language of Pegu. The alphabet, like that of the Thai and Burmese, is of Indian origin, being essentially that of the Pali form of speech, and like all alphabets of this kind, it embodies a buddhist literature.

MON.

The Mon language is quite unintelligible to a Burmese or Siamese. The Mon called by the Burmans, Ta-lain, and Peguan or Peguer by Europeans, are the race occupying Pegu. They are an East Himalaic people, who long successfully contested with the Burmans the sway over the basin of the Irawadi. They were annexed to Burma, in the middle of the 16th century, but again threw off the yoke in the beginning of the eighteenth century and subjugated all Burma. Their range embraces the delta of the Sa-luen, where Moutama or Martaban was their chief port. They long preceded the Siamese in the Tenneserim provinces, and the languages of the Si-mang and Binua of the Malay Peninsula retain deep traces of their ancient influence to the south. A colony is also found in the basin of the Menam. Before the great southern movement of the Lau, the Mon appear to have occupied that basin also, and to have marched and intermixed with the closely allied Kambojans of the lower Mekong. Mr. ORiley thinks that the Mon are only distinguishable from the Burman by their less Mongolian and more Rakhoing aspect. They appear to have been considerably modified by the Indian element which has always been very powerful at the head of the Bay of Bengal. They seem to have been at one time the chief traders eastward of the Bay of Bengal. The Karen also preceded the Burman race in the delta of the Irawadi, and are the joint occupants with the Mon. They are also found in the lower plains of the Saluen, the deltas of the Se-tang and Irawadi, the middle basin of the Se-tang as far as Tongo, and in Tenasserim. In Martaban there is also a remnant of an allied tribe, the Toung-thu. Both the Karen and the Toung-thu, belong to the Yuma branch of the Tibeto-Burman family. The long and narrow hill track between the valley of the Irawadi and the Sa-luen as far north as 23°, is occupied by cognate tribes called Ka-ren-ni (Red Karen) who are said to speak a very ancient dialect of the Yuma family. This branch has a parallel range on the western side of the Irawadi. In their traditions, they assert that they preceded the Burmans as the dominant people of the basin and they seem from very ancient times to have occupied the whole of the valley southward from the valley of the Banak on the west to the borders of Yunnan. No trace of the Mon is now left along the Yuma range,—tribes of the Karen family being the exclusive holders of its inner valleys. Some of the very imperfectly described tribes on the eastern side of the Irawadi, to the north of the Ka-ren-ni, viz.; the Za-ba-

MON.

ing Ka-Khyen, &c., may belong to the older immigration. But the Mon is the only remnant within the ancient Ka-ren province, and its earlier preservation is doubtless owing to the same causes, its arts, civilization and wealth, which have enabled it to hold its own against the Tibeto-Burman horde of the Irawadi. The Nicobar Islanders appear to have been an early colony of the Mon race in its pure or more west Chinese and less Indian condition. They are flatter faced and more oblique eyed than the Rakhoing and Mon, in these resembling the more sequestered hill tribes of the Burman race. In some islands they have been much mixed with Malay colonists. Nicobar phonology is allied to that of the Silong and Simang. The first migrations from the northern side of the Himalaya is now best represented by the Annam, Kambojan, Mon and Lau tribes, who appear to have been at a later period gradually pressed by the Tibeto-Burman tribes, to the eastward and southward. The Mon Anam or East Himalaic tribes, occupy the territory bounded on the north, by the left side of the valley of the Brahmaputra as far as the head of Assam, and a line drawn thence eastwards along the range in which the Irawadi has its sources, and across the converging meridianal chains, beyond, to the most eastern, the Mangli, which separates the Kiang from the M-Kong. The Anam, Kambojan, Siamese, Mon, Burman and the other Ultra-Indian languages are all characterised by strong complex sounds. The Anam and Siamese abound in complex vowel sounds and the Burman family in complex consonantal sounds which are harsh in Singpho, less so in Rakhong, and much softened in Burman. The Anamese group, amongst whom are the Moy, are found in Cochin-China and Tonkin. They are a section of the division to which the Chinese belong. Two thousand years ago, or two centuries before Christ, the Chinese found the Anamese, in possession of the basin of Sang-Koi. The Anamese, in size, form of the head, and person, expression and temperament, have a closer resemblance to some Indonesian tribes. The Javan group has a larger admixture of the Anam type than the Sumatran or Borneo. Anam heads are common in eastern Java and especially among the Bawiau and Madura. The Malayans and western Javans have frequently a more Siamese form. The Anamese want the large straight faces, flat occiput, lowness of the hairy scalp, comparatively small and firm mouth, hard staring eye and grave expression of the Siamese; Anam is Cochin-China: Laos and Ahom belong to Anam.

The Burmans, the predominant people of

MON-ANAM.

the basin of the Irawadi, occupy the lower part of the basin above Pegu, the southern part of the upper basin and the valley of the river beyond, as far as Ba-mo. They are also found in the delta, but their progress there has been comparatively recent, and the prior inhabitants still form the greater majority. Their native name Ma-ran-ma, or M'ran-ma, whence their softened modern M'yan-ma, M'ya-ma, is the origin of the European corruption of the Burman. The principal seat of the Burman power appears to have been for the longest periods in the same part of the basin where it now is. In the era of their greatest stability and prosperity, their capital was at Pagan probably the place of that name above Ava from the second to the middle of the fourteenth century. Previous to this, on their first advance from Aracan, they appear to have conquered the northern part of the ancient kingdom of the Mon—for their capital was for 395 years at Promo. It was not till the middle of the sixteenth century that they succeeded in annexing Pegu. But in the middle of the eighteenth, the Mon threw off the yoke and in their turn subjugated all Burma for a short period. The Burman race differ from the Anamese in being stouter and darker, and in the head being Daya-Polynesian or Turanian oval, and not obtusely ovoid. The head varies greatly and the coarser forms show a tendency to the Binna contraction of the forehead, rendering the lateral expansion of the forehead very marked. The normal, or non-Indianised Burman head, appears in many respects to resemble the coarse Sumatran, Javan, Bornean and Polynesian. This softened Turanian type is decidedly allied to the oblong square and oval Chinese type and not to the ovoid and orbicular type of the Tibetan, some of the Himalayan-Gangetic, the Anam and the Celebesian tribes. The Burmans on the west more often resemble the handsome Asianesian tribes found in Borneo, some parts of East Indoesia, and Polynesia. Burmans and Malays are somewhat stouter than the Siamese, the average height being probably about 5 feet 2 inches. Burman women are more nearly the companions and not the slaves, of the men. But the Tibeto-Burmans and the cognate Indonesian tribes, permit great license to both sexes, prior to marriage, when chastity is not required.—*Latham's Ethnology.*

MONAKALLEE, a river of Chittagong.

MON-ANAM. The Mon Anam or East Himalaic tribes, occupy the territory bounded on the north, by the left side of the valley of the Brahmaputra as far as the head of Assam, and a line drawn thence east-

MONE.

wards along the range in which the Irawadi has its sources, and across the converging meridional chains, beyond, to the most eastern, the Mangli, which separates the Kiang from the M-Kong.

The first migrations from the northern side of the Himalaya are now represented by the Anam, Kambojan, Mon and Lau tribes, who appear to have been at a later period gradually pressed by the Tibeto-Burman tribes, to the eastward and southward.

The Anam, Kambojan, Siamese, Mon, Burman and the other Ultra-Indian languages are all characterised by strong complex sounds. The Anam and Siamese abound in complex vowel sounds and the Burman family in complex consonantal sounds which are harsh in Singpho, less so in Rakhing, and much softened in Burman.

The Anamese group, amongst whom are the Moy, are found in Cochín-China and Tonkin. They are a section of the division to which the Chinese belong. Two thousand years ago, or two centuries before Christ, the Chinese found the Anamese in possession of the basin of Sang Koi. The Anamese, in size, form of the head, and person, expression and temperament, have a closer resemblance to some Indonesian tribes. The Javan group has a larger admixture of the Anag type than the Sumatran or Bornean. Anam heads are common in eastern Java and especially among the Bawian and Madura people. The Malaysians and western Javans have frequently a more Siamese form. The Anamese want the large straight faces, flat occiput, lowness of the hairy scalp, comparatively small and firm mouth, hard staring eye and grave expression of the Siamese: Anam is Cochín-China: Laos and Ahom belong to Anam. The current and convenient principal coin of the Malay and Philippine Archipelago is at present, and has long been, the hard Spanish dollar, the *peso duro* of the Spaniards; and that with globes and pillars, containing 3709 grains of pure silver, and worth in sterling money 5179 pence, has an universal preference. The English rupee and Dutch guilder are but of local currency and always, more or less at a discount. The dollar, in the native languages, is known by various names; the Malays usually call it *real*, which is, no doubt, an "abbreviation of the Spanish *real do a ocho*, or a piece-of-eight." The common name with the Javanese is *ring git*, which literally means "secundary figure." A great variety of small coins of brass, copper, tin and zinc are in circulation throughout all the islands. The most frequent of these is the Dutch *doit*, of which about 300 ought to go to a Spanish dollar. The intrinsic value of all such coins, however, have no relation to their assumed one, and being usually over issued, they are generally at a heavy discount. The small coins of Palembang, Achin, Bantam, and Quada are of tin. Those of the latter place go under the name of *tra*, which is, however, only the word "stamp" or "impression." Of these 160 are filed on a filament of ratan, of which 8 strings or 1280 coins are considered equivalent to a hard dollar. In Bali and Lomboc, the currency consists of Chinese Zinc coins with a hole in the middle for filing them on a string, each string having 200, and five of these are called a *siah*, that is, "one thousand," being the highest denomination of money in the reckoning of the inhabitants of these islands. Their value rises, and falls in the market according to the supply, like any ordinary article of merchandise; so that a Spanish dollar will sometimes buy 800 of them, but often as few as 500 only. All these small coins are generally known by the Javanese name of *pichia*, corrupted pitis by the Malays, a name which had extended to the Philippines. The only

MONEY.

native country of the Archipelago in which a coin of the precious metals seems ever to have been coined, is Achin. This is of gold of the weight of nine grains, and of about the value of 14d. sterling: to which European traders have given the name of a *mace*, a corruption of the Malay *mas*, itself a corruption of the Sanscrit, *masha*, the name of an Indian weight. All the coins of this description that have been seen are inscribed with Arabic characters, and bear the names of the sovereigns under whom they were struck, so that they are comparatively modern. The Javanese appear to have coined some of their own money, as we find from many examples excavated from old temples, and other places.

Money seems to have been coined in China, in gold and silver and lead, so early as Confucius' time, but money payments are still made in kind or by pieces of silver. Most of their calculations are made by a reckoning board. There is no coined money in China, except the brass pieces with a hole in the centre. Silver is sold by the weight, and an ounce is the equivalent of from 1700 to 1800 of these brass coins, which are called "*sapek*" by Europeans, they have some pieces of brass called *tsian*, and in Mongol *tehos*, of which the inhabitants of Siberia make *Tehok* and *Tchek*, they are of less value than a copee. A kind of notes are in circulation among private persons.

In British India, it was enacted that from the 1st September 1835, the coinage of former rupees should cease at all the mints throughout India, and that in future there should be coined a rupee (with doubles, halves and quarters) to be called the Company's rupee which should contain 165 grains (11-12ths) pure silver, and 15 grs. (1-12th) alloy. This new rupee, which was made a legal tender in all payments, is nearly equal to the former Furruckabad, Madras and Bombay rupees, and is received as an equivalent by them and for the Sonat rupee, and for 15-16th of the Calcutta Sicca rupee. It is worth, reckoning silver at 5-6d an ounce, 1s. 11d. and 2s. 0½ stg., its current value being 2s. The Company's rupee bears on the one side the head of the reigning sovereign of Great Britain and in the obverse, the words E. I. Co. and the designation of the coin in English and Persian. It was also enacted that from the 1st September 1835, no gold coins shall be coined at any mint in India except gold mohurs or 15 rupee pieces (with the sub-divisions containing each 165 grains (11-12ths) pure gold, and 15 grains (1-12th) alloy. Such mohurs are consequently worth 29s. 2 each.

MONGHIR.

These coins are marked in the same way as the new rupees but they are not a legal tender.

The Persian coins are of gold, silver, and copper; each metal being struck in almost its pure state. The gold money are called *tomann*; one of which, in intrinsic value may now be equal to ten shillings English, they were worth more, formerly; but during the last fifty years, their size and weight have gradually decreased. There are two sorts of silver money, the highest in value is the real, eight of which amount to a to-mann. The smaller silver coin is called the *white shy*; eight of these being equal to a real. The copper money has the name of *black shahi*; and twenty four of them amount to one real. Tomann are coined in almost every great province; but they differ much in actual value, though all pass current for the same number of real.

Payments are made, in Turkish dominions, in piastres and Spanish dollars, fifteen of the former being equal to one of the latter. The piastre is divided into forty para.

A pound sterling is worth seventy, to one hundred piastres. — *Prinsep's Tibet, Tartary and Mongolia*, p. 50. *Crawford's Dictionary*, p. 285, 286. *Robinson's Travels*, Vol. II, p. 4. *Porter's Travels* Vol. I, p. 250.

MONG-DAYAT-NEE, BURM., or Red-mong-dayat, a tree of maximum girth 2 cubits, and maximum length 15 feet. Not abundant, but found on the sea-shore from Amherst to Mergui and on the Callagouk islands. When seasoned, it floats in water. Used for crooks, and straight parts also of ships, and boats: is a light tough wood with a good grain, but too liable to rot to be recommended. — *Captain Dance*.

MONG-DAYAT PEW, BURM., or White mong-dayat, a tree of maximum girth 2½ cubits, and maximum length 22 feet. Scarce, but found all over the Tenasserim provinces near the sea and at the mouths of the rivers. When seasoned, it floats in water. It is not a good wood, being very perishable. — *Captain Dance*.

MONGHIR, L. 25. 27' 4", N. L. 86° 40' 2" E. in Bengal, in Bahar province, on the right bank of the Ganges. The level of the railway tunnel is 389 ft. The Mean height of the station, ab. 200 ft. above the sea.

The town is the chief place in a revenue district of Bengal formed out of the ancient Bahar. It is written Monghir and Monghyr and is a pretty town in a charming green valley, with the broad river washing it on two sides and hills in the back ground. Monghyr was captured on the 10th October

MONGOLIA.

1763. Monghyr, is celebrated for its iron manufactures, especially of muskets, in which respect it is the Birmingham of Bengal. Generally speaking, these weapons are poor, though stamped with the first English names. A native workman will, however, if time and sufficient reward be given, turn out a first rate fowling-piece. The inhabitants are reported to be sad drunkards, and the abundance of toddypalms was quite remarkable. — *Hooker Him. Jour.* Vol. ? Page 87. *Tr. of Hind.* Vol. I, P. 107.

MONFEE ISLAND, on the E. coast of Africa, extends from lat. 8° 2' S. to lat. 7° 38' S., and in long. 35° 57' E.

MONGHOL, See Haiyu; Chetang. Mongol.

MONGHY PAITAN a town in Berar.

MONG-NYEN, BURMESE. Sinapis orientalis.

MONGOLIA consists of four great divisions, viz Inner Mongolia, lying between the Great Wall and the Desert of Gobi: Outer Mongolia between the Desert and the Altai Mountains; the Kokonor country between Kansah, Szechuen and Tibet and 4th the dependencies of Alia-sutai to the north of the Kalkas Khanates.

The desert of Central Asia, extends from the Atlantic to the Yellow Sea. A strip of rich vegetation occurs in its centre where the Tigris and Euphrates and their affluents enrich the country. To the westward of it are the seas of sand of the Arabian and African wastes, seldom raised above, often sinking below, the level of the ocean. To the eastward of the rich tract in Persia, Kerman, Seistan, Chinese Tartary and Mongolia, the desert consists of a series of plateaux, having from 3,000 to nearly 10,000 feet of elevation.

The great highway between Peking and Europe, from time immemorial, has been the caravan tract from the western end of the Great Wall across the desert of Gobi. The route issues from the western end of the Great Wall, and moving through the Kiayu Pass, has to traverse N. W. 500 miles, of a desolate sand tract to reach the city of Khamil. At this town the road bifurcates, the upper branch leading through Barkul Urumchi and Kurkur-usu into Dzungaria; the lower through Pijan, Turfan, Karashar, and Kuchu to Aksa in Eastern Turkistan. While Chinese rule prevailed, Dzungaria and Eastern Turkistan formed the province of Ili.

The Gobi desert is believed to be inhabited by a lonely demon, whom they call the Ghol-i-Biaban, or spirit of the waste, a gigantic and frightful spectre which devours passengers. It is quite an oriental idea, to make

MONGOLIA.

demons and evil spirits wander through dry places. But the belief that wildernesses are haunted places, is a very old and general one. Our blessed Lord himself in a very solemn passage, Luke xi. 24, adopts the Jewish phraseology as to this matter. Pliny says (vii 2), that in the deserts of Africa phantoms in human shape appear to travellers and immediately vanish again. But the belief is specially prevalent among the nations of Central Asia. By them accordingly "deserts and the like, where nature shows herself in vast forms and in all the terrors of her influences are held to be the especial head quarters and rendezvous of malignant spirits...hence the wildernesses of Tifran, and particularly the great sand-waste of Gobi have from hoar antiquity had an evil fame. The Turks have a saying that evil spirits play at ball in desert places; both Fa-Hian and Marco Polo allude to the evil genii of the deserts of Central Asia, and Rubruquis tells of a frightful defile, where the demons were said to snatch travellers off their horses.

Baikal lake in Mongolia is an expansion of the Angara river. Its length is nearly 400 miles (according to Bell 300 miles) with 45 miles of average breadth from north to south. It has steam boats plying on it. Its seal and sturgeon fisheries are valuable, and the oil of the fish called the golomyinka, the *Callionymus Baicalensis* is valuable. Mountains encompass the lake entirely. The river Selingue falls into it from the south-west and here the lake is about 50 miles broad; the Paour-ku-simo from the south-east, and the Gong-ko-la (Upper Angara) from the north-east. Towards the north-eastern end of the lake is an island called Oleao-lan (Olehon) about 50 lee in breadth, and 200 or more in length. This island is frequented by 50 or more of the families of the wandering tribes of the Mongols and the Pu-la-te (Boraty of Bell), and they bring hither with them their horses. Baikal lake is 1,715 feet above the level of the sea. Selinghinsk, 1,779 feet, and Kiakhita 2,400 feet: consequently higher than all the towns of the Harz and the Swiss Alps. "The Baikal has many and various kinds of excellent fish, particularly sturgeon, and a fish called omully, in shape and taste resembling a horning, but broader and larger. The omully come in vast shoals from the Baikal, in autumn, up the river Selingue to spawn, after which they return to the lake so weak that many of them are carried down floating on the surface of the stream. During the progress of the omully up the river, the inhabitants of the adjacent villages assemble with their nets, and catch as many of them as they wish.

MONGOLIA.

On this occasion the poor take what they can use, and the rest are left upon the banks. These fishes advance up the river about 10 miles a day. On their first appearance, the report is soon spread over the country, and, in two or three hours, the people catch as many as they need either for present use or winter provisions. This fish is very agreeable food either fresh or salted. They are observed to be much better and fatter the nearer they are caught to the sea.

Dobsoon-noor or the Salt Lake, is celebrated over all the west of Mongolia. It furnishes salt, not only to the neighbouring Tartars, but to several provinces of the Chinese empire. The Dobsoon-noor is less a lake than a vast reservoir of mineral salt mixed with nitrons efflorescence. The latter are of a faint white and friable between the fingers; they are easily distinguishable from the salt, which is of a greyish tint, and with a shining and crystalline fracture. The lake is nearly ten miles in circumference, and here and there are yourtes inhabited by the Mongols, who are occupied with the salt trade; they have also Chinese partners, for Chinese take part in every kind of trade or industry. The manipulation to which the salt is subjected requires little labour or science. It consists of nothing more than picking up the pieces, laying them in heaps, and covering them with potter's clay, and the salt sufficiently purifies itself.

The Mongol descendants of Chingis-khan as a conquering race, followed the Turk and the Hun, conquered China in the east, where they founded the Mongolic dynasty of Ynan, and in the west, after subduing the khalifs of Bagdad, and the sultans of Iconium, they conquered Moscow, and devastated the greater part of Russia. In 1240 they invaded Poland, in 1241 Silesia. Here they recoiled before the united armies of Germany, Poland, and Silesia. They retired into Moravia, and, having exhausted that country, occupied Hungary. At that time they had to choose a new khan, which could only be done at Karakorum, the old capital of their empire. Thither they withdrew to elect an emperor to govern an empire which then extended from China to Poland, from India to Siberia. But a realm of such vast proportions could not be long held together, and towards the end of the thirteenth century it broke up into several independent states, all under Mongolian princes, but no longer under one Khan of Khans. Thus, new independent Mongolic empires arose in China, Turkestan, Siberia, Southern Russia, and Persia. In 1360, the Mongolian dynasty was driven out of China; in the 15th cen-

MONGOLIA.

tury they lost their hold on Russia. In Central Asia, they rallied once more under Timur (1369) whose sway was again acknowledged from Karakorum to Persia and Anatolia. But in 1468, this empire also fell by its own weight, and for want of powerful rulers like Chongis-khan or Timur. In Jagatai alone, the country extending from the Aral Lake to the Hindu Kush, between the rivers Oxus and Jaxartes (Jihon and Sihon), and once governed by Jagatai, the son of Chingis-khan the Mongolian dynasty maintained itself, and thence it was that Baber, a descendant of Timur, conquered India, and founded there a Mongolian dynasty, surviving up to the year 1857 in the great Moghls of Delhi. Most Mongolic tribes are now under the sway of the nations whom they once had conquered, the Tungusic sovereigns of China, the Russian Czars, and the Turkish sultans. The Mongolic language, although spoken (but not continuously) from China as far as the Volga, has given rise to but few dialects. Next to Tungusic, the Mongolic is the poorest language of the Turanian family. The Mongols who live in Europe have fixed their tents on each side of the Volga and along the coast of the Caspian Sea near Astrachan. Another colony is found south-east of Sembirsk. They belong to the Western branch, and are Olöt or Kalmuk, who left their seats on the Koko-nur, and entered Europe in 1662. They proceeded from the clans Durbet and Torgod, but most of the Torgod returned again in 1770, and their descendants are now scattered over the Kirgisian steppes. For a time at least there were two Mongol dynasties in Central Asia, between the frontier of the Great Khan and the Caspian. Kaidn, great grandson of Chinghiz, through his second son and successor Okkodni, and who disputed the sovereignty with Kublai, through life, represented one of these, whilst that of Chagatai was the other. The Mongols of the Russian empire comprises six Kalka tribes the Buriat and the Kalmuk.

The Buriat area occupies the parts about Nizhni Udinsk, to the east of the Lena, and extends to the country of the Khorin and Barguzin tribes (both of which it includes) beyond Lake Baikal. It is bounded on the south by the Chinese frontier, beyond which few or no Buriat are to be found; the Mongols of the northern parts of China and Mongolia, in the proper sense of the term being Kalkas. The Buriat amount to about one hundred and ninety thousand souls; some few being mahomedans, some christians, some shamanists, the majority buddhists. The latter brew an intoxicating liquor called kumiss; some of the tribes may brew beer.

MONGOLIA.

The Kalmuk of the Russian Empire are 119,162 viz.: in the Government of

Astrakan ...	87,556	Saratov ...	692
Caucasus ...	20,591	Stavropol ...	10,223

In 1700-1703, a Durbet migration took place, in the same direction. One of the leaders of these movements was Auiki Khan, who assisted Peter the Great against Persia. By 1771, discontent had arisen, and, a large, though partial, re-migration was effected through the secession of seventy thousand families. They left their Russian occupancy against the will of the Russians and were followed by a Russian army. They found no friends in the countries through which they passed; but, on the contrary, bitter enemies, who treated them as unwelcome visitors. These harassed them in their journey; and the Russians pressed upon them from behind. However, they either made or found a way, and forced themselves forward to the frontiers of China; which, after a loss of 20,000 families, and innumerable hardships, they reached their destination a starved and stricken remnant. They were, however, hospitably received. The Buriat Mongol, are a nomadic people who live in the provinces of Irkutsk, south of lake Baikal?

Of the three great races in China, Chinese, Mongol and Manchu, the predominating color of the skin of the Chinese is yellow, but yellow brown and sometimes a maroon tint occur. The face is broad and flat: cheek bones projecting, irides black; eyes oblique: beard scanty, stature above that of the Malay and Tibetan, below that of the European. The sea-coast people are skilful and enterprising, with that self-reliance which enables nations to emigrate, and we find them swarming in the Malay ports in Singapore, Borneo, and the Philippines, and numbers are in Australia, the West Indies, Sandwich Islands and California, but, except in Buddhist Burmah, they are not settlers, only forming temporary connections, sending all their savings, and looking forward to return, to their native land. Next to the Malay this people are the most formidable pirates of the eastern seas. The Mongol and Chinese have scanty beards. The numerous military feudatories of the Empire are scattered through the regions known to the Chinese geographer as Inner and Outer Mongolia, Uliasutai, and Tsing Hai, or Kokonor; but there are also the troops of Tibet under the resident Minister of that country. The tribes acknowledging the sway of China are divided into Inner and Outer Mongolians. The former occupy the region to which their name refers them; the latter, all the other tracts and districts above mentioned.

MONGOLIA.

Inner Mongolia, lying between the Desert of Gobi and the continuous frontier of Manchuria and China, was occupied, in 1812, by 24 tribes, differing in name, irregularly ranged under 49 standards, and divided, in uneven proportions, into six chalkan, or leagues.

The Outer Mongolians were, 1st, four tribes of Kalkas of different names, under khans, which, with two fragmentary tribes attached to them formed four leagues; they numbered in all eighty-six standards, and resided in the territory north of the Desert of Gobi, geographically named Outer Mongolia; 2d, Eleven tribes, not in leagues, under 34 standards, scattered to the west of the Holan mountains, in the south-west of Inner Mongolia; to the south of the Altai; and to the north of the Tengkiriranges; 3rd, Two tribes of mohammedans, under two standards, at Hami and Turfan, within the provincial boundaries of Kansuh, south of the Celestial Mountains; and 4th, Five tribes under 29 standards round Koko-Nor, called by the Chinese Tsing-Hai, or Azure Sea. There are lamas of both Inner and Outer Mongolians. Nearly every standard of the above, if not all, has a native head entitled a Dzassak, whose chieftainship is, with slight limitations, hereditary; the people under their rule are collectively styled orbadu or orputu, the lamas excepted, who are distinguished as of Shapi Nor; their Dzassak take the prefix lama before their title. The few tribes, or remnants of tribes, not under such chieftains, are under the more immediate authority of the Banner generals and resident Ministers from China. These last may be briefly enumerated; under the Tsiangkiun of Sui-yuen are the Tmiet of Shansi beyond the Wall; under the Tatung at Kalgan, on the Wall, the most privileged tribe of Chahar Bargon incorporated in Chahar, Kalkas and Eluth; under the Tuntung at Jeh-ho, Tashitava Eluth; under the Futatung at Hurun-pir, Eluth and New Bargon; under the Tsung-kwan at Tasangula, Solon, Taguri, Orunchun and Pilar, paying peltry; both these being under the Tsiangkiun of Sagalien. In Ili, the Tsiangkiun has authority over Eluth and Chahar of his own Central Province of Ili, who have also Chinese ministers over Eluth, Chahar, and Hassack under the Tstantan Minister resident at Tarbagatai, and over the mohammedans of the eight cities in Ili, south of the Tien Shan, who are under resident ministers of different degrees.

In Uliasutai province, which receives a small garrison from the Tsiangkiun of Shansi, there are Tanguu Uriankai, some of

MONGOLIA.

them Yumu herdsmen, some Tasang peltry-men, under the Tsiangkiun in observation at Kunun, who is father supreme over the ministers at Kobdo, having charge of the Mingat, Eluth, Chaksim, Altai Uriankai and Altai-Nor Urian-kai of the far province.

On the borders of Tibet are Tamuh, or Dam Mongols, under eight standards, amenable to the authority of the resident Tsantsan.

As to the feudal constitution of these tribes. The six ming, chalkan or leagues, into which these twenty-four tribes are formed are each under a head or elder, and a lieutenant, chosen from a list of Dzassak presented to the emperor by the Colonial Office. Every tribe is bound to assist any other in the same league which may be in danger. Once in three years, the leagues are mustered by four high commissioners selected by the emperor from incumbents of high civil and military posts in the empire; their visit is of a thoroughly inquisitorial character. The Dzassak are in turn compelled to pay visits to Peking; the year in which it is not the duty of this or that Dzassak to go, he sends a Taikih. On stated occasions, all assemble in court costume to do homage in token of fealty before the door consecrated to Majesty at the head quarters of the tribe.

The internal economy of the Outer, is much the same as that of the Inner, Mongolians. Their Dzassak are ennobled by all the same titles except Tapunang of which there are none. Some of the Dzassak, whether otherwise ennobled or not, have the title Khan, which is superior to any of the rest, and brings with it a higher allotment of pay and gifts. Their chalkan or leagues, have each a captain-general, and a lieutenant like the Inner Mongols, and are like them mustered and inspected triennially. Their military organization is, with a few exceptions, the same. First, in the region of Outer Mongolia, we find four leagues of Kalkas, each under a khan: 1st, the Tche-ta khanate, numbering 20 standards under 58 tsoling; 2nd, the Sain-noin 24, including two Eluth standards, in 38½ tsoling companies; 3rd, the Tsetson, 23 standards in 46½ companies; 4th, the Dzis-saktu, under 19 standards, including 1 of Khoits in 24½ companies. Now come the Durbet in two wings, each of which is a league under a lieutenant general, appointed as above: the left comprising ten standards of Durbets and one of Khoits, in 11 companies; the right, three of Durbets and one of Khoits, in 17 companies. Their position is beyond the north-west frontier line of the Dzassaktu; they extend across the province of Kobdo north of the

MONGOLIA.

city of that name, and their troops, amounting in 1812 to 1400 makia, were under the Tsantsan of the Chinese Government at Kobdo. The two wings are subject to one khan. Under the same officer of Kobdo, are the troops of the New Turguth of the Uragu river, in the south-east of the same province, and Hoshoit of the Djabkhan farther north. The former under two standards in three companies, which would give but 150 makia, form a league; the single standard and company of the latter, furnishing 50 makia, belong to none.

Under the Kurun general are 595 Tasang families of Uriankai Tangun, paying 2 skins of marten fur, and 412 paying 80 gray mouse skins, under the Tsantsan of Kobdo, 412 of Altai Tangun, paying gray mouse skins, 253 marten skins, and 429 paying four fox skins each: also 61 of Altai Nor Tangun paying gray mouse skin, and 147 paying marten fur. Of Yumuh there are, under the general, eight companies of Uriankai, and under the Tsantsan, seven of Altai, and two of Altai Nor.

Of the leagues whose soldiery is under command of the Tsiangkinn of Ili, of whom some mention has been made before, there are four of Old Turguth and one of Hoshoit distributed in five circuits. The north contains the Old Turguth of Hopoksiloh, three standards in 14; the east, those of Tsirolang, two in 7; the west, those of the river Tsing one, in 4 companies. These are north of the Tengkir, stretching well into Tarbagatai.

The Mongolians of Central, Northern and Eastern Asia are a squat, flat faced, peculiar eyed, beardless people. The Mongol is of moderate stature, but his large leather boots, and wide sheep-skin robe, give the person a short and squat appearance. To complete the portrait must be added a clumsy, heavy gait, and a harsh, shrieking language, bristling with terrible aspirations. Yet notwithstanding this harsh and savage exterior, the Mongol is full of gentleness and bonhomie; he passes suddenly from the wildest and most extravagant gaiety to a melancholy that has nothing repulsive. Timid to excess in general, when excited by fanaticism or the desire of vengeance he displays an impetuous courage that nothing can arrest; he is simple and credulous as a child, and is passionately fond of stories and marvellous recitals. To meet a travelling Lama he always reckons a piece of extreme good fortune. The Si-Fan, or Oriental Tibetans, are nomadic, like the Mongol-Tartars, and pass their lives wholly in the care of their flocks. They do not lodge, like other Mongols, in Yourta, cover-

MONGOLIA.

ed with felt, but in large tents of black linen, of a hexagonal form, without any wood-work inside to support them. The side angles of the base are attached to the ground by nail, and the top supported by cords, which, are fastened into the ground at a certain distance from the tent. The nomadic Si-Fan are easily distinguished from the Mongols by their more expressive physiognomy, and their greater energy of character; their faces are not so flat, and their manners have an ease and vivacity which contrast strongly with the heaviness of the Tartars. Their encampments resound with noisy songs, merry games and shouts of laughter; but with these dispositions to gaiety and pleasure, they are of a warlike character and indomitable courage; and though their names are on the list of tributary nations, they obstinately refuse both tribute and obedience to the emperor of China; indeed, they manifest the most profound contempt for Chinese authority. Some of them carry their predatory incursions to the very frontiers of the empire, and the Mandarins do not dare to interfere with them. They are good horsemen, though, in this respect, they do not equal the Tartars. But, besides attending to their flocks, they practise some kinds of industrial occupations, and turn to account the wool of the sheep and the long hair of their oxen, weaving from them a coarse kind of cloth, which they use for tents and clothing. When they assemble round their great cauldron full of milk-tea, they give themselves up freely to their gossiping humour, and their taste for stories about Lamas and robbers; one need only set them going, and one is sure of seeing them display an apparently exhaustless repertory of anecdotes, local traditions, and legends.

There is a rollster kept of the Mongolian nobles and they are obliged to present themselves every year at Peking. If the emperor cross the border to hunt, they do him homage at his hunting-ground instead, and the expedition is under the conduct of some of them, and the rest attach themselves to his suit while it lasts.

The latest investigator of the general subject of human affinities includes in the great Mongolian family not merely the high Asian nomades or the Turk, the Mongol and the Tangut, but also the Tibetan, the Chinese the Indo-Chinese, and the Tamulian. And under the term, Tamulian, he includes the whole of the aborigines of India, whether civilized or uncivilized, from Cape Comorin to the snows, except the inhabitants of the great mountainous belt confining the plains of India towards Tibet, China, and Ava.

MONGOLIA.

These last he thinks are, in the North West, derived from the Tibetan stock; and in the South-East from the Indo-Chinese stock; the 92° of East longitude, or the Dhanri river of Assam, apparently forming the dividing line of the two races, which are each vastly numerous and strikingly diversified, yet essentially one, just as are the no less numerous and varied races of the single Tamulian stock. Mr. Hislop took almost a similar view, as the result of his philological inquiries.

The Mongol in Kabul, Herat and Persia are called Kalmuk in Herat and Affghanistan, and were introduced from Balkh towards the end of the 18th century. Those of Kabul and Persia, are now called Aimak or Char Aimak, and the Hazara. The term Aimak is a Mongolian, Mantshu and Turk word, meaning tribe. They dwell to the north of Herat and Kabul in the range of the undulating country, which in some places assumes a mountainous, in others a hilly character, and in some parts is well-watered, in others bleak and rough, forming a water shed of two natural divisions, from the west of which flow the Murghab, the Tajend and the Furrak-Rud, and from the east, the Helmund, the south eastern feeders of the Oxus and the north western feeders of the Kabul river.

In the Derajat are warlike Baluchi and Afghan tribes the most unyielding of whom are the Waziri, who continue to resist the efforts of English power to restrain their inroads on the plains. Still further north and west are the numerous tribes of Affghanistan, of whom may be mentioned the powerful Durani race and the Tajik tribes.

In the Bunnu valley, there are mixed races and we may notice the Durda in Giljit and Chulas.

The Thibetan and Nepalese are a Mongol race.

The Darma race occupying the Darma pass leading into Gurhwal, are said to be the descendants of a body of Mongol whom Timur left behind him in Kumaon. They practise divination, taking their omens from the warm liver of the sacrificed sheep. They eat the yak and the cow, inter their dead for a time and then, in the month Kirtik, they exhume and burn them. The great aboriginal stock of the inhabitants of the mountains, east of the river Kali, as in Nepaul, is Mongol. The fact is inscribed in characters so plain, upon their faces, forms, and languages, that we may well dispense with the superfluous and vain attempt to trace it historically in the meagre chronicles of barbarians.

From Kashmir, eastwards, all the easily accessible portions of the Himalaya are occu-

MONGOLIA.

pied by Arian Hindu as far as the eastern border of Kumaon and the Kali river separating Kumaon from Nepal—the Tibetans being here confined to the valleys about and beyond the snow. People of Tibetan blood have migrated into Nepaul, throughout its whole length, and have formed mixed tribes whose appearance and language is more Tibetan than Indian, but whose religion and manners are Hindu. East of Nepaul, in Sikkim and Bhutan, the Hindu element almost disappears, and the Thibetans are altogether dominant.

The Ugro-Tartarian languages, of High-Asia and other regions, which other writers style Turanian, are those of Dr. Pritchard's second group of nations belonging to the same great family and include the various hordes who have been known under the names of Tartar, Turk, Mongol, Mantchu, and Tungus. All these nations appear, from the result of late researches, to be allied in descent, though long supposed to be quite separate. In the vast region of High-Asia, extending from the chain of Altai to that of the Himalaya are the pasture-lands, where, during immemorial ages, the nomadic tribes of that region have fed their flocks and multiplied those hordes which from time to time descended in immense swarms on the fertile regions of Asia and of Europe. Perhaps the earliest of these invasions of the civilized world was that of the Hiong-nu, expelled from the borders of China by the powerful dynasty of the Han. These were the people who, after their inroad on the Gothic empire of Hormanrich, made their way, under Etzel or Attila, into the heart of France. Hordes from the same regions under Togrul-Beg, and Seljuk, and Mahinud of Ghizni, and Jengiz, and Timur and Othman, overwhelmed the kaliphate and the empires of China, of Byzantium, and of Hindustan, and lineal descendants of the shepherds of High-Asia still sit on the throne of Cyrus, and on that of the Great Constantine. As a branch of the Ugro-Tartarian, he speaks of some of the insular nations to the eastward of Asia and near the coast of the Pacific Ocean. The idiom of the islands comprised in the empire of Nippon, as well as that of the independent Liu-kiu Archipelago, bears some signs of affinity to those of the Ugro-Tartarian nations, and he adds that Mr. Norris had assured him that the principle of vocalic harmony and other phenomena of the Tartar languages prevail in the idiom of the Japanese and Liukiu islands. As a seventh group of his Ugro-Tartarian, he classes the aboriginal inhabitants of India, who were expelled from Hindustan by the Brahmins and the Arian people who

MONGOLIA.

accompanied them across the Indus, and retired, as it is supposed on apparently insufficient proof, into the Dekhan. They still occupy the greater part of that peninsula, and a portion, at least, of the island of Ceylon. Their idioms—the Tamil, the Telugu and the Karnataka of the Mysore,—are sister dialects of one speech, and he considers it likely that the languages of the mountain tribes of India, the Bhil, the Goud, the Toda and others, belong to the same stock. Dr. Prichard adds that professor Itsk had conjectured that these nations are also of the Tartar stock. Their language has some of the peculiarities of structure which have been pointed out. He also observes that there are some curious analogies between the Tamulian and other dialects of the Dekhan and the languages of Australia, with which we have obtained some acquaintance through the labours of Mr. Threlkeld and several other missionaries, and from the able researches of Captain Gray.

Hindu, Mongol and Kalmuk women must not speak to their father-in-law nor sit down in his presence. A similar practice prevails amongst the Ostiak of Siberia, but with them the son-in-law will not look at his wife's mother, and the hindu and Ostiak women never pronounce their husband's name, nor a husband the wife's name but call them man and woman.

Among the Mongol when a marriage is arranged, the girl flies to some relations to hide herself. The bridegroom coming to demand his wife, the father-in-law says, "My daughter is yours; go, take her wherever you can find her." Having thus obtained his warrant, he, with his friends, runs about searching; and having found her; seizes her as his property, and carries her home as it were by force.

Rubruk relates that he saw in the solitudes of Tartary asses that resembled mules, and he probably speaks of the animal called the hemion, *Asinus hemionus* which Messrs. Huc and Gabet often met with in numerous herds during their journey from Pekin to Lha-ssa, through the Mongolian steppes.

A certain kind of dumb trade prevails indeed more or less in most Asiatic countries, including Mongolia and possibly China, by which bargains are driven and concluded by two parties fingering each other's knuckles under a shawl without a word spoken the stories of the Seric trade was have risen out of this practice.—*Rawlinson*, Vol. i. p. 1; *Schmidt*, *Narrative*, pp. 45, 53; *Timkovsky's Journey to Pekin*, I, 17; 18; 380. *Huc*, *Recollections of a Journey*, pp. 127; 128; 153; 217; 218. *Professor Max Muller Lectures on Science of Language*, p.p. 285; 287; *Yule*,

MONGOOS. Anglo-Indian, a name applied to species of *Herpestes*, viz:—

brachyurus, Java.
exilis, Archipelago.
fuscus, *Waterh.*, Neilgherry brown mon-goose.
griseus, *Geoffr.* Madras mongoose, India.
javanicus, *Geoffr.* Java, Sumatra.
jerdoni.
malaccensis, *F. Cuv.* Bengal mongoose.
monticollis, *W. Elliot*, Long tailed mon-goose.
nipalensis, *Gray*, Gold spotted mongoose, of Nepal.
nyula, *Hodgs.* The nyul or neyool, of the Terai.
smithii, *Gray*, Ruddy mongoose.
vitticollis, *Bennet*, striped necked mon-goose.

The current name of these *Herpestes*, is written Mongoos, Mongoose and Mungus. One species, called by the Singhalese *hotambeya*, is believed by them not to prey upon serpents, but to live near rivers and mud brooks, the adjacent thickets affording them shelter, and their food consisting of aquatic reptiles, crabs and molluscs. The *Ichneumon* of the Egyptians, is the *Herpestes ichneumon*, a quadruped celebrated for destroying serpents and crocodiles. It was also called *Ichneumon pharaonis*. The mongoos, animals, the *ichneumon* of the Egyptians the *Mangouste* of the French, the *Mangus* of Hindostan and the *Kere-pulli* of the Tamil people, are all of active habits, and of bold and sanguinary dispositions. The Madras mongoose is spread through most parts of the South of India up to the Nerbuddah, the North West Provinces and the Panjab. It hunts for and eats the eggs of birds that lay on the ground, kills lizards, rats, and small snakes, is very destructive to poultry. Dr. Jerdon does not believe that it will voluntarily attack a large snake or that it is not sensible of the cobra poison, but the prevailing notion in India is that it is the natural enemy of the cobra and that the cobra poison makes no impression on it. The Bengal mongoos is of

MONKEY.

similar habits to that of Madras, and is found in Bengal, Assam, Burmah, and Malay Peninsula. The long tailed mongoos, is found in the Eastern Ghats of the Peninsula of India as also is the ruddy mongoos. The gold spotted mongoos occurs from the Panjab, along the Himalaya through Bengal to the Malay Peninsula. The Neilgherry brown mongoos is restricted to the Neilgherries. *H. vitticollis* occurs along the western side of India from Dharwar through Travancore to Ceylon, *H. Nyula* *Hodgs.* in Nepal, lives in burrows of its own making *Horsfield, Tennant, Blyth, Jerdon.*—See *Herpestes, Mammalia.*

MONGRA or **pakaura HIND.**, a sweet-meat.

MONGY PATTUN. A town in the Dekhan; anciently called Dhauk. See Balla, Mungi-paitun.

MONIKOIL. See India.

MONIMIACEÆ. *Lincl.* an order of plants consisting of 1 species, of Ambora.

MONITOR DRACÆNA. *Lincl, Gray.*

Talla-goya SING.

The iguana of Ceylon, about 4 or 5 feet long. A still larger species, the Kabaragoya, is partial to marshy ground, and when disturbed upon land, will take refuge in the nearest water. From the somewhat eruptive appearance of the yellow blotches on its scales, a closely allied species, similarly spotted, formerly obtained amongst naturalists the name of Monitor exanthematicus, and the Singhalese appellation of this one, kabara, is suggestive of the same idea. Externally applied it is considered a cure for cutaneous disorders, but taken inwardly is poisonous.—*Tennant Sket. Natural History* p. 272.

Apes form the sub-family Simianæ, of the family Simiadæ, or monkeys, of the natural order Primates. Apes are represented in India by two species of Simia. The ancient Egyptians are said to have worshipped monkeys, and some of them in India are still worshipped. The various kinds of ape seem to have been made known to the Hebrews, Greeks and Romans, by specimens brought from Africa and India; those of the Hebrews probably from India, the Hebrew name Koph

MONKEY.

being almost the same as the Sanscrit Kapi. Apes, gold and ivories could however have been got from many parts of Africa, as also from the South and East of Asia, and their Sanscrit, Ethiopian, Hebrew, Greek, and Persian names, Kapi, Ceph, Koph, Kephos or Kepos, Keibi and Kubbi, are identical and show that the apes may have been brought from any of those regions—the Singhalese, Tamil and Telugu names Kaki, Korangu and Kothi are less similar. Had the Hebrew ships visited the isles in the Malay peninsula, Sumatra, Java or Borneo, they would have known of the Simia satyrus, the Orang utan of Malacca, and Sumatra, the Mia of Borneo or have seen the Siamanga syndactyla, the long arms of which measure five feet six inches across in an adult about three feet high. Mr. Russell Wallace has given the names for monkey in 33 languages of the Eastern Archipelago none of which have any resemblance to the Kapi, Kubbi or Koph of the Sanscrit, Egyptian and Hebrew, but one of them the Kurango of Balanghitam in N. Celebes, is almost identical with the Tamil Korangu. The names are,

Aruka of Morella of Amboyna.

Babah, of Sanguir, Siau.

Budess, Javanese.

Bohen, of Menado and Balanghitam of N. Celebes.

Dare of Bouton and Salayer of S. Celebes.

Kess of Amblaw, and of Cajeli, Wayapo and Massaratty in Bouru and Batunerali.

Kessi of Cajeli.

Kesi of Camarian and Teluti in Ceram.

Kurango of Bolangbutam in N. Celebes.

Lebi of Matabello.

Lek of Teor and Gah in Ceram.

Luka and Lukar of Teluti, Ahtiago and Tobo of Ceram.

Meiram of the Alfuro of Ahtiago in Ceram.

Mia of the Sulu Islds. Tidore and Galela of Gilolo.

Mondo of the Baju.

Minnyect, Malay.

Nok of Gani of Gilolo.

Roke of Bonton of Celebes.

Rua of Larike and Saparua.

Sia of Liang in Amboyna.

Yakiss of Wahai in Ceram.

Apes, monkeys and baboons are arranged by naturalists under the family Simiadæ those in the S. and E. of Asia may be thus shown;

Silenus veter, Linn., Ceylon, S. India.

170 species of mammalia are known to inhabit Indo-Malaya. Of these, are 24 of the quadrumana or monkey tribe, 10 of which occur in the Malay peninsula, 11 of them in Sumatra, 9 in Java and 13 in Borneo. The Orang-utan are found only in Sumatra and Borneo. The Siamang, next to them in size, in Malacca and Sumatra, and the long-nosed monkey only in Borneo. The gibbons or long-armed apes and monkeys and the lemur-like animals, *Nycticebus*, *Tarsius*, and *Galeopithecus*, are found in all the islands. With the exception of the Orang-utan, the Siamang, the *Tarsius spectrum* and the *Galeopithecus*, all the Malayan genera of quadrumana, are represented in India by closely allied species. In the Indo-Malay region are 33 Carnivora, 8 of which, a tiger, leopard, civet, tiger-cat and otter are found in India and Malacca and 20 in the Malayan region : 13

MONKEY.

have representatives in India, of closely allied species. The Malacca gibbon, *Helictis orientalis*, has the *H. Nepaleusis* in the Himalaya. There are 22 hoofed animals in Indo-Malaya, seven of which are found in India and Burmah. The *Bos sondaicus* is found in Burmah, Siam, Java and Borneo. There is a goat-like animal in Sumatra; the two horned and the long horned rhinoceros occur in Burmah, Sumatra and Java, and the elephant of India is found in Malacca, Sumatra and Borneo. There are about 50 bats, of which under a fourth part occur in India; 34 rodents (squirrels, rats, &c.) of which 6 or 8 are Indian, and 10 insectivora, 9 of which are peculiar to the Malay regions. The Tupaia, insect-eaters, closely resemble squirrels, are almost confined to the Malay islands, as also are *Ptilocercus Lowii* of Fo neo and *Gymnurus Rafflesii*. In Timor, there are 15 bats, and 7 land mammals; amongst them the *Macacus cynomolgus*, the common monkey of all the Indo-Malay island: *Paradoxurus fasciatus*, a civet cat, found over much of the Archipelago.

The monkey, it is often asserted manifests affection and sympathy in ways almost human. V., a writer in the *Times of India* of 25th August 1868, mentions that he once heard a number of monkeys making much noise and he sent a Bhil to ascertain the cause. The Bhil returned and mentioned that a female of the herd was carrying about a dead young one in her arms, and the rest were making a noise in consequence. Hindus believe that, except when killed by man or beast, the monkey never dies. *Hylobates*, the 'wa-wa' or long-armed ape, is the most beautiful of all the monkey tribe. The fur of this gentle little animal is grey, its face, hands, and feet, are jet black, in features it more resembles those of the human race than the orang utan. *Hylobates hoolook*, the Hoolock is the *Simia hoolook*, *Harlan*; *H. seyrices* and *H. coromandelus*, *Ogilby*; *H. hooloch*, *Lesson*, is a native of Assam. *Hylobates lar*, the Gibbon; *Homo lar*, *Linnaeus*; *Simia longimana*, *Schreber*; *S. albimana Vigors* and *Horsfield*; and *Le Grand Gibbon of Buffon*; is a native of Malacca, where it is known as the white handed Gibbon. The contrast which this animal offers with *H. hoolook*, is very remarkable. The body is proportionally much shorter; and it is quite incapable of walking in the erect attitude commonly assumed by *H. hoolook*, always creeping forward when on the ground in a crouching position.

Hylobates leuciscus, the silvery gibbon, or Wow-Wow, *Simia leucisca*, *Schreber*, *Audub.* is native of Malacca.

MONKEY.

Notwithstanding the unequalled agility of the monkey, it falls a prey, and not unfrequently, to the leopard. The latter, on approaching a tree on which a troop of monkeys have taken shelter, causes an instant, and fearful excitement, which they manifest by loud and continued screams and incessant restless leaps from branch to branch. The leopard meanwhile walks round and round the tree, with his eyes firmly fixed upon his victims, till at last exhausted by terror, and prostrated by vain exertions to escape, one or more fall a prey to his voracity.

The Chinese are skilful in teaching the smaller kinds of monkeys various tricks and persons carrying them around the country to entertain the populace with their antics are often met. Mr. Bretou gives one picture of their adroitness and usefulness in picking tea in Shantung from plants growing on otherwise inaccessible acclivities which if not misrepresented rests on doubtful authority. One of the most remarkable of the monkey tribe is the "doug" or Cochin-Chinese monkey (*Simia nemous*) which is said to occur also in Kwangsi. It is a large species of great rarity, and remarkable for the variety of colors, with which it is adorned. Its body is about two feet long and when standing in an upright position its height is considerably greater. The face is of an orange color and flattened in its form. A dark band runs across the front of the forehead and the sides of the countenance are bounded by long spreading yellowish tufts of hair. The body and upper parts of the forearms are brownish grey, the lower portions of the arms from the elbows to the wrists being white, its hands and thighs are black and the legs of a bright red colour, while the tail and large triangular spot above it are pure white. Such a creature matches well for its grotesque and variegated appearance with the mandarin duck and gold fish also peculiar to China. Mr. Earl mentions that in the Archipelago, he saw numbers of large black apes, called luton, crowd the trees near the anchorage, about the time of low water, for the purpose of catching crabs and craw-fish which form their principal food. The natives assert that they put their long tails into the holes inhabited by the crabs, pulling them out when the latter bite. They also assert that the monkey's tails are sometimes held fast and the animal consequently drowned when the tide rises.

The monkeys of Malacca are very beautiful, having yellow hair, with a black ring round the neck. They are the most docile and intelligent of all the different species of the *Simia*: two of them on board the

MONKEY FLOWER.

Hope, with agile gambols, and highly comic, though sometimes mischievous pranks, enlivened many a heavy hour in the course of the voyage. The Singhalese have the impression that the remains of a monkey are never to be found in the forest; a belief which they have embodied in the proverb that "he who has seen a white crow, the nest of a paddy bird, a straight coconut tree, or a dead monkey, is certain to live for ever." This piece of folk lore has evidently reached Ceylon from India, where it is believed that persons dwelling on the spot where a Hanuman monkey, *Presbytis entellus*, has been killed, will die, that even its bones are unlucky and that no house erected where they are hid under ground can prosper. A white monkey taken between Ambessusse and Kornegalle, where they are said to be numerous, was brought to Colombo. Except in colour, it had all the characteristics of *Presbytis cephalopterus*. So striking was its whiteness that it might have been conjectured to be an albino, but for the circumstance that its eyes and face were black. White monkeys have been seen near the Ridigalle Wihara, in Seven Korles and also at Tangalle.

Monkeys appear to frequent regions exceeding 11,000 feet in height, the *Presbytis schistaceus*, *Hodys*, on ascending higher than others. These monkeys, called "langur" by the natives, have been frequently seen, more especially in Garhwal and Simla, at the height of 11,000 feet, 'leaping and playing about at this elevation,' as Captain Hutton says, "while the fir-trees among which they sported, were loaded with snow-wreaths. The *Macacus rhesus*, *Auleb*, is met with as well in India (particularly in Bengal and Assam) as in the Himalaya, where it frequents heights of about 8,000 feet. Turner mentions having seen a large troop of these animals in Bhutan, which are in Ceylon held in great veneration, but in Western Tibet, and farther to the north, no monkeys have yet been found.

Cynopithecus nigrescens, is the black baboon monkey of Celebes.

Rats, monkeys, and squirrels commit great depredations in fruit time: they are partial to the sweet pulp which they digest but evacuate the beans whole.—*Elliot*; *Horsf. Jerdon, Low's Sarawak*, p. 80. *Williams' Middle Kingdom*, p. 247. *Earl*, p. 116 to 117. *Watken's Voyage* p. 164. *Ten nent Skete. Nat. Hist.* p. 11-8 31. See *Simiada*.

MONOTHEISM is the primary doctrine of the Vedas.

MONSA-SIJ, *Beng.* Sheathed spurge, *Euphorbia ligularia*.

MONSON. A general who advanced against Holkar in 1804, but retreated towards Agra, deserted by his Joypore allies.

MONSOON.

<i>Mausam</i> ,	<i>Arab.</i> <i>Etesian</i> Greek from
<i>Etesian winds</i> ,	<i>Eng.</i> <i>eros</i> a year.

In Hindustan, the people usually arrange the year into three periods, the "choumase" or "Burk'ha" which is the rainy season of four months duration; after which is the "Seela" or "Jara" or "Mohasa" the cold season; followed by the Dhoo-kala or

MONSOON,

K'hursa or hot season. This division indicates generally, the course of the seasons in India, though in one locality, the rains or the hot or the cold seasons may be somewhat more prolonged than in another. The monsoons or periodical winds are known in the Indian Ocean, and indeed generally throughout India, by the name of the south-west and north-east monsoon, these being their directions at sea.

The south-west or summer monsoon, in almost all parts of India, is a sea wind, and is therefore loaded with vapour.

In Northern India the rainy season commences later than in the peninsula, because it is not till June that the sun acts sufficiently energetically on the Tibetan mountains and the plains of temperate Asia to attract in that direction the full force of the monsoon. This wind, after passing over the plains of Bengal, comes in contact with the Khasia mountains, upon which, and upon the whole chain of the Himalaya, it discharges itself in heavy rains diminishing in amount as we advance westward, with the increasing distance from the sea. At Calcutta the wind, during the whole of the monsoon, from April onwards, blows from the east to south, but after the beginning of August when the great rain-fall in eastern Bengal has considerably lowered the temperature of that province, (the arid plains of the Punjab, however remaining excessively heated) it becomes S. S. W., and in September still more easterly. After the autumnal equinox, the great mass of the Himalaya becomes intensely cold, and the whole of the continent comparatively cool, while the southern hemisphere gets powerfully heated, the monsoon is everywhere a land wind, except in the Malayan peninsula and on the coast of the Carnatic. From the vernal to the autumnal equinox a great part of India is preternaturally hot, but from October to February (inclusive) it is comparatively cool, and at the same time the continents of Africa and Australia become preternaturally hot. During the summer months therefore, or the hot season as it is commonly called in India, the wind blows from the south towards the north, while in the winter or cold season it blows from north to south. From the vernal till the autumnal equinox, the heat of a great part of India, is still however great: but after the autumnal equinox the great mass of the Himalaya becomes intensely cold and the plains of India generally become cool and when the north-east monsoon prevail, it is every where a land wind except on the coast of the Carnatic and in the Malayan peninsula. In Malaya it

MONSOON.

blows over a great extent of sea, and is therefore very rainy but in the Carnatic the width of the sea is not great, so that the rainfall, though well marked, is less, and terminates long before the end of the monsoon, probably from the wind acquiring a more directly southerly direction, after the sun has reached the southern tropic. The amount of rain varies prodigiously in different parts of India, from almost none to six hundred inches, but the rain-fall affords no direct criterion of the humidity of any climate, for the atmosphere may be saturated with moisture without any precipitation taking place. Thus, while in Sikkim 1° for 300 feet is the proportion for the elevations below 7,000 feet, on the Nilghiri Hills it is about 1° for 340 feet, in Khasia 1° for 380 feet; and elevations of Nagpur and Ambala produce no perceptible diminution in their mean temperature, which is as great as that which would normally be assigned to them were they at the level of the sea.

Monsoons prevail in the Indian Ocean, between Sumatra and the African coast, and between 3° S. L. to the Asiatic coast including the Arabian Sea, the Gulf of Bengal, and between the Island of Madagascar and coast of Africa. They are distinguished as the N. East and the S. West monsoons. Both of them bring rain, and that from the South west prevails from the latter part of May till the middle of September and is chiefly felt on the west coasts of India and Burmah and northwards towards the Himalaya. The N. East monsoon prevails from the middle of October till the middle of December and its force is chiefly felt on the Eastern coast of the peninsula of India. The countries and islands of South Eastern Asia have, thus, a wet and a dry side. The S. W. monsoon drops much of its rain on the Western Ghats of the peninsula of India and moisture brought by the N. E. monsoon is deposited principally on the eastern side of the peninsula. The South side of an island in the S. W. monsoon has one continuous shower but as the clouds spend their rain on the central mountains the North coast is quite dry. In the N. E. monsoon this is reversed.

In India and upon its seas the monsoon phenomena are developed on the grandest scales. These remarkable winds blow over all that expanse of northern water that lies between Africa and the Philippine Islands. Throughout this vast expanse, the winds that are known in other parts of the world as the N. E. trades, are here called N. E. monsoon, because, instead of blowing from that quarter for twelve months, as in other

MONSOON.

seas, they blow only for six. During the remaining six months they are turned back, as it were; for, instead of blowing towards the equator, they blow away from it, and instead of N.E. trades we have S.W. monsoons.

The S. W. monsoons commence at the north, and "back down," or work their way towards the south. Thus they set in earlier at Calcutta than they do at Ceylon, and earlier in Ceylon than they do at the equator. The average rate of travel, or "backing down to the south," as seamen express it, is from fifteen to twenty miles a day. It takes the S. W. monsoons six or eight weeks to "back down" from the tropic of Cancer to the equator. During this period there is a sort of barometric ridge in the air over this region which we may call the monsoon wave. In this time it passes from the northern to the southern edge of the monsoon belt, and as it rolls along in its invisible but stately march, the air beneath its pressure flows out from under it both ways, on the polar side as the S. W. monsoon, on the equatorial as the N. E.

As the vernal equinox approaches, the heat of the sun begins to play upon the steppes and deserts of Asia with power enough to rarify the air, and cause an uprising sufficient to produce an indrought thitherward from the surrounding region. The air that is now about to set off to the south as the N.E. monsoon is thus arrested, turned back, and drawn into this place of low barometer as the S. W. monsoon. These plains become daily more and more heated, the sun more and more powerful, and the ascending columns more and more active; the arc of intruding air, like a circle on the water, is winded, and thus the S. W. monsoons, "backing down" towards the equator, drive the N. E. monsoons from the land, replace them, and gradually extend themselves out to sea.

The S. W. monsoon commences to change at Calcutta, in 22° 34' N., in February, and extends thence out to sea at the rate of fifteen or twenty miles a day; yet these winds do not gather vapour enough for the rainy season of Cherra Ponjie, in lat. 25° 16', to commence with until the middle or last of April, though this station, of all others in the Bengal Presidency, seems to be most favourably situated for wringing the clouds. Selecting from Colonel Sykes's report of the rain-fall of India, those places which happen to be nearest the same meridian, and about 2° of latitude apart, the following statement is made, with the view of showing, as far as such data can show, the time at which the rainy season commences in the interior.

MONSOON.

	Long.	Lat.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.

* Setting in of the S. W. monsoon. † Ending of the S. W. monsoon.

MONSOON.

It appears from this table that between Calcutta and the equator the S.W. monsoons are the prevailing winds for seven months, the N. E. for five. Each monsoon, like the trade winds blows from a higher to a lower barometer. Taking up the clew from this fact, and resorting again to the graphic method for illustration, we may ascertain, with considerable accuracy, not only the relative strength of the north-east and south-west monsoons of the sea, but also the mean height of the barometer in the interior of India during the south-west monsoon, supposing that monsoon to go no farther than the mountain range, which may be taken at a mean to be about the parallel of 30° north.

The south-west monsoons—coming from the sea, carry into the interior rains for the great water-shed of India. They bear with them an immense volume of vapour, as is shown by the rivers, and confirmed by the rain-fall of Cherraponjic, and at 126 other stations. Cherraponjic is 4,500 feet above the sea level. It reaches quite up to the cloud region, and receives a precipitation of 537½ inches during the south-west monsoon, from May to August inclusive. Col. Sykes reported to the British Association, at its meeting in 1852, the rain-fall at these 127 places, which are between the parallels of 20° and 34° in India. According to this report, the southwest monsoons pour down during the three summer months upon this water-shed 29½ inches of rain. The latent heat that is liberated during the condensation of the vapour for all this rain expands the air, causing it to boil over, flow off, and leave a low barometer, a diminished atmospheric pressure throughout all the region south of the Himalaya.

There is only one north-west monsoon found in the southern hemisphere. In the northern hemisphere the north-east trade-wind blows in the China Sea and in the Indian Ocean; in the East Indian Archipelago the west monsoon prevails, and when here the south-east trade wind blows as the east monsoon.

In the Java Sea, during the month of February, the west monsoon blows strong, almost continually; in March it blows intermittently and with hard squalls; but in April the squalls become less frequent and less severe. Now the changing commences; all at once gusts begin to spring up from the east: they are often followed by calms. The clouds which crowd themselves upon the clear sky give warning of the combat in the upper air which the currents there are about to wage with each other.

MONSOON.

As the occasional showers which fall throughout the year in Britain are unknown in most Asiatic countries, the first particulars to attend to in examining their climate, are the season and the quantity of the periodical rains. It is these which regulate husbandry, and on which in many countries the temperature and succession of the seasons in a great measure depend. The most remarkable rainy season, is that called in India the south-west monsoon. It extends from Africa to the Malay peninsula, and deluges all the intermediate countries within certain lines of latitude, for four months in the year. In the south of India this monsoon commences about the beginning of June but it gets later as we advance toward the north. Its approach is announced by vast masses of clouds that rise from the Indian ocean, and advance towards the north-east, gathering and thickening as they approach the land. After some threatening days, the sky assumes a troubled appearance in the evenings and the monsoon in general sets in during the night. It is attended with such a thunder-storm as can scarcely be imagined by those who have only seen that phenomenon in a temperate climate. It generally begins with violent blasts of wind, which are succeeded by floods of rain. For some hours lightning is seen almost without intermission, sometimes it only illuminates the sky, and shows the clouds near the horizon; at others it discovers the distant hills, and again leaves all in darkness, when in an instant it re-appears in vivid and successive flashes, and exhibits the nearest objects in all the brightness of day. During all this time the distant thunder ceases to roll and is only silenced by some nearer peal, which bursts on the ear with such a sudden and tremendous crash as can scarcely fail to strike the most insensible heart with awe. At length the thunder ceases and nothing is heard but the continued pouring of the rain, and the rushing of the rising streams. The next day presents a gloomy spectacle; the rain still descends in torrents, and scarcely allows a view of the blackened fields; the rivers are swollen and discoloured and sweep down along with them the hedges, the huts, and the remains of the cultivation which was carried on, during the dry season in their beds. This lasts for some days, after which the sky clears, and discovers the face of nature changed as if by enchantment. Before the storm the fields were parched up, and, except in the beds of the rivers, scarce a blade of vegetation was to be seen; the clearness of the sky was not interrupted by a single cloud, but the atmosphere was loaded with

MONSOON.

dust, which was sufficient to render distant objects dim as in a mist and to make the sun appear dull and discoloured, till it attained a considerable elevation; a parching wind blew like a blast from a furnace, and heated wood, iron, and every other solid material, even in the shade; and immediately before the monsoon, this wind had been succeeded by still more sultry calms. But, when the first violence of the storm is over, the whole earth is covered with a sudden but luxuriant verdure; the rivers are full and tranquil; the air is pure and delicious; and the sky is varied and embellished with clouds. The effect of the change is visible on all the animal creation, and can only be imagined in Europe by supposing the depth of a dreary winter to start at once into all the freshness and brilliancy of spring. From this time the rain falls at intervals for about a month, when it comes on again with great violence, and in July the S.W. rains are at their height; during the third month they rather diminish, but are still heavy; and in September they gradually abate, and are often entirely suspended, till near the end of the month; when they depart amidst thunders and tempests as they came. Such is the S.W. monsoon in the greater part of India. It is not, however, without some diversity, the principal feature of which is the delay in its commencement, and the diminution in the quantity of rain, as it recedes from the sea. No trace of it can be perceived at Candahar. The north-east of Afghanistan, although much further from the sea than Candahar, is subject to the S.W. monsoon, and what is equally extraordinary receives it from the east. These anomalies may perhaps be accounted for by the following considerations. It is to be observed, that the clouds are formed by the vapours of the Indian ocean, and are driven over the land by a wind from the south-west. Most part of the tract in which the kingdom of Cabul lies, is to leeward of Africa and Arabia, and receives only the vapours of the narrow sea, between its southern shores and the latter country, which are but of small extent, and are exhausted in the immediate neighbourhood of the coast. India lying further east, and beyond the shelter of Africa, the S.W. monsoon spreads over it without any obstruction. It is naturally most heavy near the sea from which it draws its supplies, and is exhausted after it has past over a great extent of land. For this reason, the rains are more or less plentiful in each country, according to its distance from the sea, except in those near high mountains, which arrest the clouds, and

MONSOON.

procure a larger supply of rain for the neighbouring tracts, than would have fallen to their share, if the passage of the clouds had been unobstructed. The obstacle presented to the clouds and winds by the mountains is another effect of no small importance. The south-west monsoon blows over the ocean in its natural direction, and though it may experience some diversities after it reaches the land, its general course over India may still be said to be towards the north-east till it is exhausted on the western and central parts of the peninsula. The provinces in the north-east receive the S.W. monsoon in a different manner; the wind which brings the rains to that part of the continent, originally blows from the south-west, over the Bay of Bengal, till the Himalaya mountains, and those which join them from the south, stop its progress, and compel it to follow their course towards the north-west. The prevailing wind therefore, in the region south-west of the Himalaya, is from the south-east, and it is from that quarter that the provinces in Bengal receive their rains. But when the wind has reached so far to the north-west as to meet with the Hindoo Coosh, it is again opposed by that mountain, and turned off along its face towards the west, till it meets the projection of Hindoo Coosh and the Soliman range, which prevent its further progress in that direction, or at least compel its clouds to part with the moisture with which it was loaded. The effect of the mountains in stopping the clouds borne by this wind is different in different places. Near the sea, where the clouds are still in a deep mass, part is discharged on the hills and the country beneath them, and part passes up to the north-west; but part makes its way over the first hills, and produces the rains in Tibet. In the latitude of Cashmere, where the clouds are considerably exhausted, this last division is little perceived; the southern face of the hills and the country still farther south is watered; and a part of the clouds continue their progress to Afghanistan; but few make their way over the mountains or reach the valley of Cashmere. The clouds which pass on to Afghanistan are exhausted as they go; the rains become weaker and weaker, and at last are merely sufficient to water the mountains without much affecting the plains at their base. The above observations will explain, or at least connect, the following facts connected with British India. The south-west monsoon commences on the Malabar coast in May, and is there very violent; it is later and more moderate in Mysore; and the Coromandel coast, covered by the mountainous countries on its west, is entirely ex-

MONSOON.

empt from it or only receives it in the form of small showers. Further north, the monsoon begins early in June, and loses a good deal of its violence, except in the places influenced by the neighbourhood of the mountains or the sea, where the fall of water is very considerable. About Delhi, it does not begin till the end of June, and the fall of rain is greatly inferior to what is felt at Calcutta or Bombay. In the north of the Panjab, near the hills it exceeds that of Delhi; but in the south of the Panjab, distant both from the sea and the hills, very little rain falls. The countries under the hills of Cashmere, and those under Hindoo Coosh viz. Pakhlee, Booner, and Swat, have all their share of the rains; but these diminish as we go west, and at Swat are reduced to a month of clouds, with occasional showers. In the same month, the end of July and beginning of August, the monsoon appears in some clouds and showers at Peshawar, and in the Bungush and Khuttuk countries. It is still less felt in the valley of the Cabul river, where it does not extend beyond Lughmann; but in Bajour and Panjcora, under the southern projection, in the part of the Kafir country, which is situated on the top of the same projection, and in Teera, situated in the angle formed by Tukht-i-Soliman and its eastern branches, the south-west monsoon is heavy, and forms the principal rains of the year. There is rain in this season in the country of the Janjee and Toree, which probably is brought from the north by eddy winds: but whether that which falls in Bunnoo and the neighbouring countries is to be ascribed to this cause or to the regular monsoon from the southwest is uncertain. The regular monsoon is felt as far west as the utmost boundary of Mekran; it is not easy to fix its limits on the north-west with precision, beyond a line drawn through the northern part of the table land of Kelat and the northern parts of Shoranbuk, of Pisheen, and of Zhobe to the source of the Koorum; it falls, however, in very different quantities in the various countries south-east of that line. The clouds pass with little obstruction over Lower Sind, but rain more plentifully in Upper Sind and Domann, where these rains, though not heavy, are the principal ones in the year. On the sea coast of Lus and Mekran, on the other hand, they are arrested by the mountains, and the monsoon resembles that of India. In Sewestan the monsoon is probably the same as in Upper Sind and Domann; in Boree it is only about a month of cloudy and showery weather; it is probably less in Zhobe; and in the

MONSOON.

other countries within the line it only appears in showers, more precarious, as we advance toward the north.

The second rain of Afghanistan to be noticed, is that which falls in winter and which assumes the form of rain or snow, according to the temperature of the place; it extends over all the countries west of the Indus as far as the Hellespont, and is of much greater importance to husbandry than the south-west monsoon, except in the few districts already specified; it is indeed the most considerable rainy season in all the countries except those included in India; it even appears in India but only lasts for two or three days about Christmas and though of some importance to the cultivation cannot always be relied on. Where it falls in the form of snow, it is the most important to agriculture, but where it falls as rain it is less so than that of the spring; the inferiority of the quantity of the latter being more than compensated by the opportuneness of its fall.

The spring rain of Afghanistan generally falls at different times during a period extended in some places to a fortnight and in others to a month; it extends over Afghanistan, Turkistan. In most parts of India, some showers fall at the same season, and delay the approach of the hot winds but have little effect on the cultivation. In other countries it is of the utmost consequence to husbandry, as it falls at the time when the most important crop is beginning to appear above the ground. Both this and the winter rain are said to come from the west.

The climate of Afghanistan varies extremely in different parts of the country. This is in some measure attributed to the difference of latitude, but still more to the different degrees of elevation of different tracts. The direction of the prevailing winds also materially affects the climate; some blow over snowy mountains, others are heated in summer, and rendered cold in winter, by their passage over deserts and other arid tracts of great extent; some places are refreshed in summer by breezes from moister countries, and some are so surrounded with hills as to be inaccessible to any wind at all.

The sun's rays evaporate from the Bay of Bengal, water enough to feed with N. E. rains, the western shores of this bay, and the ghauts range of mountains. This range holds the relation to these winds that the Andes of Peru hold to the south-east trade-winds, it first cools, and then relieves them of moisture, which they tumble down on the western slopes of the ghauts.

The south-west monsoon comes from the

MONTES MARITHI.

Southern Ocean and is loaded with vapour. It passes over the plains of Bengal, and strikes on the Khasya mountains and the whole line of the Himalaya, discharging itself in heavy rains. From April till August it blows from the east of south, in August S. S. E. and September more easterly lowering the temperature of Bengal and of the northern plains though the plains of the Punjab continues excessively heated.

The south-east winds from the Indian Ocean and the Arabian Sea, on the other side of Hindoostan (which would be, of course, the south-west wind and south-west monsoon), after deluging the ghanta, proceed as dry winds to the Himalaya, in crossing which they are subjected to a lower temperature than that to which they were exposed in crossing the ghanta. Here they drop some of their moisture in the shape of snow and rain, and then pass over into the thirsty lands beyond with scarcely enough rain in them to make even a cloud. Thence, they descend into the upper air, there to become counter-currents in the general system of atmospheric circulation.

At the close of the S. W. monsoon, Java and the Archipelago, and Ceylon and India send out vessels to the Red Sea, laden with rice, sugar, indigo and cotton stuffs, and the Persian Gulf sends dates, corn, Shiraz tobacco, and from Africa come slaves, ostrich feathers, coffee, musk, gold, dust, drugs and gums.

The S. W. monsoon, rages throughout Coorg from June to November, but is scarcely felt at Fraserpet, one of the Coorg towns, and on this account the European and Native officials reside there during the wet season, returning to Mercara so soon as the monsoon ceases.

The N. E. monsoon prevails from October to April after which the great arid plains of Central Asia, of Tartary, Tibet and Mongolia, become heated up and draw upon them the atmospheric current which form the S. W. monsoon. — *A. S. Bickmore, Travels* p. 298, *Mauzy's Physical Geography* pp. 372, 383. *Elphinstone's Caubul*, Vol. I Chap. V p. 203. 2nd Edition London 1819.

MONT, HIND. Nima quassioides.

MONTARAN ISLANDS, lying off the north-east part of Billiton, consist of three straggling groups.

MONTESIDSI or Monic tribe, north of the desert, occupy all the country from Korne to Arjje, on both sides of the Euphrates, they migrate to summer and winter quarters.

MONTES PARVATI. See Kali.

MONTES MARITHI of Ptolemy, the present Nejd ul Arad.

MONTH.

MONTGOMERY, a district in the Punjab, producing grain of all kinds, cotton, wool, ghee, hides, tobacco, ruggies and camels. The chief products of the Rawulpindee district are grain of all kinds, cotton, wool, ghee, opium in small quantities, soap, jars of hide, oil, blankets, cotton cloth, sugar, tobacco, flax, and potatoes. — *Ann. Ind. Adm.* Vol. xii 109.

MONTGOMERY, Sir Henry Conyngham, Bart., of the Indian Council, was Secretary to the Government, and Member of the Council, at Madras, served in many high posts with credit. He is the eldest son of the late Sir H. C. Montgomery, Bart., an officer of high distinction in the war with Tippoo Saib, and afterwards Inspecting Field Officer of Yeomanry and Volunteers in the county of Donegal, and sometime M. P. for the boroughs of Yarmouth and Saint Michael's. He was born in 1803, and succeeded to his father's title in 1830. He married in 1826, Leonora, daughter of General Pigot. Sir Henry Montgomery was formerly on the staff in Ireland, and represents a branch of the family of the Earl of Eglinton who settled two or three centuries ago in the north of Ireland and, by sustaining the English interest there, obtained large grants of land in Down, Donegal, Carmanagh, Monaghan, and Cavan. On the transfer of the Indian empire from the East India Company to the Crown of Great Britain and the formation of an Indian Council Sir Henry Montgomery was chosen as one of the Councillors.

MONTGOMERY, Sir Robert, a Bengal Civil Servant, who distinguished himself during the Indian revolt of 1857 and afterwards served as Commissioner of the Punjab; during his administration, there were steady and progressive measures of improvement.

In the south and east of Asia the races occupying the various countries divide the year into months, but some reckon by the lunar periods and some by the solar changes. The hindus farther divide the month into two portions called pakh, or fortnights. The first is termed badi, reckoning from the 1st to the 15th, which day of partition is called amavasy, answering to the idea of the Romans, and held by the hindus, as it was by the Jews in great sanctity. The last division is termed Sudi, and they recommence with

MONTH.

the initial numeral; thence to the 30th or completion, called poonum; thus, instead of the 16th, 17th, &c. of the month, they say Sudi ekum (1st) Sudi doag (2nd). The mahomedans of Arabia, Persia and India, following the lunar changes, divide their year into twelve months. viz.

- | | |
|--------------------------|------------------|
| 1. Moharram. | 7. Rajab. |
| 2. Safar. | 8. Shaban. |
| 3. Rabi-ul-awal. | 9. Ramazan. |
| 4. Rabi-ul-akhir, also | 10. Shawal. |

| 5. Jamadi-ul-awal. | 12. Zu-ul-hajja, |
| 6. Jamadi-ul-akhir, also | |
| -us-sani. | |

The mahomedans, like most others, have weeks of seven days, called shambah. The following are the Persian names of the days. Ek-shambah...Sunday. Pañj-shambah Thursday. Do-shambah...Monday. Adna or Jumma...Fri. Si-shambah...Tuesday. Shambah...Saturday. Char-shambah...Wednes.

The Arabs distinguish their days or yom as first, second, third, and the mahomedan in British India, use terms partly of Arabic, partly of Persian, and partly of Sanscrit origin; Aitawar...Sunday. Jumarat...Thursday. Pir...Monday. Juma...Friday. Mangal...Tuesday. Haftah, or Awal Haftah, Char-shambah...Wednes. Saturday.

The following races designate the months of the year by terms derived from one source;

MOOG.

MONTRES. FR. Watches.

MOOA. BENG. *Bassia longifolia*.—Willd.

MOOBARIZ KHAN. A ceremony.

MOOBARKHA.—P Ferns.

MOOCHEE, a hindoo caste, in Bengal, shoemakers, or saddlers: in the Dekkan, painters, book binders, saddlers, &c.

MOOCHEE-WALAY, Moochees Wanloo, or Moocheemen, Shoemakers.

MOOCHEE-RAS. HIND. A resin from the *Salmalia Malabarica*; its roots constitute the safed moosli of the bazaars, which, powdered, forms a thick mucilage with cold water, and answers admirably as a nutritious demulcent for convalescent persons; in Bombay, the term Moochi ras is also given to a kind of gall produced in the *Areca catechu*; and it is said also to be applied to the gum of the *Moringa pterygosperma*.

MOOCHOO MARAM. TAM. *Erythrina Indica*.—*Lam. Roeb. W. & A.*

MOOCHWAL, or whiskered, a name of Abra. See *Abra. Kattyawar*.

MOOCHY WOOD TREE. ENG. *Erythrina Indica*.—*Lam. Roeb. W. & A.*

MOOCHKOONDA. BENG. *Oclina squarrosa*.

MOOCTA-JOOREE. BENG. HIND. *Acalypha Indica*.

MOODACATHAN. *Cardiospermum halicacabum*.

MOODALI. TAM. Moodliar plural, literally first man, first men, honorific terms applied to the men of the Vellalar or agricultural race, amongst the Tamil people. The term Pillay is similarly applied to the Idayan or shepherd race dwelling in the Tamil country.

MOODGU. BENG. *Phaseolus mungo*.

MOODKEE, a town in the neighbourhood of Ferozepoor in the Punjab.

MOODOOTA OIL. The seeds of *Butea frondosa* yield a small quantity of this bright clear oil, which is sometimes used medicinally.—*M. E. J. R.*

MOODUWIR. AR. A circle, implying repetition, from the Arabic word *Dair*.

MOODU-WARU. SINGH. *Calotropis gigantea*.—*Brown*.

MOODORIKA. SANS. *Foniculum panmori*.—*D. C.*

MOODRA. HIND. A round prickly seed worn by the hindu ascetics as earrings. The Kan Phatta Jogi wear a large metal earring. The Jogi's putera is a hollow gourd; that of the divinity Hari (the god of war) is the human cranium.—*Fraser's Journey into Khorasan*, p. 394. *Wilson Tr. of Hind. Vol. i.*, p. 43. *Tod's Rajasthan*, Vol. ii. p. 236. *Wilson's Gloss; Wilson's Hindoo Sects*.

MOOG. BENG. Small fruited bean or green gram, *Phaseolus mungo*. See Moong.

MOOKHIA.

MOOGALI MARA. CAN. *Mimusops elengi*.
MOOGDHA-BODHA. SANS. From moog-dha, stupidly ignorant, and bodha, knowledge.

MOOGL. An. *Commiphora madagascariensis*, properly Muql.

MOOGRA. *Jasminum undulatum*, Linn. the many leaved jessamine.

MOOJAWIR, a proprietor or landlord; a sweeper of an Ashoor-khausa or one attached to a mosque.

MOOKARATAY—? *Boerhavia procumbens*.

MOOKASSIMAH. See Khiraj.

MOOKERSEY? TAM. In Tinnevely, a wood of a red color, used for building in general.—*Colonel Prith.*

MOOKHIA, a comptroller, appointed to collect tribute to hindu idols. Sacred offerings were held in high estimation by the nations of antiquity. Herodotus observes that these were transmitted from the remotest nations of Scythia to Delos in Greece; but that range is far less extensive than the offerings to the dewal or temple of Krishna in Mewar. The spices of the isles of the Indian Archipelago; the balmy spoils of Araby the blest; the nard or frankincense of Tartary; the raisins and pistachios of Persia; every variety of saccharine preparation, from the sacarcand (sugar-candy) of the Celestial empire, with which the god sweetens his evening repast, to that more common sort which enters into the pera of Mat'hura, the food of his infancy; the shawls of Cashmir, the silks of Bengal, the scarfs of Benares, the brocades of Guzerat, the flower and choice

"Of many provinces from bound to bound,"

all contribute to enrich the shrine of Nat'hdwara in Mewar. But it is with the votaries of the maritime provinces of India that he has most reason to be satisfied; in the commercial cities of Surat, Cambay, Muscat, Mandavi, &c. &c., the Mookhia, or comptrollers deputed by the high-priest, reside, to collect the benefactions, and transmit them as occasion requires. A deputy resides on the part of the high-priest at Mooltan, who invests the distant worshippers with the initiative cordon and necklace. Even from Samarkand the pilgrims repair with their offerings; and a sum, seldom less than ten thousand rupees, is annually transmitted by the votaries from the Arabian ports of Muscat, Mocha, and Jedda, which contribution is probably augmented not only by the votaries who dwell at the mouths of the Volga, but by the Samoyede of Siberia. There is not a petty retailer professing the Viahnu creed, who does not carry a tithe of his trade to the stores: and thus caravans of thirty and

MOOLA PASS.

forty cars, double-yoked, pass twice, or thrice annually by the upper road to Nat'hdwara. These pious bounties are not allowed to moulder in the bindar: the apparel is distributed with a liberal hand as the gift of the deity to those who evince their devotion; and the edibles enter daily into the various food prepared at the shrine.—*Tod's Rajasthan*, Vol. i. p. 527 to 529.

MOOKOOROO KARRA. TEL. *Cordia myxa* Linn. Roxb.

MOOKOOTTY.—? *Boerhavia repanda*.

MOOKTAD, a Parsee ceremony in honour of the dead, evidently copied from the hindoos, and performed at the end of the Parsee year, before a pile of metal vessels filled with water, and raised from the ground on iron stools.

MOOKTA KESHI, SANS, from mookta, spread out, keshha, hair.

MOOKTA-RAMA; SANS. Mookta, liberation.

MOOKTO-PATEE BENG. HIND. *Maranta dichotoma*.

MOOKTA-JOORI, BENG. *Acalypha Indica*.

MOOK-WA, a tribe of fishermen in Malabar. See Polyandry.

MOOLA, BENG. *Raphanus sativus*.

MOOLA BENG. HIND. *Bassia latifolia*.

MOOLA, see Sutti.

MOOLA. A river of Beluchistan, about 150 miles long, rises a few miles S. of Kelat, runs South-easterly, about 80 miles; north-easterly; and easterly and is ultimately absorbed in the desert of Shikarpore. The Moola or Gundava Pass winds along its course.

MOOLA PASS or Gundava Pass of Cutch Gundava, in Lat. 28° 10,' lon. 66° 12'; to lat. 28° 24,' lon. 67° 27' is about 100 miles long it has open spaces, connected by defiles. Bapow, is 5,250 ft.; Peesee Bhent, 4,600; Nurd, 2,850; Bent-i-Jah, 1850; Kullar, 750 ft. Descent, 4,650 ft., average 46 ft. per mile. Water abundant. Practicable for artillery. In 1839, an Anglo-Indian detachment marched through it. It is preferable to the Bolan Pass in a military point of view. The Moola is the southern pass through the mountains of Saharawan near Gundava. The height of the Saharawan range varies. The greatest altitude is attained at Kelat, about 7,000 feet, where the climate is European; southward it rapidly decreases, until, in the province of Lus, the elevation is but a trifling degree greater than that of Sind. It decreases also northward, the height of Quetta being about 5,900 feet. This elevated district is composed of a succession of mountain ranges, which, rising

MOOLTAN.

from the plains of Kutchee and valley of the Indus, tower one above the other in successive steps, until, having gained their maximum, they subside in lesser and lesser ranges westward. Their general direction is from N. N. E. to S. S. W., and this uniformity of strike is wonderfully preserved throughout. The mass is broken through at two points, viz: by the Bolan pass at its northern extremity, and by the Moola pass near Gundava. Here the ranges are twisted out of their original direction, and run in a N. N. W. manner. Through these two great channels the principal draining of the country is effected, producing the Bolan and Mobla rivers. It was through this pass that Craterus travelled, when he left the army of Alexander.

MOOLI, a river that joins the Moota near Poonah, forming the moota-mooli river.

MOOLA. HIND. A root.

MOOLAY KIRAY. TAM. Toddalia aculeata.

Rajghire ki baji,	DUK.	Molay Kiray,	TAM.
Chulai,	HIND.	Malakura,	TEL.
Shakini,	SANS.		

MOOLI. HIND. A radish. Raphanus sativus; any root. To call a mahomedan a garden root, aa tum kon sa bugh ki mooli-ho, of what garden are you a root, is very offensive.

MOOLHID-NOOMA. PERS. resembling infidels.

MOOLLAH. ARAB. amongst mahomedans, a doctor or learned man; in Persia, the Moolah wears a large turban of white muslin; and a synd, in whose veins runs the prophet mahomed's blood, a smaller turban of dark green stuff.

MOOLLAH NAJEEB. See Kush.

MOOLLOO-VENGA. Briedelia spinosa.

MOOLTAN, is a large trading city, the capital of a province of the same name in the

MOOMIYAI.

Panjab. It is built near the left bank of the Chenab, in L. 30° 9' N. and L. 71° 7' east. The Mooltan district is, on the whole, an arid, sandy country, about 110 miles in length and 70 in its greatest breadth, and is comprehended between the Sutlej, there named the Gharra, the Ravi and Chenab. Mooltan and Tatta were the ancient seats of the ancient Balla or Balli-ka-putra race, and to the present the blessing or byrd of the bards is Tatta-Multan ka Rao. At an interval of 1300 years, two conquerors, Alexander and Mahmud, were opposed by a race of this name. In A. D. 1000, Mahmud entered Hindustan but in the course of eight years, he made no further progress than Mooltan. The people of Mooltan, who were the Malli, and Catheri (that is the Khatry or Rajpoot tribe) of Alexander, must have preserved their ancient spirit, to be able to oppose, for so long a time, such formidable armies headed by so furious an enthusiast as Mahmud. In 1008, we find the confederate hindoos defeated, and Mahmud's first essay towards effecting the downfall of their religion, was the destruction of the famous temple of Nagarkot, in the mountains bordering on the Panjab country. His next expedition, being the sixth, was in 1109; when Tannassar, a more celebrated place of hindoo worship, on the west of Delhi, experienced a like fate with Nagarkot; and the city of Delhi itself, was taken at the same time. In 1018, he took Kanoj, and also destroyed the temples of Matra, or Matura (the Methora of Pliny). His twelfth expedition, in 1021, was fatal to the celebrated temple of Somnaut, in the peninsula of Guzerat adjoining to the town of Puttan, on the sea coast; and not far from the island of Diu, now in the hands of the Portuguese. Mooltan city was taken by storm by the British Indian Army on the 2nd January 1849. The chief products of the Mooltan district consist of cereals, cotton, indigo, sugarcane, saltpetre, alkali or anjee, ghee and wool; some of which commodities are also largely imported from other places, the surplus of wheat finds its way to Sukkur and Kurachee.—*Ann. Ind. Adm. Vol: XII p. 106 &c., 10, Rennell's Memoir p. 14.* See Katti; or Kattaywar.

MOOLUK. BENG. Radish, Raphanus sativus.

MOOLU VENGA. TAM. In Travancore, a wood of a copper colour, specific gravity 0.831. Used for common buildings. *Colonel Frith.*

MOOMIYAI. PERS. a kind of petroleum, which the Persians believe to possess great

MOON.

medicinal virtues, and to be highly efficacious in mending broken bones. **MOOMOOD**, **HIND.**, made at Kohat, is of the kind called **moonia madani**, or mummy of the mine. **Elphinstone** says it is made from a mineral which is reduced to powder and boiled in water, an oil floats on the top, which hardens into a substance of the appearance and consistence of coal. It is a famous medicine throughout all the East, and is said to effect almost miraculous cures of fractures. *Elphinstone, Kingdom of Caubul* p. 40. See **Momia**.

MOOMOOKSHOOTWA, **SANS.** from **mooch**, to liberate.

MOONDUN, **HIND.** A mahomedan rite of shaving the child's head on the 6th or 40th day after birth.—*Herklots*

MOONKIR and **Nakir**, according to mahomedan belief, two angels who question the dead on their interment, as to their good and bad actions in life.

MOON.

Moud; moonat,	G.M.	Nellah,	TAM.
Chand,	HIND.	Vennil,	TEL.
Luna,	IT. LAT. SP.	Ail,	TURK.

In hindoo mythology, the moon is fabled to have been married to the twentyseven daughters of the patriarch **Daksha**, or **Aswini**, and the rest, who are in fact personifications of the lunar asterisms. His favourite amongst them was **Robini**, to whom he so wholly devoted himself as to neglect the rest. They complained to their father, and **Daksha** repeatedly interposed, till, finding his remonstrances vain, he denounced a curse upon his son-in-law, in consequence of which he remained childless and became affected by consumption. The wives of **Chandra** having interceded in his behalf with their father, **Daksha** modified an imprecation which he could not recall, and pronounced that the decay should be periodical only, not permanent, and that it should alternate with periods of recovery. Hence the successive wane and increase of the moon. **Robini**, in astronomy, is the fourth lunar mansion, containing five stars, the principal of which is **Aldebaran**. **Hindoo**s have long been aware of the astronomical facts of the moon's deriving its light from the sun, and by its positions forming the days of the lunar month, on which particular ceremonies are to be observed. In the latter case it is supposed to move in the **Mandala**, the sphere or orbit of the sun, and when in conjunction, as at the new moon or **Amavasya**, funeral obsequies are especially to be celebrated. According

MOONAGA KOORA.

to mythological notions, also, the moon is the grand receptacle and storehouse of **amrit** or ambrosia, which it supplies during the fortnight of its wane to the gods, and on the last day to the **Pitri** or deified progenitors. As personified, in hindooism, the moon is the father of **Badha** and grandfather of **Puravasa**, as already shewn. The half-moon, as frequently noticed, is worn by **Siva** upon his forehead. With the **Rajpoots**, as with the **Scandinavians**, the moon is a male divinity. The **Tatar** nation also considered him a male divinity, like **Adonia**. The moon has, in many nations, been considered to exercise an influence on the body, producing and modifying diseases, and has played an important part in the development of the character of nations and in determining the destinies of the human race. New moons, and full moons and moonless heavens at the conjunction have been kept with ceremonies or fastings. Eclipses whether of the sun or moon have been looked on as evidences of divine displeasure, the influence of the moon on marriage and child bearing was considered great. According to **Egede**, the **Greenlanders** believe that the moon visits their wives now and then; and that staring long at it, when at its full will make a maid pregnant. Amongst the **Jews**, according to **Rabbi Abravanel**, the full moon was believed to be lucky and the other phases disastrous, and the belief of the **Greeks** and **Romans** was similar. The day of the full moon was by the **Greeks** the best for marriage. **Hesiod**, **Aristotle**, **Lucilius**, **Horace**, **Pliny**, **Galen**, **Lord Bacon** and others have all made similar notices. *Winflow on Light.—Padma Purana Swerga Khanda Section 11. Hindu Theatre Vol. I pp. 229, 234. Tod's Rajasthan Vol. I. p. 598.*

MOON, **JAP.** a crest, or arms, of which the **Japanese** are as proud as any **European** noble. It is worn on their dresses, their armour, before their gateways and wherever it can be seen: before the Government-house there is generally spread a grass-tree or linen-cloth, which means "No admittance except on business:" the "moon" or crest has much the appearance of a clover leaf, and is the "moon" of government. *Hodgson's Nagasaki*, p. 16; 22.

MOON, author of a catalogue of indigenous and exotic plants growing in **Ceylon**. It is a bare list of names.

MOON-ECLIPSE—**la-kyat-hgying**. **Burm.**
MOONACANI-MARAM, **TAM.** *Toddalia aculeata*.

MOONAGA KOORA, **TEL.** the greens of *Hyperanthera moringa*. **Moonga Poo**, **TEL.** the flower of *Hyperanthera moringa*.

MOONGNEE.

Moonaga Veru, TEL. the seed of *Hyperanthera moringa*.

MOONAY, HIND. *Premna integrifolia*.

MOONDA, a head man of the Munda or Ho race. See Kol; Munda.

MOONDARI. See Kol.

MOONDASA, a cloth worn by the poorer classes in Dharwar, costs one and a quarter rupees.

MOONDEE, BENG. *Sphœranthus mollis*.

MOONDEEGUL. See Kush.

MOONDI, HIND. *Sphœranthus mollis*.

MOON-DIEN, BURM. A fine grained, light wood, recommended for furniture. Its breaking weight is lbs. 121. A cubic foot weighs lbs. 33 to 38. In a full grown tree on good soil the average length of the trunk to the first branch is 59 feet and average girth measured at 6 feet from the ground is 10 feet. It sells at 4 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ez. of 1862.*

MOONDLA MOOSTEH-KURA, TEL. *Solanum trilobatum*.

MOONDRI PALLAM, TAM. See Mundri pallam.

MOONDU, MALEAL, a cloth given to a nair woman betrothed to a single man. See Polyandry.

MOONDUN, HIND. A mahomedan rite of shaving the child's head on the 6th or 40th day after birth.—*Herklots.*

MOON-FLOWER, ENG. *Calonyction grandiflorum*, *Choisy*. It is

—"the white moon-flower, such as shows
On Serendib's high crags, to those
Who near the isle at evening sail,
Scenting her clove trees in the gale"—*Mason.*

MOONGAY, BENG. HIND. *Hyperanthera moringa*.

Moongay ki-jar, its root.

Moongay ki-baji its leaves.

Moongay ki phallo, its pods.

Moongay ka phool its flowers.

MOONGAL, TAM. *Bambusa*. The Bamboe.

MOONG AROOD, HIND. *Phaseolus mungo*, Green Gram. This is grown throughout British India but more in the upper part of Hindoostan; it is eaten by the natives dressed in various ways.—*Jaffrey.*

MOONGEE, a river near the Khassyah hills.

MOONGHIL, SANS. TAM. *Bambusa arundinacea*.—*Roxb.*

MOONG-KA-DHAL, HIND. *Phaseolus mungo*. See Dal.

MOONGNEE, of Orissa, apparently a chlorite slate: when freshly quarried, it is comparatively soft and easily workable, but by long weathering becomes highly in-

MOONSTONE.

durated, black and bright. It comes from the hill state of Nilgiri, in Orissa, where extensive quarries are said to exist. This stone is used principally for the manufacture of various utensils. Idols are also made of it, and if the popular assertion that it is the true Moongnee be accepted, this stone is that on which the finest specimens of native sculpture extant in the province are executed, to wit, the Aroon Khumba, a polygonal column of considerable grace and beauty now standing before the principal entrance of the Pooree temple; also the elaborately carved and figured slabs that adorned the top and sides of the door-ways of the old temple of the Luwat-Kanarac, in the same district and the gigantic figures of certain native deities of Jaipore, in the Cuttak district. It is probable, however, that 'Moongnee' is a general term not confined to one species of stone, but applying to several, and that the Kharee moonnee means the slate Moongnee. *Cal. Cat. Ez. 1872.*

MOONG PHALLI, HIND. *Arachis hypogæa*, Earth-nut, Ground nut; Manilla nut, the legumes contain the nuts; they are small and white, and require to be roasted before eaten; they are not in much esteem.—*Riddell.*

MOONI or *Modooga*, TEL. also *Mooni motaga*. TAM. *Erythrina suberosa*.

MOONJA, HIND. *Saccharum moonja*, a grass indigenous to India, it is collected after the rainy season, it is possessed of great tenacity, and is employed for tying up cattle at night, for ropes for the Persian wheels: the Benares boat-men make tow ropes of it, the boatmen of the Indus universally employ the Moonja as a towing rope, and for the rigging of their vessels, in all places above Sukkur. It would form an ample supply of half stuff for paper makers.—*Royle.*

MOONJUR, BENG. *Hedysarum orbiculatum*.

MOONKIR and *Nakir*, according to mahomedan belief, two angels who examine the spirits of the departed in the tomb. See Jibreel.

MOONLIGHT. The sun shall not smite thee by day, nor the moon by night, (Psalm cxxi. 6). Eastern races believe firmly in the evil effects of moonlight upon the human frame; from Sindh to Abyssinia, the traveler will hear tales of wonder concerning it.

MOONLIGHT CONVULVULUS. *Convolvulus dianeæ*.

MOONSHEE, HIND. A secretary; a teacher, the celestial Mercury, also the Eternal, the Almighty.

MOONSTONE occurs in Ceylon. It is a

MOORCROFT.

variety of felspar, and of little value. Some of the "cat's eyes" that are brought for sale by the Ceylonese, are made of adularia or moon-stone, a variety of felspar found in Ceylon resembling opal. In Europe, Moonstone is often sold for opal.—*Mason.*

MOONTHA-MAMEDY NUNA. TEL. also Moonthericotta-yeunai. TAM. Oil of *Anacardium occidentale*.

MOONUGA. HIND. Species of raisins.

MOONYAH JO RUSSA. SIND. Rope of *Saccharum munja* fibre. See *Graminaceae, munja*; *mo-nja*.

MOOR, a term by which the mahomedans of the south of India were known, all through the 18th and to the middle of the 19th century. In the Hindustani dictionary by Captain Robuck in 1813, that language was styled the Jargon of the Moors.

MOOR, Major, an officer of the Bombay Army, who was present at Seringapatam. He wrote *Oriental Fragments*; *Hindoo Panthoon*.

MOORAGA CHETTOO. TEL. *Hyporanthra moringa*.

MOOROOGANA. CAN. A butter or solid oil of Canara, used for medicinal purposes, and as an ointment for the wounds of cattle injured by tigers. It is said to be produced from a forest tree growing in the Canara jungles. The oil is dark brown and quite solid, and merits the best consideration. It is the most solid of the solid oils.

MOORAIGIBBA—? contemplating the deity with the head bowed down between the knees.

MOORATIB. AR. HIND. PERS. insignia of rank. Vide *Mahi*.

MOORBA, BENG. *Sauseviera roxburghiana*.

MOORCH 'HUL, a fan for driving away flies, especially of peacock's feathers. A club-like fan, made of peacocks feathers, used by the great.—*Herklots*.

MOORCROFT, WILLIAM, a veterinary surgeon of the Bengal army who travelled in Central Asia, and after some days illness died at Audkhui. He lies interred outside the walls of Balkh. Author of *Journey to lake Manasarovara, in Little Thibet*. A cold permission was Mr. Moorcroft's only incitement beyond the stimulus of a speculative mind and an enterprising disposition. His first attempt, which was made by way of Chinese Tartary, has been long the property of geographers, having been published in the twelfth volume of the *Asiatic Researches*. In this journey he was the first European to cross the Himalaya, and he made his way to the great plain between that and the Kuen-lun chain, the situation of the sources of the Indus and the Sutlej, and

MOORCROFT.

of the two remarkable lakes of Ravan and Manasa. Besides the natural difficulties of the way, he had to elude the vigilance of the Nepalese, then masters of the Himalaya, and who were on the eve of that war with the British which transferred the snowy mountains to the latter. Mr. Moorcroft had also to conciliate the Chinese authorities beyond the Himalaya, and in spite of all obstacles, and of sickness, induced by exposure and fatigue, he accomplished his purpose, ascertaining not only the valuable geographical facts alluded to (the situation of the sacred lakes of the Hindus, and the upper course of two important rivers), but the region, also, of the shawl-wool goat, and opening a way for the importation of the wool into Hindustan, and finally into Britain.

He was the originator and the principal of the journey and enterprise. He was a native of Lancashire, and was educated at Liverpool for the profession of a surgeon. Upon the completion of the usual course of study, however, his attention was diverted to a different pursuit, and he finally settled in London as a practitioner of veterinary surgery. After traversing the mountains, Mr. Moorcroft and his party arrived safely at Le by a route on which no European had preceded them, and on his way he first determined the direction of the upper parts and the sources of two of the three great rivers of the Panjab,—the Beyah, Vipasa or Hyphasis, and the Chandrabhaga, or Chonab, also the Acesines or Ab-i-sin. A very small portion of this tract, or the southern part of the hill states of Kahalur, Sukhet, and Kotoch, were crossed by Forster, but in a condition of personal restraint and danger, which left him little leisure for observation. About two centuries earlier (1624) the Jesuit missionary, Andrada, appears to have made his way from Srinagar to the north of the Himalaya into either Ladakh, and in the beginning of the eighteenth century, (1716,) the missionary, Desideri, entered Kashmir by the Pir Panjal pass, and thence proceeded to Lh'assa through Ladakh. The route from Kabul to Bokhara was, at the time when it was travelled by Mr. Moorcroft, new to European investigation. Goex, who travelled from Kabul to Kashgar, and thence to China, in 1803, passed over a portion of it, but it is difficult to identify all the places which he names, and his account is concise and imperfect. "Before I quit Turkistan," Moorcroft writes from Bokhara, "I mean to penetrate into that tract which contains probably the best horses in Asia, but with which all intercourse has been

MOORGAH.

suspended during the last five years. The experiment is full of hazard, but *le jeu vaut bien la chandelle*." His life fell a sacrifice to his zeal. At Andh'ko, where he spent some days in effecting purchases, he was taken ill with fever, and died.

Mazar is the place where Mr. Trebeck, the last of Moorcroft's unfortunate party, expired. A Hajeer attended him on his death-bed, and he is laid in a small burying ground westward of the town, under a mulberry tree.—*As Res*, 1816, vol. xii. 375. *Travels in the Himalayan Provinces*, Lond. 1841, 2 Vols. Edited by Dr. H. H. Wilson, *A Journey to Lake Manasarovara, in Asiatic Res.* vol. xii. *Calcutta, Moorcroft's Travels* Vol. i. pp. xix, xxv, xlv, xlvii, xlx.

MOORDA-FAROSH, PERS. Persons whose business it is to carry the dead.

MOORDAH-SHO PERS. or Gussala, HIND. persons who wash the bodies of the dead.

MOORDAH SING. Litharge: used in ointments and in oil paintings: sells at Ajmir two seers for one rupee.—*Gen. Med. Top.* p. 146.

MOOREE BENG. *Faniculum panmori*.—*D. C.*

MOOREED, a disciple, (man or woman.)

MOORE, Dr. Thomas Horsfield and Mr. Frederic Moore's Catalogue of Birds in the India House Museum appeared in 1854, 1856 and 1858. Dr. Horsfield was one of the earliest naturalists labouring in India though the extent of his labours, in Java and Sumatra, is unfortunately but little known. His researches in Java and the neighbouring islands began in 1802, and were continued till 1819. During that time he collected upwards of two thousand species, the most curious and interesting of which have been published by Messrs. Brown and Bennett, in the 'Plantæ Javanicæ rariorēs' one of the most profound and accurate botanical works of the day, and one most important for the Indian botanist to study with attention. In 1851, Dr. Thomas Horsfield published a catalogue of the mammalia in the India House Museum. In 1851, 1858, 1859, Dr. Horsfield and Mr. Frederic Moore published a catalogue of the Lepidopterous insects in that institution, and, in 1859, Mr. Moore published the notices of the Bombycidæ, of the genus *Adolia* and of the silk producing genera.—*Mr. F. Moore and Dr. T. Horsfield's catalogues*, Drs. Hooker and Thomson.

MOORGA, BENG. *Celosia cristata*.

MOORGA. BENG. HIND., *Jasminum sambac*.

MOORGABI, BENG. HIND. *Sansevieria zeylanica*.

MOORGAH, HIND. A light brown colored wood close-grained and takes a good polish,

MOORMAN.

but is not a strong or serviceable wood. Occurs in the Santhal jungles from Raneebahal to Hasdiha, but rather scarce. Native articles of furniture are principally made from this wood.—*Cal. Engineer's Journ.* July 1880.

MOORGHAB, a deep stream of very pure water, with precipitous banks, fringed with tamariaks and a few reeds. On the east banks there are sloping sand hills, on the west a desert sandy plain, overrun with camel thorn, and extending to the mountain barrier of Khorassan. The valley of the Moorghab abounds in pheasants and rock pigeons. The ancient city of Merv is in a plain, watered by the Moorghab.—*Abbott's Khiva; Markham's Embassy*, pp. 113-114.

MOORGHABI—? BENG. Hind. *Sansevieria Zeylanica*.

MOORGH-KES, PERS. *Celosia cristata*.

MOORHUR MARA. *Garcinia purpurea*.

Wild Mangosteen. | Kokeem; Kokum; MAHR.

Under these names, Dr. Gibson describes a beautiful tree of Canara and Sunda, mostly below and near valleys. Valued for its fruit which is extensively exported as a native condiment. The concrete oil also is much used. Its wood is good.—*Dr. Gibson*.

MOOR-HEN, ENG. *Gallinula chloropus*.

MOORKOO, —? *Erythrina Indica*.

MOORLIUB, a river in the Gyah district of Bengal.

MOORIES are blue cloths principally manufactured in the districts of Nellore and at Coonatoor in the Chingleput collectorate of Madras. They are 2 cubits in breadth, and 28 long and sold at from 2 to 7 Rs. each, according to their sizes. They are largely exported to the Straits of Malacca.

MOORMAN a designation, in Ceylon, for a person of a race believed to be of Arab descent; the establishment of a mahomedan colony before the close of the seventh century is alluded to by Beladeri or Ahmad in a chronicle of the Arab conquests in Europe and Asia. They are shiah mahomedans. Their priests, who are elected by them from those of their people who are most deeply versed in the Koran, officiate in the mosques and deliver their discourses in Persian. In their funerals, the corpse, after being washed and anointed by the lebbe and sprinkled with powder of sandalwood, is borne in a coffin without a bottom (its place being supplied by plaited tapes), and carried on a bier decorated with flowers, which are afterwards planted on the grave. The procession is accompanied by mourners, who chant the funeral cry of the mahomedans.

The Moormen of Ceylon seem of similar origin with the Moplah of Malabar and

MOOSHA.

the Labbi of the South of the Peninsula. Throughout the peninsula, the uneducated of the European community continue to designate every mahomedan as a moorman. — *Journal Asiatique, Fevr. et Mars, 1845.* — *Fragmens Arabes et Persans relatifs à l'Inde, Fragm. V., p. 156, in Tennent's Christianity in Ceylon p. 35. 36.*

MOORMOORA, HIND. rice pressed flat and eaten raw.

MOORMOOREE, Beng. Abildgaardia Rottbolliana.

MOOROOKOO, TAM. Nar. Erythrina indica. has a fibre of moderate strength.

MOORSHEDABAD, originally called Maksoodabad, is said by Tieffenthaler to have been founded by Akbar. Moormhedabad proper, in its largest extent, was 5 miles long and 2½ miles broad. This was in 1759 only two years after the battle of Plassey when it had already attained its greatest magnitude. *Tr. of Hind Vol. i. p. 71.*

MOORSHID, ARAB. Amongst the sunni mahomedans, this person is a religious instructor in a family. Amongst the shiah sect there are reckoned twelve, viz., Ali and his eleven descendants. The moorshid or pir of the sunni mahomedans initiates disciples, styled murid, into his sect, after repeating the astafghar or renunciation and the five sections of the mahomedan creed.

MOORTOOZA ALI, a name of Ali.

MOORUBBA, ARAB. a kind of magic square.

MOORUGAL, TAM. Bamboo.

MOORUKEA, one of the many kinds of slaves in Assam distinguished by distinct appellations. The Moorukeya is a kind of Chapanea, neither servant, slave, nor equal, but partaking of all. The master provides the Moorukeya with a pair of bullocks and a plough, and he tills his master's land for two days. On the third day the Moorukeya may plough his own ground with his master's bullocks and plough. The valley of Assam possesses gold, tea, caoutchouc, lac and ivory. — *Buller's Travels, Assam, p. 228-29.*

MOORUNGA MARAM, TAM. Moringa tree, Hyperanthera moringa: Mooraunga vayr, its root; Mooraungy-poo, its flower; Mooraungy keeray, its leaves used as greens; Mooraungy kai, its pods.

MOORUNGI-ROOT. ANGLO-TAM. Hedy-sarum sennoides?

MOORVA, TAM. Sansevieria zeylanica. Bow-string-hemp.

MOOSA. See Kol.

MOOSA SOHAG, the founder of a sect, of devotees.

MOOSAFIR SHAH, a Mohurram fuger.

MOOSHA, BENG. Andropogon serratus.

MOOSTAKA MOTHO.

MOOSHALY, See Polyandry.

MOOSHAHIDA, the contemplation or vision of future, absent, or invisible things. **MOOSHKKA**, also Castoori. SANS. Musk. **MOOSHKDANA**. PERS. HIND. Hibiscus abelmoschus.

MOOSHUL, BENG. Curculigo orchioides.

MOOSING. DUA. Moringa pterygosperma.

MOOSLI. Moosli siah, the black moosli, and moosli safed or the white moosli, are medicinal products much in use by the people of India. Safed Moosli is said to be the rootlets of Salmalia Malabarica but supposed by Ainslie to be from Curculigo orchioides, Birdwood thinks the white moosli is from Murdannia scapiflora (Boyle) or a species of Tradescantia. Moosli siah is supposed to be the product of Curculigo brevifolia, and of C. nigra?

Black Moosli.

Tal moosli, BENG. Warahi moosalie, SANS.
Kaleo Moosli, HIND. Nelepanny kalugu, TAM.
Soeah Mooslie, PERS. Nalla taty gudda, TAT.

A tuberous and wrinkled root about four inches long, slightly bitter and mucilaginous to the taste, and reckoned among those medicines which purify the blood; it also possesses tonic properties, is considered stimulant and used as an aphrodisiac. It is procurable in most bazaars throughout India. — *Faulkner.*

White Moosli.

Suffed Moosli, HIND. Tannir-vittang kalugu, TAM.
Taulia ghodalu, TAT.

The root is long, fleshy, and whitish. In Southern, and some parts of Western, India, the powdered root is used in the form of a thick mucilage with water, and answers admirably as a nutritious demulcent for convalescent persons. It is also supposed, when taken in this form, to have the effect of filling the small pox, and preventing the confluent disease. Asparagus sarmentosus root is also offered for sale as the white Moosli. — *Faulkner. Boyle. O'Shaughnessy. Gen. Med. Top. p. 145. Bengal Dispensatory. Beng. Pharm. Birdwood, p. p. 92.*

MOOSLIM. AR. HIND. Convert to mahomedanism; the plural of this is Mussulmin.

MOOSME. JAP. a daughter, a maid, not to be confounded with the Gayasha or singing girl, or the kankro, the unfortunate temporary inhabitants of the Government "Hara." — *Hodgson's Nagasaki, p. 243.*

MOOSNEE. BENG. Linum usitatissimum.

MOOSHATA — ? A female jester.

MOOSSALI. SANS. Curculigo orchioides.

MOOSTA. SANS. Cyperus juucifolius.

MOOSTAKA MOTHO. DUK. Cyperus hexastachyus. — *Roll.*

MOOTKOOLAY.

MOOSTUNG, a principal and most extensive valley of Beluchistan, situated to the south of the valleys of Quetta and Kanhee. It extends from about 29° 30' to near 30° N. lat., and its eastern boundary is nearly defined by the 67° of E. long. It is therefore about 40 miles in length, and varies in breadth from 5 to 8 miles, spreading out towards its upper end, and being gradually constricted towards its lower or southern extremity. It is bounded by parallel ranges running N. N. E. by S. S. W. of medium height, probably from 500 to 800 feet. The range to the eastward is pierced by a pass leading to the Dasht-i-be-Daulat. See Kelat.

MOOSTUSSA, **Moosubba**, **Moosuddus**. **AB. HIND.** Varieties of magic squares.

MOOSUL, is situated on the right bank of the river Tigris; its population and trade have greatly diminished since the time, prior to the discovery of the Cape passage, when it was the thoroughfare for the caravans, between Europe and India. It formerly enjoyed a high reputation for the manufacture which derives its name from the town and is known in France as mousseline and in English as muslin. At a short distance is the mound and village of Nabbi Yunus, in which is a mosque, which covers the supposed tomb of the prophet Jonah.

MOOSUL—? a long wooden pestle.

MOOSULLA, or Jac Namaz.

MOOSUM, a river near Malligafm.

MOOSUMONUM, a variety of magic square.

MOOT. BENG. *Phaseolus aconitifolius*.

MOOTA. See Sutti.

MOOTABELA. BENG. HIND. *Jasminum sambac*.

MOOTA-MOOLEE, a river formed of the Mootah and Moolce with its sangam or junction near Poonah.

MOOTAWALLI. AR. HIND. PERS. superintendent or treasurer of a mosque.

MOOTCHIE MARAM. *Erythrina Indica*.

MOOTEE MUSJEED, a mosque of Agra built entirely of pure white marble. *Tr. Hind.* Vol. i. p. 404.

MOOTE KEERAY, TAM. Greens grown in the Southern parts of the Peninsula, and eaten by the poor.—*Ainslie*, p. 255.

MOOTHA. BENG. HIND. *Cyperus rotundus*.

MOOTHEE? DUK. HIND. GUZ. SANS. *Trigonella foenum-græcum*.

MOOTH, BENG. *Phaseolus aconitifolius*.

MOOTHA, BENG. *Cyperus communis*.

MOOTHO, BENG. HIND. *Cyperus hexastachyus*, *Roell.* also *Cyperus rotundus*.

MOOTI. TAM. an egg.

MOOTKOOLAY, HIND. balls of paste boiled; dumplings.

MOPLA.

MOOTO-POLAGUM—? *Pavonia odorata*.

MOOTRULLA, SANS. *Cucumis sativus*.

MOOTSOMAH—? A very plentiful tree of Akyab. It furnishes a very small wood, used for firewood.—*Cal Cat. Ez.* 1862.

MOOTTATI TEL. a tribe of agriculturists from Telingana settled at Bellary, in the borders of the Canarese and Teling districts. The agricultural races there, are, the sudra village authorities, viz. Packinattee, Mootattee, Vellanattee, these are styled Reddy in Tamil and Telugu, or by the Mahratta term of Potail. They collect the Government rents. They claim to be the true owners of portions of the land in Southern India. Other husbandmen of the sudra caste, are the Peracooty Capooloo Goongeddy Lanceka wanloo, and Cudeywaklee wanloo. The women of the last named caste dress their hair in a bunch on the right side of their heads.

MOOTTEE, TAM. *Strychnos nux vomica*.

MOOTTHEE BANDHNA, HIND. crawling on all fours.

MOOZDULUFFA, an oratory between Arafat and Mina near Mecca.

MOPEA, in Cherra punji: near it run the rivers Bor Neigara, Bor Sorri and Hoorhoori.

MOP-GHA, a tribe who occupy the range of hills between Thouk-ye-khat and Kannie Creeks, skirting the Bghai race on the west. See Karen.

MOPLA, an energetic, vigorous, progressive and prosperous community and in considerable number; in a large portion of Malabar, they form half the populations, and in the Malabar district their total number by census is not short of half a million; they are very numerous in Travancore and are numerous in Canara. The Mopla have a large share of Arab blood, are supposed to be from intercourse between Arabs and the Tier women, and are a fine, stout, manly, good looking, race, sturdy, independent, intelligent and educated. They are industrious, and money makers, in some respects are perhaps, in their industrious habits, the best population to be found anywhere in India. They have comfortable, neat, two-storied houses and homesteads, they have most of the trade of the western coast in their hands, and are rapidly acquiring a larger and larger share in the land. They do not often seek public service. The term Moplah, is supposed to be derived from the Malaya words, Mapillah, literally, mother's son. The mahomedan moplah are sometimes called Jonakan mapillah (from Yavana, Greek) to distinguish them from the Nazrani (Nazarene) mapillah, the Nestorian Christians of

MOPLA.

Malabar. The mahomedans on the S. E. parts of the peninsula usually receive and accept the honorary designation of Labbi, from their habit of using in conversation the Arabic word "labek," may it please you, I beg your pardon, when not apprehending a remark. The Mopla in the South-western coast of India, and Ceylon, and the Labbi from the S. Eastern coast of the peninsula of India are said to have had a similar origin, viz., from Arab fathers and Indian mothers. On several occasions since that part of India came into the possession of Great Britain the Mopla have required to be coerced, and are known to possess much fanatical zeal; but it is generally supposed that agrarian disputes have been a prominent cause of their outbreaks. The Mopla of North Malabar, although mahomedans, follow the rule, as to property, of *descensus a Matrice*, the Marumaka tayam, having, in this respect conformed to hindu usage, in the times of the ascendancy of the hindus. The Mopla also take the wife of a deceased brother.

The Cholia Moplah or Labbi of the S. E. of the Peninsula are called by the Tiling, Jonangi, Zonangi, Jonagar, Jonakari. The intercourse with the mahomedan merchants and seamen and the women of western India seems to have been from the most ancient times. Abuzaid writing A. D. 916 mentions that the more devout merchants of Siraf, where young men were on board, avoided sending their ships to Ceylon, as the women were very licentious; and merchants would, when newly arrived, make advances to the daughter of a king and she, with the knowledge of her father, would go to meet him in some woody place. Besides the Mopla, there are, in the Peninsula of India, following mahomedanism, distinct races. The most numerous are the offspring of the Arab conquerors, who have come through Persia and Hindustan; the Moghul race, designated "beg," and the Pat'han or Afghan race, styled "khan", comparatively few in the peninsula of India, are all descendants of soldiers of the mahomedan armies; and these three races are still chiefly soldiers. The Moplah and the Labbi mahomedans are in considerable numbers on the extreme S. W. and S. E. of the peninsula, and are all engaged in traffic as merchants, as shopkeepers, or as pedlars. The Nao-aiti mahomedans are engaged in civil avocations, and also the Bohrah merchants and shopkeepers. The Nao-aiti differ by very marked characters from all around them. The Labbi are a tall and large made race, of a deep black colour. Their usual dress consists of a dhoti

MOPLA.

or lungu wrapper round the loins. They are largely engaged in mercantile business and as pedlars. They use the Tamil alphabet, have a Tamil Koran, and speak and read the Tamil language only. Their name is derived from the Arabic word "labek," may it please you, and the people are usually supposed to be descendants of trading or sailor Arab fathers with mothers of India.

The Bohra are found in the Rajpoot states, on the N. western coast of Peninsular India and are gradually extending to the south: they represent themselves as to their religious sect, to be the descendants of the followers of the Sheikh-ul-Jabl, the celebrated old man of the mountain. They call themselves Ismaili, acknowledge an Arohamandrite or religious chief: they principally follow mercantile pursuits, and are a robust, active, intelligent mercantile race, they are scattered all over the country, but are found principally in Guzerat, and the adjoining province of Cutch, Sind and other parts of the Bombay presidency. They are a peaceable, inoffensive body of men.

The Nao-aiti are a small non-military race who, but for a slightly zanthous tinge, would have an almost English fairness. They are called Nao-ait, new comers, and are said to have emigrated from Arabia about three hundred years ago, and are now to be found in considerable numbers in Southern India. They are slender, fair, men with very fair handsome women, and are engaged in civil avocations, never becoming soldiers. They say that they came from Arabia to the Konkan. The Nao-Aiti are supposed by some to have been sea-shore Arabs; they seem to the editor to be Persians. Indian mahomedans assert that they are the descendants of women and children from Arabia whose men were killed on being detected in an attempt to rob the tomb of Mahomed and their wives and children were sent off in a ship which landed on the western coast, but this is doubtless a story got up to vilify a race.

The Moplah are generally men of good stature, and considerable strength, and when young are not wanting in good looks. They wear a beard and moustache, cut tolerably close, and little or no hair on the head. A linen skull cap, covered by a varied colored topi, protects the crown; and with the richer members of the sect, a white and gold pugree is wound around the head also. A loose flowing chemise, with gold or colored threads worked round the borders, and a jacket of pink, blue, or elaborately embroidered cloth of gold with an under garment of scarlet or blue cloth, loose and short white cotton trousers, and wood-

MOPLA.

en sandals, more or less handsomely decorated complete the Moplah's costume. He invariably carries a china folding umbrella, and wears a bunch of keys suspended by a string from his neck. In his hand, slung over his shoulder, or tied round his waist, a smart Madras cotton handkerchief is always to be seen. The Moplah are generally cleanly and well attired when they appear out of their houses and bazaars. Their women dress in blue and white cotton cloths, and on feast days are sometimes gorgeous to behold, with rings of brass, silver and copper, bracelets of blue, red, and black glass, tinselled wood and white metal; earrings of lead, silver, and pinchbeck and necklaces of a variety of materials. The poor Moplah women are generally very dirty in their habits, their dress foul and black, their heads un-combed and their miserable dwellings odoriferous and otherwise disgusting. They seem wretched, miserable, and hopeless indeed. But with the increased demand for labour, poverty and indigence is happily retiring, and in a few years the present tenants of mud hovels.

The Tiar are mostly clean respectful and unsusceptible of kindness, and good words. Both men and women are generally handsome, with strong muscular frames, and plenty of walking and talking, and eating powers. They do not encumber themselves with large wardrobes, a white cotton cloth wound round the waist, and reaching to the knees, being only necessary for their full dress costume. The women sometimes carry a small piece of muslin over the shoulder, and draw it across the breast when a European approaches, but as white faces are not rare now-a-days, this habit is wearing out, and semi-nudity is the rule. A woman of easy virtue wears more decent apparel as a token of the laxity of her morals.

The extension of the mahomedan doctrines on the west coast took place in early times. According to Malabar records in the Arabic language some emissaries came here so far back as the reign of Cheramperumal, when mahomed was in his 57th year; and so entirely persuaded the emperor of the mission of their prophet, that he resolved to go in person to visit him. Cheramperumal died, however, on his journey, but not till he had taken care by letters which he addressed before his death to the rajahs of Malabar, that all freedom should be allowed the mahomedan teachers to propagate their religion, make disciples and build temples through the whole country. This they did with equal zeal and success; so that within

MORALI CHETTU.

a few years their creed had struck deep root here. A Dutch writer, in the year 1721, remarks that the mahomedans, being like the St. Thomas' Christians, born in the land, might be, in one sense regarded as natives of Malabar, but as they have mingled with other members of their faith, Mogal, Turk and Arab, who resort to the country for purposes of trade, they form in some sort, a distinct people. See India; Mapillary. Polyandry.

MOPLANG, or Moflong, L. 25° 28'; L. 91° 43' in the Khassia hills, about 15 miles N. of the sanitarium of Cherra. Punji. Its Dak bangalo, is 6,078 or 6,062 feet above the sea.—*Hooker Herm. Schl.*

MOQBARRA. Ar. a tomb; a mausoleum.

MOQEISH, Gold or silver thread.

MOR. HIND. A coronet: on two occasions, the Rajpoot chieftain wears the mor or coronet; on his marriage, and when going to die in battle, symbolic of his nuptials with the Apsara, or 'fair of heaven.'—*Wils. Gloss. Tod's Rajasthan*, Vol. ii. p. 252.

MORA, HIND. Grass of *Saccharum semidecumbens*.

MORA or Mount Moar, in lat. 1° 59' N, visible from Malacca, is an isolated hill near the sea, and covered with wood.

MORA. TEL. Calendering.

MORA. HIND. A footstool.

MORADABAD, near the 29th degree of N. L. Gold is obtained in the sands of the river Beyas: in those of the Gumti river: at Jompole and in sand in the Moradabad district. Moradabad was founded by Rustum Khan, who governed Sumbul under Shah Jahan. He named it Rustumnuggur, but this offending the emperor he altered it to Moradabad after prince Morad, to whom, however, he was opposed in the famous action on the Chambul in A. D. 1658, in which he lost his life.—*Elliot*.

MORÆA, a genus of unimportant plants of the natural order Ieracæ, comprising,

bituminosa, Ker.	papilionacea, Ker.
ciliata, "	ramosa, "
edulia, "	tristis, "
gawleri, Ser.	viscaria, "
longiflora, Ker.	

MORÆA CHINENSIS, THUNB. Syn. of *Pardanthus chinensis*, Ker.

MORÆDA, TAM. *Olibanum*, also *Boswellia glabra*; and *Buchanania latifolia*?

MORAINE. See *Indus*.

MORALI CHETTU or Budumura. TEL. *Sponia orientalis*, Voigt. *Celtis orientalis* R. ii. 65, also *Buchanania latifolia*.

The Sanscrit synonym is *Priyaluh*, a tree commonly called *Piyal* or *Buchanania latifolia*; but also applied to other trees. See also *Gaddancili*.

MORDECAI.

MORA MOUNTAIN, see Khyber.

MORAN, See Singpho.

MORANDA, HIND. of Kamaon &c. *Picea webbiana*, also *P. pindrow*, the silver fir.

MORANG, a large building, in which the unmarried hillmen of Assam reside.

MORAM, HIND. *Vitex negundo*.

MORAWA See India.

MORCHAR, HIN. Umbelliferous plants.

MORCHELLA, the Morel.

Sama-rogh,	HIND.	Kanha-bichu,	HIND.
Kana-kach,	"	Girchhatra	"
Kan-jach,	"	Khumb	"

The morel plants of the N. W. Himalaya are the *Morchella esculenta*, Linn. and the *Morchella semilibera*. The morels are abundant in and near Kashmir, from which considerable quantities are, after drying, exported to the plains. Dr. Stewart noticed the Morel growing fresh, at 6,000 feet, near Chumba. It is much eaten by natives, both fresh and dry, and is said to be preferred by them to the mushroom. Dried it is a not unsatisfactory addition to a stew even for a European taste: a morel is found abundantly in the desert about Jhang, &c. and is said to be got near Hoshirpur, &c. but it is not known that it is the same species. It is considered a great dainty by natives and relished by Europeans.—*Dr. Stewart, Punjab Plants*, p. 268. *Mr. Powell Hand Book*. Vol. 1, p. 384. See *Fungus*. Morel.

MORDANT. See Calico-Printing. Dyes.

MORDECAI. Hamadan, a town in Persia, is the ancient Ecbatana. It is impossible to conceive a more charming situation, a country better suited to live happily in, than Hamadan and its neighbourhood. The country is undulating, the soil rich, the water good, the climate singularly clear, healthy, and bracing; with picturesque mountains at hand for retirement during the heats of summer. In the centre of Hamadan, is the tomb of Ali Ben Sina, and not far from it are those of Esther and Mordecai, which are held in great veneration by the Jews of the town, and kept in a perfect state of repair. On the dome over these tombs is an inscription to the effect that Elias and Samuel, sons of Kachan, finished building this temple over the tombs of Mordecai and Esther on the 15th of the month Adhar 4474. The tombs are made of hard black wood which has suffered little from the effects of time during the 1½ centuries they have existed. They are covered with Hebrew inscriptions

MOREÆ.

still very legible, of which Sir John Malcolm has given the following translation. "At that time there was in the palace of Suza a certain Jew, of the name of Mordecai; he was the son of Jair of Shimei, who was the son of Kish, a Benjamite, for Mordecai the Jew was the second of that name under the king Ahasuerus, a man much distinguished among the Jews, and enjoying great consideration among his own people anxious for their welfare, and seeking to promote the peace of all Asia." The traveller, unless told, would never recognise them as tombs. The entry is by a low door, and the tombs occupy the whole of the internal space to the ceiling, leaving only a very narrow passage for walking round the huge stone-like construction in the middle. Literally, not an inch is left on the whitewashed wall on which the Jewish pilgrims of a thousand years have not inscribed their names.—*Malcolm's Persia*, Ed. Ferrier Journ. p. 35. 37. *J. B. Fraser*, p. 221. *Porter's Travels*, Vol. II. p. 91. See Khuzistan; Arabistan; Kizzel Ozan; Rawlinson.

MORDVA, commonly called Morduin; a race in considerable numbers in the province of Kazan. They are still pagan, supposed to be of Finnish origin, as likewise their language, with which the Tartar tongue is however much mixed up. In bodily form and personal appearance and mode of living the Mordva bear a greater resemblance to the Russians than to other neighbours, the Tchouvash and Tchoremisse. Their faces are generally long and thin, their hair is of a reddish colour, and their beards short and scanty. They are honest and industrious, but, like the Tchouvash, slow and dilatory in their movements have an extreme repugnance to any intercourse with other races, and, to avoid their contact as much as possible, they build their villages in the midst of a forest or wood. The Mordva are allowed by their pagan laws to have several wives, but are generally content with one. The Tchouvash, and Mordva bury their dead in their best attire, place food and beer in the coffin, and leave a little of both in the grave. A portion of the Mordva the Tchouvash and Tchoremisse, bear the name of christians; but too generally they are christians in name alone. With regard to that portion who have still remained pagans, their chief god they call Pass,—or Pass,—a word which in their language signifies likewise heaven, the mother of God, and the son of God.—*Turnerelli, Kazan*, Vol. ii. p.p. 178, 179, 182, 183. *Turner*.

MOREHEAD, Dr. C., of the Bombay Medical Service, was Principal of the Grant Medical College from 1845. Wrote on the manner of breeding leeches in *Bom. Med. and Phys. Trans.* vol. i. p. 314.—On poisoning by Arsenic, *Ibid.*, vol. viii. p. 100.—On poisoning by Opium, *Ibid.*, Vol. i. p. 323.—On the Cholera Infirmary, *Ibid.* Vol. i. part 32.—*Dr. Buist's Catalogue.*

MOREHEAD, William Ambrose brother of Dr. Charles Morehead, in the Madras Civil Service. He was latterly Puisne Judge of the Court of Sndr and Fozdaree Adawlut, a Member of the Madras Council, and twice Governor of Madras. He was an experienced judicial officer, possessing in combination with a sound judgment, a thorough knowledge of the laws and customs of the country, and a peculiar aptitude in the practical application of the same.

MOREL. *Morchella esculenta*.

TI-rh,	CHIN.	Muh-rh.	CHIN.
Kana, Kachu	HIND.	Khat karwa	HIND.

This fungus is found in the Panjab at the latter end of the rains, and is generally dug out of white ants' nests, it is one of the fungi or mushrooms, some of which, belonging to genera *Agaricus*, *Morchella* and *Tuber* are edible. *T. Cebarium* is the truffle. The wholesome sorts of mushroom are readily distinguished by being of a pink or flesh colour in the gills, changing to darker color as they get older; they have also a peculiar sweet smell: and another criterion of their being edible is the outer skin peeling off easily. With some temperaments, however, mushrooms are always poisonous.—*Powell Hand Book*, vol. i. p. 138.—*Jaffrey, Hogg, Voigt.*

MORELE, HIND. A tree of Chota Nagpore, furnishing a hard, white timber.—*Cal. Cat. Ez.* 1862.

MORESBY, Captain, of the Indian Navy, Author of the Reports on the Northern Atolls of the Maldives in *Lond. Geo. Trans.* 1835, vol. v. part ii. p. 398.—Red Sea sailing directions, *Lond.* 1842. 8vo.—*Dr. Buist's Catalogue.*

MORESSES or Manevassa Island, in lat. 4° 25' S. long. 116° 0' E., lies 15 miles N. by the most northern of the Pulo Laut group. It is of a pyramidal shape and is the largest of a group of three small islands.

MORETON BAY CHESNUT, *Castanospermum australe*.

MORINDA.

MORETON ISLAND, is 19 miles in length and 4½ in greatest breadth. All its timber is small, and consists of the usual *Eucalypti*, *Banksia*, &c., with abundance of the cypress-pine (*Callitris arenaria*) a wood much prized for ornamental work. Among the other plants are three, which merit notice from their efficacy in binding down the drift sand by their long trailing stems, an office performed in Britain by the bent grass (*Arundo arenaria*), here represented by another grass *Ischæmum Rottbœlioides*: the others are a handsome pink flowered convolvulus (*Ipomœa maritima*), one stem of which measured 15 yards in length, and *Hibbertia volubilis*, a plant with large yellow blossoms. Among the marine animals of Moreton Bay are two cetaceæ of great interest. The first of these is the Australian dugong (*Halicore Australia*), which is the object of a regular fishery (on a small scale however,) on account of its valuable oil. It frequents the Brisbane river and the mud flats of the harbour, and is harpooned by the natives, who know it under the name of Yung-un. The other is an undescribed porpoise.—*Macgillivray* vol. i. pp. 47-8.

MORI, HIND. *Ervum lens*, *Linn.*

MORIABEN, PERS. [ARAB. *Moringa pterygosperma* or Horse radish tree.

MORIA GOND, the principal agriculturists in Bastar.

MORINA ELEGANS. One of the *Dipsacæ*, a native of Persia, the colors red, and white, grown from seed as most other annuals.

MORINDA. HIND. *Abies thunbergii*.

MORINDA, a genus of plants of the natural order *Cinchonaceæ*, section, *Guettardææ*, of which the following species are known to occur in the East Indies:

angustifolia, *Roeb.* Chittagong.

bracteata, *Roeb.* Ganjam, Andaman, E. Archeipelago.

citrifolia, *L.* both Peninsulas, Pegu, Moluccas, Coochin-China.

exserta, *Roeb.* Bengal.

multiflora, *Roeb.* Berar.

persicæfolia, *Buch.* Pegu.

squarrosa, *Buch.* Kmrup.

pubescens, *Sm.* British India, Mauritius.

tinctoria, *Roeb.* all British India.

tomentosa, *Heyns.* Delhi.

umbellata, *L.* Courtallum, S. Concan.

vagana, *Wall.* China.

The bark and root of *M. tinctoria*, *M. citrifolia* in India, and *M. exserta*, in Burma, and the root of *M. ternifolia* in Mysore, are employed to form a very valuable red dye, which is fixed with alum. Most of the red turbans of Madras are dyed with the root of the Noons. The Karens prepare their red dyes most usually from the roots of two or three species. The *M. citrifolia*, is cultivated by

MORINDA CITRIFOLIA.

the Burmese for a dye, but the Karens more commonly use *Morinda exsertis*, the indigenous species. The colour, though not brilliant, is far more permanent than many other colours. A species of *morinda* is often seen growing near Burman houses, which produces a fruit as large as a pullet's egg. It is a great favorite with the Burmese, and is served up in their curries. The most agreeably fragrant, flowering shrub in the Karen forests, is a species of *Morinda*. The flowers are small, in dense heads, like other members of the genus, azure, purple externally, but white within; and has only four anthers, like a species described by Jack which he found on the Malay Islands. Specimens of the bark and root of various species of *Morinda tinctoria*, *citrifolia* and *umbellata*, were exhibited at the Madras Exhibition of 1855, from different parts of Southern India and the Northern Circars. The quantity procurable is very large, and the dye appears worthy of the attention of practical dyers. *M. tinctoria* is usually grown as a prop and shade for the pepper vine and coffee tree. The coloring matter resides principally in the bark of the roots, which are long and slender, and the small pieces are the best, fetching 8s. to 10s. a maund. It is exported in large quantities from Malabar to Guzerat, and the northern parts of Hindustan, but seldom finds its way to Europe.—*Rozb. Wall. Voigt. Buch. Mason. M. E. J. R.*

MORINDA BRACTEATA, *Rozb.*

Rough, BENG. Yaiyoe? BURM.
Mhan bin. ? BURM.

A small tree, with large shining leaves, native of Ganjam, the Andamans, the Philippines, Moluccas, common throughout the province of Pegu, and cultivated about phoungyee houses. Its wood, of a bright yellow colour, is found in the Bengal bazaars under the name of rough, and is valuable as affording a bright yellow dye.—*Dr. McClelland; Mr. Robert Brown. Voigt.*

			TEL.

This small tree is common in Kotah and Boondie, grows in the Madras Presidency, is much cultivated in that of Bombay, and grows in Pegu, Oochin-China and the Mo-

MORINDA CITRIFOLIA.

lucna. It is not a common tree in the Bombay forests; but is more frequent about the villages. The wood is of a deep brownish yellow, is easily worked is used for common purposes little, if at all, inferior to *Nauolea cordifolia*; but the tree is much smaller. Mr. Rohde has seen trees of this wood nearly two feet in diameter. It makes tolerable planks, but appears never to be so used on the Bombay side, except for door-shutters and such like. A scarlet colouring matter is procured from the roots and bark and used for dyeing handkerchiefs, turbans, &c. It is employed, also, to assist more expensive dyes in giving a red colour to yarn and cloth—the red thread used in carpet making is entirely dyed with it. The process of dyeing red yarns in the Circars is well described by Heyne. In all the Asiatic islands, *M. citrifolia* and *M. tinctoria* are extensively used as a dye stuff for giving a red colour. This is usually grown as a prop and shade for the pepper vine and coffee tree. The coloring matter resides principally in the bark of the roots, which are long and slender, and the small pieces are the best, fetching 8s. to 10s. a maund. It is exported in large quantities from Malabar to Guzerat, and the northern parts of Hindostan, but seldom finds its way to Europe. The small white flowers have a very sweet scent and the tree would thrive well and be ornamental in compounds. In Coimbatore, Nouna maram, Tam., is the proper Tamil name for the *Morinda citrifolia*, but *Morinda umbellata*, a climbing plant, and hence unfit for use as a timber, has the same Tamil name.

The red dye obtained from the roots of the *Morinda citrifolia* is equal in every respect to that of the sapan wood; and is in general use with the natives for dyeing the yarn of the native cloths, both silk and cotton; and with the exception of some specimens of Java dyes obtained from the same tree, better single colours of the kind are rarely seen. It must be borne in mind in relation to such a comparison, that the use of mineral mordant in the native process is unknown, and with the exception of weak ley made from the ashes of some of the plants of the jungles, no other application is made beyond the simple solution of the extract from the wood itself. The bark and root of this *Morinda* is used in the same manner as that of the *M. umbellata*. Most of the Madras red turbans are dyed with this substance. The plants come to maturity in three years. The roots are then dug up and sorted into three kinds, according to the fineness of the fibres. The fibres are then cut and beaten

MORINDA TINCTORIA.

down well, and then ground to powder, which latter is used for the dye.—*Drs. Wight, Roxb., Voigt, Gibson & Cleghorn, McClelland Irvine, Gen. Med. Top. p. 182, Mr. Robert Brown, Mr. Rhode, Simmonds. Cat. Ez. 1862. Thunberg's Travels, Vol. ii. p. 290.*

A small tree of the Circars, of Bengal, Berar and Burmah, its yellow, hard and useful, wood, is fit for fancy work, and does not warp. In Pegu, *M. bracteata* and this are both small trees, only found about Phoung-ye houses, in a cultivated state. *Roxb. Voigt, Captain Beddome.*

MORINDA MULTIFLORA.

Aal of NAGPUR. | Achmal of BERAR.

Much cultivated about Nagpore for its dye. Cultivated through Rajpootanah, principally near Kotah, and all over Harowtco. The plant is allowed to remain three years in the ground, and then the roots are taken up and dried. The dye is a fine turkey red and is very plentiful. One maund costs sixteen rupees. Is not used medicinally. *Roxb; Rohde M. S. S. Irvine. Gen. Med. Top. p. 125.*

MORINDA TINCTORIA, Roxb.

Al,	BENG. HIND.	Maddi chettu.	TEL.
Uch,	"	Mulagu chetty,	"
Ach,	"	Luagru,	"
Uchyuta,	SANS.	Togaru,	"

A small tree, supposed to be the same as *M. citrifolia* in its wild state. Extreme height 36 feet, circumference $2\frac{1}{2}$ feet. Height from ground to the intersection of the first branch, 10 feet. Its green fruit is pickled or eaten in curries. It is in flower and fruit the greater part, if not the whole, of the year. It is pretty common in every part of India, is largely cultivated at Ganjam, Gumsur, Boondoe, Kotah, Gurgaon, Philibect and Mewar. The woods of all the species are beautiful, hard and durable, and excellent for gun stocks. That of this species, possesses all these qualities, is variegated and white, and is employed for gun stocks in preference to all other kinds. The bark of the roots is used to dye red, the color is fixed with alum, but it is neither bright nor durable. In some parts of India, it is cultivated for the sake of the roots. In the Circars the dyers use the bark of the fresh roots bruised and gently boiled in water for a short time. The cloth or yarn is prepared in a cold infusion of the powdered gall of *Terminalia chebula*, in milk and water; it is then dried and moistened with alum-water, and again dried, and receives from the

MORINDA UMBELLATA.

above decoction, a pretty bright, but fugitive red. Dr. Irvine says the root is extensively exported from Ajmeer as a red dye. The plant is not allowed to shoot up into the bush, but is dug up the third year after planting. The flowers are very fragrant.—*Dr. Roxb. Irvine Med. Top. of Ajmeer, p. 182, Voigt, Mr. Robert Brown. Mr. Rohde, M. S. S.*

MORINDA TOMENTOSA, Heyne.

M. mudia,	HAM. Manjanati,	MALAC.
-----------	-------------------	--------

A very common Travancore tree, attaining a height of 20 to 30 feet. Its timber is of a yellow colour, and is used for various economical purposes: the inner wood of the older trees furnishes a dye.—*Useful Plants.*

MORINDA UMBELLATA. Linn.

M, padavara,	Juss. M. scandens,	Roxb.
Nya,	BURM.	Kliba,
Patangi vriksha,	CAN.	Nuna maram
Chota Al,	DUK.	Mala-gudu,
Mang-kudu,	MALAY.	TEL.

A trailing creeping plant, grows in the western parts of the peninsula of India, at Courtallam in Malabar and in the S. Concan. The roots yield a yellow dye, and in Cochin-China, with the addition of sappan wood, a red dye.—*Ainslie. Roxb. Wight. Drury.*

Morinda tinctoria, *M. citrifolia*, *M. umbellata*, in India, and *M. exserta*, in Burmah, are all employed to form a very valuable red dye, which is fixed with alum; and Buchanan mentions another species, the *M. ternifolia* in Mysore, the root of which is used for a similar purpose. Most of the red turbans of Madras are dyed with the root of the Noonu tree. The Karens most usually prepare their red dyes from the roots of the morinda tree, and at least two or three species are used for this purpose. The *M. citrifolia* is cultivated by the Burmese for a dye, but the Karens more commonly use *Morinda exserta*, the indigenous species. In many parts the roots of the *Morinda umbellata* are employed instead of chay-root in dyeing cotton yarn red: the colour is neither so bright or so durable. Dr. Heyne thus describes the process. Take $3\frac{1}{2}$ lbs. of white cotton yarn and soak it in $1\frac{1}{2}$ lb. of gingilie oil, a strong dye made of the ashes of the milk hedge, and the yarn steeped in it for four nights being dried in the sun during the day, it is then washed in brackish water and dried in the sun.

Five seers (kutchu $13\frac{1}{2}$ lb. ?) of togara root finely powdered are put into a pot of water together with the yarn and kept all night over a fire of cowdung; in the morning it is taken out and dried in the sun, the same process is repeated for two successive

MORINGA PTERYGOSPERMA.

days and nights which completes the process. It is probable that a superior dye might be obtained if the same niceties were observed as in dyeing with chay-root. In Sumatra the outward parts of the root being dried, pounded, and boiled in water, afford a red dye, for fixing which, the ashes procured from the stalks of the fruit and midribs of the leaves of the coconut are employed. Sometimes the bark or wood of the sahang tree is mixed with these roots. Marsden says that another species of bangkuda, with broader leaves (*Morinda citrifolia*) does not yield any colouring matter; but is commonly planted in the Malayan Peninsula and in Pulo Penang, as a support to the pepper vine.—*Marsden's History of Sumatra*, p. 95. *Royle Arts, &c. of India*, p. 481; *M. E. J. R.*; *Tomlinson*, p. 284; *Williams's Middle Kingdom*, Vol. ii, p. 106; *Fortune's Res. among the Chinese*, pp. 146, 167; *Ure's Dic. of Arts, Rohde M.S.S.*

MORINGA, a genus of plants of the order Moringaceæ of which three E. Indian species are known, *M. aptera*, *M. concanensis*, *Nimmo* and *M. pterygosperma*, *Gartn.*

MORINGACEÆ. *Lindl.* The Horse-Radish-Tree-Tribe comprising 1 Gen. and 3 species.

MORINGA APTERA. The Yessur of the Arabs, a native of Sennaar, Cairo, and Palestine. The seed yields the oil of ben, much used by perfumers and by watch-makers, as it neither grows rancid nor freezes readily; seeds aoid, and used as a rubefacient. They are also said to be purgative and emetic in small quantities.—*O'Shaughnessy*, p. 289.

MORINGA BURMANNI. *Vahl.* Kymthan-ban. *Burm.*

MORINGA CONCANENSIS. *Nimmo*. A species in the Southern Concan.—*Riddell*.

This species of *Moringa* is useful to the countries in which it grows, the leaves, root, flowers, seed vessels or fruit, gum, wood, bark, and oil; are used by the people of India

MORLI.

and by Europeans. The tree is very abundant all over British India, Burmah and the Malay peninsula. The leaves, flowers and seed vessels are used in curries. The roots have precisely the flavour of horse-radish, and seem identical in chemical composition, and in India are substituted for the true horse-radish by Europeans. The gum and bark are used in native medicine, the oil is aperient, and much used by the natives in gout and rheumatism, the native doctors prescribe the green root as a stimulant in paralysis and in intermittents, in scruplo doses, and use it also in epilepsy and hysteria. The seeds are also used internally by the native practitioners, for their pungent and stimulating virtues. In Jamaica the wood is used for dyeing a blue colour. An oil is obtained from the seeds possessed of the same qualities as the oil of ben, the product of the *M. aptera*, a native of Sennaar, Cairo and Palestine, much used by perfumers and by watch makers, as it neither grows rancid nor freezes readily. The delicate perfume of flowers are often retained by the ben oil, by pouring it over the flowers, or strowing layers of the flowers for about four hours over cotton soaked in the oil. In the West Indies the oil is used as a salad oil. According to Mr. Faulkner, ben oil is also prepared from the *Guilandina moringa*, a tree which he says grows in Ceylon, Arabia, Egypt and Ethiopia. A compound infusion of *Sohun-juna* represents a similar infusion of horse radish of the London Pharmacopia. A compound spirit of *sohun-juna* is stimulant in a dose of from two to four fluid drachms in water. It is obtained in a large quantity, does not dissolve in water, resembles in some respects gum tragacanth, for which it may probably be substituted. It exudes freely whenever an incision is made in the bark. It is used by the natives in head-ache mixed with milk and rubbed on the temples, and is also employed as a local application for pains in the limbs.—*Drs. Royle, Ainslie, Roxb. Mason, J. J. Stewart, Voigt*, 78. *Mr. E. J. R. Riddell. O'Shaughnessy, Mr. Jaffrey, Cal. Cat. Fz.* 1862. *M. E. J. R. Beng. Phar.* pp. 304, 414.

MORINGA ZEYLANICA. *Pers.* Syn of *Moringa pterygosperma*, *Gartn.*

MORKANTEE. *BENG.* *Acalypha indica. Linn. Roxb. Wight.*

MORLI, MAHR. A girl devoted to the hindoo gods, who never marries but awaits a summons. The Morli of the Mahratta people is identical in character with the Jogini and the Basavi of the Tiling people. Basaya is a name of the vahan or conveyance of the god Siva; the *linga basavi* are

MOROCARPUS LONGIFOLIUS.

women who been' dedicated to the lingam; the garuda basavi have been dedicated to garuda, the eagle vahana of Vishnu; but they are alike common. There are few instances of the brahmin, the chetvya vaisya or sudra races devoting their children, but amongst the non-aryan races in the large towns it is common, but done as a means of prostitution without shame. The victim is taken to the idol, in some parts to a knife, to whom she is married by a ceremony and the deity is supposed to take possession of her. About Oomraoti in Berar young men are similarly devoted and styled Wagni. See Murlu.

MORMON. A religious sect in N. America practising polygamy. Towards the year A.D. 1870, their organization in the territory of Utah was sustaining shocks which must end either in its being entirely remodelled or overthrown; they are no longer persecuted as they were when they were driven from Missouri and Illinois, and compelled to seek a new home far remote from angry and cruel men. Neither did they now persecute the gentiles as they did after they had established themselves in Salt Lake City, and thought themselves powerful enough to defy the authority of the Executive Government; the Chief Justice of Utah refused to admit to the privileges of citizenship a Mormon living in a state of bigamy, and openly violating the law of the United States. The Legislature of Utah had sanctioned the alienation of the public domain as a reward for good and obedient Mormons. The legality of all these gifts of land is now denied. Law Courts are thus affecting a silent revolution by simply administering the law, though Mormonism may survive, the fate of polygamy is sealed.

MOR-MORAH, a religious sect located in Siam.—*Captain S. O. Hannay, in Bl. As. Trans.* 1838, Vol. vii. p. 671. *Dr. Buist's Catalogue.*

MOR-MUJ. PANJABI. Carrot, *Daucus carota*.—*Linn.*

MORMYRIDÆ This family comprises 19 Mormyrus, 2 Hyperopisus, 4 Mormyrops.

MORO. HIND. *Quercus dilatata.*

Debrugeasia velutina, Gaud.
Conocephalus nivosus, Wight & Ic.
Urtica verrucosa, Moon, Cat.
Urtica longifolia, Burm.
Gass-dool, Singh.

Common in the Central Province of Ceylon at an elevation of 1,000 to 3,000 feet. The Singhalese make fishing-lines of its bark.—*Thw. En. pl. Zeyl.* p. 261.

MORONTOBARA.

MOROCARPUS WALLICHIANUS.—*Thw.*

Debrugeasia Wallichiana, Wedd.
Urtica leucophylla, Wall. Cat.

A tree of 15 to 20 feet high, grown at Hautani, in the Central Province.—*Thw. En. pl. Zeyl.* p. 262.

MOROCCO, a kingdom in the north of Africa, ruled by a mahomedan sovereign; it has a population of about eight millions.

Berber ... 2,300,000	Negro and
Shellok... 1,450,000	Abid ... 120,000
Moor ... 3,550,000	Christians... 300
Arab ... 740,000	Renegades... 200
Jew ... 340,000	

The Arabs of Morocco, are the Moors of Spain, the Saracens of France, tall graceful sons of the Arabian desert, courteous, brave, hospitable and confiding,—descendants of the conquerors, who, in the first ages of the hijrah, propagated the religion of Mahomed, crossed the straits of Gibraltar, destroyed the Gothic chivalry, reigned in Spain for 700 years, invaded France, devastated Italy and pillaged the suburbs of Imperial Rome. When the last Arab king submitted to Ferdinand and Isabella and the Moorish palaces of Grenada were surrendered to the christians, the old conquerors went back to Africa and resumed their nomadic life. In Tripoli, the Arab has monopolized the country. In Tunis the native re-appears in a smaller proportion, and in Morocco he is very scarce. The Berber and Shellok are untamed warlike tribes dwelling in the mountains; when possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection, they are the same race whom the French call Kabyle and Zouave. The Moor are little idle men who grow fat from indolence they are lowlanders, traders, dwellers in cities, avaricious, perfidious, cowardly, cringing and insolent. The Riff dwellers of Kalhya, Cape Tres Forcas, correspond to the Arab Sahali on the Red Sea coast, the name Riff being evidently from ripple, "a bank." The towns of Mequenez on the N. and Morocco on the South, are the chief cities. See Subhaili. Semitic races.

MOROCCO LEATHER.

Maroquin,	Fr.	Saffian,	Rus.
Saffian,	GER	Marroqui,	SP.
Marrocchino,	It.		

A fine kind of leather prepared of skins of goats in the Levant, Barbary, Spain, &c. It is of various colours, and is used for lining carriages, chairs, in the binding of books, &c.—*McCulloch's Commercial Dictionary*, p. 809.
MORONTOBARA, or the Women's Haver, now called Muari, or Cape Monz.

MORTI

MOROBBI. AR. PER. HIND. A revered person, a master; properly murabbi.

MORR. ARAB. Balsamedendron myrrha. —Nees.

MORRE. SINGH. Eye ball tree, a tree of the central province of Ceylon. A cubic foot of its wood weighs 62 lb. and it is said to last 25 years. It is used for common house building, and next to Galmorre, Nephelium, furnishes the best firewood for lime and brick-kilns. Berries eaten when ripe. —Mr. Mendis.

MORRHUA VULGARIS. In New England, the intestines of the common cod are cut into ribbin isinglass; in Iceland also the cod is said to yield isinglass, so also the Ling (Lota molva), but Mr. Yarell informed Mr. Royle that he had no reason to believe that Isinglass is so prepared; in the southern parts of England fish being brought alive in well boats as far as possible, cod and also ling sounds are mostly preserved soft, by salting, and are dressed for table as a substitute for fish. See Air-bladder; Sounds; Isinglass, Fish; Fisheries.

MORRHUA OLEUM, LAT. Cod Liver Oil.

MORRIESON. In the years 1812-1818, that portion of the Soonderbuns lying between the Hooghly river and the Bara Punga, was surveyed by two young brothers, Lieutenants in the Honorable Company's army. Their names were Hugh Morricson of the 4th Regiment Native Infantry, who is supposed to have died of jungle fever at Jessore, contracted whilst surveying in this unhealthy tract, and W. E. Morricson of the Bengal Engineers, who was killed by a grape shot upon the 3rd of January 1815, at a place called Joetghur, in an unsuccessful attack upon the Goorkhas. —*Cal. Review*, p. 15.

MORRISON, father and son, eminent Chinese scholars. The father wrote a Chinese Dictionary, the son a Compendious Description of Chinese products.

MORSE, Mr. a governor of Madras in the time of Marquis Dupleix, 1744.

MORT, HIND. Desmodium species chiti mort is *D. argenteum*, and kali mort is *D. tiliaefolium*.

MORTA. HIND. *Pernanthes quinqueloba*.

MORTI, the Votiack race call themselves Morti, a word which in their language signifies "men." The portions of Kazan which they inhabit they call Kam Kozeen, or "the land lying between two rivers," namely, the Kama and Viatka. A great portion of their race still cling to paganism. In their physical form, the men are generally middle sized and thin resembling more

MORUS.

the Finns, from whom they descend, than any of their neighbours. The women are still shorter in stature than the men, and have exceedingly small eyes, which gives them a displeasing look, but to make amends for their want of beauty, they are modest, timid, and virtuous, and at the same time industrious and skilled in several kinds of handicraft. The funerals of the Votiack resemble much those of the Tchouanah. They wash the body, dress the deceased in his best attire, and after this, as a mark of grief, they break the points of the knives they carry at their belt. After the Russian form, a lighted wax candle is placed at the feet of the deceased. When the corpse is carried to the grave, it is placed between two planks, to which are attached a hatchet, a knife, some articles of clothing, food, and other objects, which the Votiack consider to be most needed in the other world. When the grave is filled up, they light several wax tapers, and scatter over the tomb three hard boiled eggs, cut into small pieces; while they are doing this they exclaim, "Take that! poor soul; it will be useful to thee." —*Turnerelli's Kazan*, Vol. ii. pp. 186, 191.

MORTY or Mortay Island is the most northerly of the Molucca group, and lies in lat 2° 44' N., long. 128° 25' E. It is about 57 miles long, and slopes down from the high land into a point that forms the Cape.

MORU. — ? Butter milk.

MORUS, a genus of plants belonging to the natural order Urticaceæ, of which the following E. Indian species are known :

- alba*, L. all southern Asia.
- atropurpurea*, Roxb. China, India.
- bifaria*, Wall. ?
- cashmorianna*, Royle. Kashmir.
- indica*, L. Bengal.
- laevigata*, Wall. Nepal, Saharanpore.
- multicaulis*, Perrottet, China.
- nigra*, L. Persia, Egypt.
- paniculata*, Roxb. Moluccas.
- rubra*, L. introduced into India, Bengal.
- scandens*, Wall. China.
- serrata*, Roxb. China.
- tatarica*, Pall. Cultivated in British India.
- viridis*, Buch. Patna.

MORUS.

The genus *Morus* is numerous in species and abounding in individuals, many of which are cultivated on account of their fruit, but still more for their leaves as food for the silkworm. The bark of the white mulberry seems from very early times to have been made into paper in China; Marco Polo informs us that "the Grand Khan causes the bark to be stripped from these mulberry trees, the leaves of which are used for feeding silkworms, and takes from it that thin rind which lies between the coarse bark and the wood of the tree. This being steeped, and afterwards pounded in a mortar until reduced to a pulp, is made into paper, resembling that which is made from cotton." The bush cultivation of the mulberry in Bengal, for feeding silk-worms, consists in planting cuttings, which, as they grow, are cut down about four times in the year, in order to produce young leaves for the successive brood of silk-worms. Very satisfactory half stuff is obtained from the bark of the stems. The bark separates when the cut stems are steeped in water, and when pounded up, the greater part of the mucilaginous matter passes off, leaving a mass, having much of the good qualities of linen rag half-stuff. In China, the leaf of the common mulberry is the principal object of its culture, but the fruit is eaten, and the wood burned for the lamp-black used in making ink. *Morus alba*, and *Morus nigra* grow equally well in the Deccan; the white, growing to a very large tree, shedding its leaves before the hot season. The red mulberry bears fruit in the rains, as well as the black. Silk worms may be fed on its young fresh leaves although the leaves of the white are preferred; it grows from seed or cuttings. *M. alba*, *atropurpurea*, *indica*, *nigra*, *rubra* and *tartarica* are all grown in China, but *M. alba* and *M. nigra* are the general favourites and many varieties have been obtained by cultivation,—the shan-sang or hill mulberry; the kin-sang or golden mulberry; the kisang or fowl-mulberry; and the i-sang or *Morus tatarica* are all grown. The white species produces little fruit. An epiphyte grows on the mulberry tree in China, it is called sang-shang-ki-sang, and its woody branches are highly prized as a medicine in the pregnant and puerperal states. There is considerable doubt as to the species of *Morus* cultivated in the Punjab plains, but some of *M. alba*, *Cashmeriana*, *indica*, *lævigata*, and *tatarica*, grow in the hills up to Kashmir, 5000 feet, where they abound and to 7000 feet on the Chenab. Vigne states that the mulberry grows in parts

MORUS.

of Tibet, where Thomson mentions it at over 9000 feet. From the accounts by Dr. Bellow and others, nine or ten kinds would appear to be abundant in parts of Afghanistan. Some of the trees attain to large size, specimens of 10 and 12 feet girth are not very uncommon, and Dr. Stewart noted one of 16 feet in the Salt Range. The wood of old trees is strong and useful and is much employed for construction, implements, &c., in parts where the tree is common. About Peshawar it is the staple ordinary timber. The fresh twigs are in Kashmir used for tying loads.

The Japanese make abundance of paper as well for writing and printing, as for tapestry, handkerchiefs, packing cloths for goods, &c. It is of different qualities, and some of it is as soft and flexible as our cotton cloth. Indeed, that used for handkerchiefs might be mistaken for cloth, so far as toughness and flexibility are concerned. The materials of which it is made is the bark of *Morus papyrifera*, now transferred to the genus *Broussonetia*. In December, after the tree has shed its leaves, they cut off the branches about three feet in length and tie them up in bundles. They are then boiled in a ley of ashes in a covered kettle, till the bark is so shrunk that half an inch of the wood may be seen projecting at either end of the branch. When they have become cool, the bark is stripped off and soaked in water three or four hours until it become soft when the fine black skin is scraped off with a knife. The coarse bark is then separated from the fine: the new branches make the finest paper. The bark is then boiled again in fresh ley, continually stirred with a stick, and fresh water from time to time is added. It is then put in a sieve and taken to a brook, and here the bark is incessantly stirred until it becomes a fine pulp. It is then thrown into water and separates in the form of meal. This is put into a small vessel with a decoction of rice and a species of *Hibiscus*, and stirred until it has attained a tolerable consistence. It is then poured into a large vessel, from whence it is taken out and put in the form of sheets on mats or layers of grass straw, these sheets are laid one upon another with straw between, and pressed to force the water out. After this they are spread upon boards in the sun, dried, cut, and gathered into bundles for sale. This paper will better endure folding, and last longer than that of Europe.—*American Expedition to Japan* p. 64. Dr. O'Shaughnessy, p. 577. Royle *Fib. Pl.* p. 341. William's *Middle Kingdom*, p. 28. Riddell. Smith

MORUS SERRATA.

Mater. Med., China. Dr. J. L. Stewart, *Punjab Plants* p. 218.

MORUS ALBA, Linn.

Safed-tut, Beng. Hind. | Tukhlo, KASHMIR.
Tut; shahut, " " |

Cultivated in Europe, and in all the south and east of Asia, for its leaves, which are plucked to feed the silkworm, *Roxb. Voigt.*

MORUS ATROPURPUREA, Roxb.

M. rubra, Linn. | Shatoot, DUK.

This species of mulberry from China produces a very agreeable and valuable black berry, in great quantities.—*Roxb. Muson.*

MORUS INDICA, Linn.

PO-SA, BURM. | Toota, SANS.
Toot, DUK. HIND. | Rata-ombilla, SING.
Babisaram, MALAY. | Cumble pullum, TAM.

A small tree with long tapering leaves sometimes lobed, fruit dark red, used for making tarts; is found in Southern India, is largely cultivated in Bengal to feed silkworms, has a delightful fruit considered by the natives as cooling and aperient.—*Riddell, Ainslie, p. 223, Roxb. iii. 596.*

MORUS LÆVIGATA, Wall.

Tut, HIND.

Grows in Nepal, and Saharanpur. Attains a large size; wood excellent. *Wall.*

MORUS MULTICAULIS.—Perrottet.

M. encullata, Bonifone.

Grows in China, the Philippine Archipelago and in India to which it has been introduced it will probably soon displace the white mulberry for feeding silkworms. The cultivation of M. multicaulis, and M. Sinensis has been largely extended in the Punjab. *Voigt. Dr. J. L. Stewart Punjab Plants, p. 218.*

MORUS PARVIFOLIA, Royle.

Ful, CHENAB. | Tut, PANJAB.
Kuran, PANJ. | Toothreo, Tutri, " "

This small tree is found in the Sutlej valley between Rampur and Sangnam at an elevation of 4,000 to 7,000 feet; it occurs wild in the plains of the eastern Punjab, and grows up to 5,000 feet in Kashmir, &c. Its fruit does not appear to be valued. Wood highly esteemed. It is cultivated, foliage prized for cattle.—*Dr. J. L. Stewart Punjab Plants, p. 218. Cleghorn Punjab Report Kullu and Kangra, pp. 65, 80.*

MORUS SERRATA, Roxb. Wall.

Himalaya mulberry, *Morus.*

Kran; Kram; Chun, CHINA; Kimu; Soa, SUTLEJ.
HIND. |

This tree is common in many parts of the Punjab Himalaya from 2500 to 9000 feet. It grows to a large size, trees of 10 and 12 feet girth being not uncommon. Dr. Stewart had seen several over 20 feet, and at Bar-

MOSCHDÆ.

moor, in Chumba, he saw a magnificent specimen of 28 feet girth. Its fruit is not much valued. Its wood is yellow and strong, but is subject to the attacks of worms. It is used in construction and for ploughs, troughs, toys, &c. The twigs are in some parts largely lopped for fodder. *Dr. J. L. Stewart Punjab Plants, p. 219.*

MOSALLYON. See Berberoli.

MOSANEA, a plant of Ganjam and Gumsur. Extreme height 15 feet. Circumference 2½ feet. Height from ground to the intersection of the first branch, 4 feet. Not very common. The bark is used medicinally for wounds and sores. The wood is useless except for firewood.

TIBET.

The Musk deer is found from Siberia, through Central Asia to the Himalaya; in these mountains it is found at great elevations, in summer rarely below 8,000 feet and as high as the limits of the forest. It is solitary, living in retired spots, near rocks, or in the depths of the forest. It is easily traced by the heaps of dung on its runs, for it is partial to localities, and both in habits and general appearance has a great affinity to the hare. Adams sometimes found it by following up its trail through the copse across the grassy glade into a little dell, where the indifferent creature might have been seen feeding within a few yards. The mode of its progression is remarkable and comprises a series of spasmodic leaps while now and then it stops to reconnoitre, or walking a few feet, resumes these fantastic movements. The musk is most sought after during the rutting season in autumn. Adams repeatedly examined the contents of bags at other seasons, but except a rank offensive odour from the dark pigmented substance contained in them, he could not discover a trace of musk. It is said that unless the musk-bag be removed before the body cools the scent evaporates. The market-value of each bag is from £1 to £1 10s. *Adams Naturalist in India. Jerdons Mammals.*

MOSCHUS NAPU, *F. Cuv.* syn. of *Tragulus javanicus*, *Pallas*.

MOSCHUS PALANDOK, *Marsden*, syn. of *Tragulus kanchil*, *Gray*.

MOSLIM.

a chain of islands parallel to the Martaban coast, from lat. 14° 27' N. to lat. 13° 47' N. distant from it 3 to 5 leagues. The islands are steep, having 20 or 22 fathoms close on to the western sides.

MOSCOVIA, *Se. Russia* leather.

MOSCOW, one of the chief towns of Russia in Europe.

MOSELINA, *Se. Muslin*.

MOSES, a leader of the Hebrew race, known amongst mahomedans who recognise him as a prophet as Musa, or Hazrat Musa, also as the Kalam-ullah or mouth piece of God and as the author of the five books which they style Taurat. His Egyptian name means Son of the Water, he had been brought up in the neighbourhood of Heliopolis, the chief seat of Egyptian philosophy. On leaving the city of the Sun, called in Coptic Rameses, in Greek Heliopolis, he marched the first day sixteen miles along the right bank of the Pelusiac branch of the river. He rested the first night at a village called the Tents, in Hebrew Succoth, in Greek Scema. Moses, led the Israelites out of Egypt B. C. 1320.—*Sharpe's History of Egypt, Vol. i. p. 50.*

MOSES OF CHORENE, wrote a little after A. D. 440, and probably drew from earlier authors. He speaks of Jenaadan (i. e. Chinistan or China land) as a great plain country east of Scythia, at the extremity of the known world, and occupied by a wealthy and civilized people of character so eminently pacific as to deserve to be called not merely friends of peace but friends of life. Their country then furnished an abundance of silk, inasmuch that silk dresses, so rare and costly in Armenia, were there common to all classes.—*Yule Cathay I. p. 83.*

MOSHANI. See Kurumbara.

MOSLIM. ARABO-EUROPEAN, a term by which mahomedans in Asia designate themselves; it is derived from the Arabic word salam, he gave safety, peace, and hence moslim, a person who is saved, the plural of which is musulmin ordinarily written Musulman and for the femine Mussulmani.

The first intimation of the Mahomedans attempting the invasion of India is during the kalifat of the Kalif Omar, who built the port of Bassorah at the mouth of the Tigris, chiefly to secure the trade of Guzerat and Sind: into which latter country a powerful army penetrated under Abul Aas, who was killed in battle at Aror. The kaliph Oosman, who succeeded Omar, sent to explore the state of India, while he prepared an army to invade it in person, a design which he never fulfilled. The generals of the kaliph Ali made conquests in Sind which they

MOSQUE

abandoned at the death of Ali. While Yezid was governor of Khorasan several attempts were made on India, as also during the kaliphate of Abdool Malik, but without any lasting results. It was not till the reign of Walid that any successful invasion took place. He not only finally conquered Sind and the adjoining continent of India, but rendered tributary all that part of India on the W. side the Ganges. The energy and rapidity of such conquests are manifested by observing the arms of Islam at once on the Ganges and the Ebro, and two regal dynasties simultaneously cut off, that of Roderic, the last of the Goths of Andalus, and Dahir Des-pati in the valley of the Indus. It was in A. H. 99 (A. D. 718; S. 777) that Mahomed bin Kasim vanquished and slew Dahir prince of Sind after numerous conflicts. Amongst the spoils of victory sent to the kaliph on this occasion were the daughters of the subjugated monarch, who were sent to the kalif but were the cause of Kasim's destruction, when he was on the eve of carrying the war against rajah Harobund of Kanouj. They asserted that Kasim had seen them before their setting out; on which the kalif ordered Kasim to be sewed up in a raw hide and so forwarded and the girls, seeing their country's victor in that condition, acknowledged that they had unintentionally deceived the kalif. Some authorities state that Kasim actually prosecuted the war and as Sind remained a dependency of the caliphate during several successive reigns, the successor of Kasim may have carried out his plans. Little is said of India from this period to the reign of Al-Mansur, except in regard to the rebellion of Yezid in Khorasan, and the flight of his son to Sind. The eight sovereigns, who rapidly followed, were too much engaged with the Christians of the west and the Huns on the Caspian to think of India. Their armies were then in the heart of France, which was only saved from the Koran by their overthrow at Tours by Charles Martel.—*Toul's Rajasthan* Vol. i. p.p. 242 to 244 *Burton's Pilgrimage to Mecca*, Vol. i. p. 133.

MOSQUE, the place of public worship amongst mahomedans. The word is doubtless derived from the Arabic Masjid or Masjid. It is generally a square with three walls so built that looking to the back wall the worshipper faces Meccah. The Kazi or preacher stands on a Mimbar, a small dais with three steps built against the back wall. The first mosque of the mahomedans was erected by Mohammed Kuba at El Medinah: shortly afterwards, when he entered Meccah as a conqueror, he destroyed the idols of the Arab

pantheon, and purified that venerable building of its abominations. He had probably observed in Syria the two forms appropriated by the christians to their places of worship, the cross and the Basilica; he therefore preferred a square to a parallelogram, some authors say with, others, without a cloister, for the prayers of the "saying faith." At length in the reign of El Walid (about A. H. 90) the cupola, the niche, and the minaret made their appearance, and what is called the Saracenic style became the order of the mahomedan world.

MOSQUITO. **MACH'R.** **HIND.** A term applied to certain stinging flies belonging, in all probability, to several distinct genera. The mosquitoes are either gnats or gnat-like insects, which are furnished with a proboscis adapted for piercing the flesh, and at the same time forming a kind of siphon through which the blood flows; this instrument moreover injects into the wound which it makes a poison which causes inflammation. Many insects called mosquitoes probably belong to the same tribe as the common gnat (*Culex*, *Lin.*); Humboldt however asserts that the insects known by that name in America belong to the genus Simulium, and that the *Culex*, which are equally numerous and annoying, are called Zanoudoes, which means long legs. The former are what the French call moustiques, and the latter cousins. Of all insect pests the most provoking by far is the mosquito, *Culex fatigans* *Wal.* next to the torture which it inflicts, its most annoying peculiarities are the booming hum of its approach, its cunning, its audacity, and the perseverance with which it renews its attacks however frequently repulsed. In Kandy Mr. Thwaites finds *C. fuscans*, *C. circumvolens*, &c., and one with a most formidable hooked proboscis, to which he has assigned the appropriate name, *C. regina*.

It is not however only in tropical countries, that these insects swarm. The mosquitoes and other insects that fill the air during the summer months in high latitudes, are, in fact, the scourge of man as well as of beast. No one, indeed, who has not traversed the swamps and forests of Lapland or America, can form the most distant conception either of their numbers or the annoyance to which they subject the way-farer. A traveller relates that when in Lapland, he suffered exceedingly from the bite of the mosquitoes. Until in a state of fever, and that his face was marked as if recently recovered from the small pox, he set those troublesome insects at

MOSQUITO.

defiance; but after a time, following the example of others, he was accustomed to wear a veil—an evil of itself of no inconsiderable magnitude under a burning sun, and when perhaps the thermometer ranges at from 80° to 90° in the shade. Even the hardy Lapps and squatters are obliged to guard the exposed parts of their persons in one way or another. Some smear their faces with tar or the like; whilst others again wear a cowl, like a monk, which, leaving little more than the eyes, nose, and mouth uncovered, falls down over the shoulders, and thus completely protects the more vulnerable parts, such as the forehead, the ears, and the neck, from the attack of the voracious insects. When on a journey, moreover, these men are never without a sort of linen sheet, which they throw over their persons when resting, or at the bivouac. This sheet is a very useful part of one's travelling equipments. When his comrades have been reposing beneath its friendly shelter, he had seen it so completely covered with mosquitos, that the sheet itself was hardly perceptible, all that met the eye, in short, was a living dark mass. Even within doors, the Lapland traveller is sadly pestered by these insects; for though peat, placed in an open iron pan, is kept constantly burning at the outer doorway, and the apartment not unfrequently filled with smoke arising from green boughs, which for that purpose are cast on the fire, yet those troublesome guests find their way into the room in numbers, so that what with their stings and constant buzzing, a man, unless nature be quite exhausted, has little chance of obtaining any repose. The bite of the mosquito gives rise at times to somewhat ludicrous scenes. On one occasion, for instance, when descending a feeder of the great river Muonio, in Tornia Lapmark, where he had been fishing, the man who was rowing was so pestered by these insects, as to be almost beside himself. For a while he resorted to various expedients to rid himself of the enemy, but his patience becoming at length fairly exhausted, he suddenly dropped the oars, and throwing himself over the side of the boat, clothed as he was, plunged head-long into the water. This device, which afforded much amusement, if it did not altogether relieve the poor fellow from his tormentors, tended at least to cool his blood, and to give him a temporary respite from pain.

But though the Scandinavian mosquito is a sore pest to man as well as beast, it would seem from the accounts of travellers, that his compeer in the American wilds is a still greater scourge. Captain Franklin,

MOSQUITO.

when speaking of this insect, very eloquently says,—“The food of the mosquito is blood, which it can extract by penetrating the hide of a buffalo (American Bison); and if it be not disturbed it gorges itself so as to swell its body into a transparent globe. The wound does not swell like that of the African mosquito, but it is infinitely more painful, and when multiplied a hundred fold and continued for so many successive days, it becomes an evil of such magnitude, that cold, famine, and every other concomitant of an inhospitable climate must yield the pre-eminence to it. It chases the buffalo to the plain, irritating him to madness, and the Rein-Deer to the sea-shore, from which they do not return until the scourge has ceased. Mr. T. W. Atkinson, in his recent narrative of *Adventures in Oriental and Western Siberia, Mongolia, &c.*, had also reason to complain bitterly of the scourge of mosquitos over much of the country which he traversed. The mosquito has three stages of existence, in two of which it is a water insect, in the third the well known winged one. On the 6th May, at 6 A.M. Dr. Gilchrist observed several mosquitos on the surface of some stagnant water, each in close proximity to a yellowish substance, which, when viewed through a microscope, proved to be a collection of eggs that the mosquitos were depositing; each collection, though consisting of not fewer than one hundred eggs, did not exceed three-twentieths of an inch in length and about one-twentieth of an inch in breadth. These eggs were arranged in lines, standing on end, and were each about 1-40th of an inch long; the lower end being larger than the upper, so that the upper surface of the collection was somewhat concave. A few of these collections of ova were carefully introduced, with some of the water on which they floated, into a tumbler, and placed under a glass shade. Excepting a change of colour, from a yellow to a dark brownish grey, which occurred within six hours after being put into the tumbler, no visible alteration took place, till two days and a half, when the water was found to swarm with animalcules. The shells of the ova were still adherent, as when first observed. On examining one minutely, the larger, or under, end was found to have opened, like a lid, to allow the insect to escape into the water. A lady's thimble, furnished with a lid, would resemble exactly the appearance of what is being described. The design of having the lids placed at the bottom, is, evidently, to allow the newly hatched animalcules immediate exit from the shell into the water;

MOSQUITO.

and the concavity of the whole collection above alluded to, effectually tends to retain the large ends undermost. Had the ova been arranged promiscuously, as to the large and small ends being upwards and downwards, it is evident that the newly hatched insects, under the former arrangement, would have some difficulty in reaching the water, a difficulty that most probably, would amount to an impossibility; one which, at all events, is effectually prevented by the concave form of the collection. In the newly hatched insect, the chest, or thorax (the heart is seen obscurely however, the body being only semi-transparent), furnished with four projections; from this organ two blood vessels proceed down the centre of the body, to the end of the elongation the extreme termination of which is to be seen just above the surface of the water, where the insect lives, for the most part; the body being suspended, as it were, from this, head lowermost. Between the heart, in the thorax, and the extremity of this singular elongation, an active sanguiferous circulation is to be observed; in all probability, therefore, it is the seat of the lungs or gills, and it would appear, that a comparatively large supply of air, is essential to the existence of the insect, as it lives as much as possible, in this pendulous position at the surface, with the extremity of the elongation rising just above. Its motion, which is quick, is effected by a rapid bending of its whole body, so that the head and tail (the latter consisting of a bundle of delicate filaments,) approximate, alternately, on either side of the body; it always goes tail foremost, so that the head is dragged along behind. When in search of food, it throws out, in advance of its mouth, a couple of delicate brushes, the individual filaments of which, are of microscopic size. Each of these is put in rapid circular motion: whereby a double kind of whirlpool is occasioned; whatever food comes within the sphere of these vortices, is speedily devoured. The food appears to be, principally, decomposing vegetable matter, some of which he put into the tumbler, as the vessel in which the ova were discovered contained it; on this they fed voraciously. They did not however entirely confine themselves to a vegetable diet. He was much amused with one, when in a drop of water under the microscope; in these confined limits its appetite did not forsake it, and the only article of food it found, was the head of one of its own species. So soon as this came within the vortex, it was ravenously seized, but, being apparently, too large a morsel, it was

MOSQUITO.

let go, after sundry futile attempts at swallowing. It frequently came within the whirlpool again, and was as often seized, but with no better success. They, however, eat the shells they had recently quitted. Some that were kept in clean water, without food, died on the third day. In this stage of their existence, the insects were lively and graw apace. At the termination of 21 days, during which the water was thrice changed, they had attained three or four twentieths of an inch in length. On attaining this size or age, they underwent a second metamorphosis. Most likely they cast their former envelope, for the hairs, so conspicuous on the former insect, were not to be seen on the present. The shape, it will be remarked, has materially altered, but the most remarkable change is that which occurs with respect to the seat of the lungs, or gills. These organs are now situate in the thorax, their former seat has disappeared, and the channel of communication, now, between them and the air, are two small tubes on the top of the chest. In this stage of their existence, the insects are much less active than during the former one. A still greater contrast, however, is that, now, they do not require food, and have no mouth; in this respect resembling the chrysalis stage of the butterfly tribe. But the demand for air appears increased; they rarely leave the surface of the water, and when they do descend, they take down a supply of air, small globules of which are distinctly to be observed, at the end of the tube. Their descent is accomplished by striking the water with their body, but, being specifically lighter than that fluid, they rise without any effort to the surface, though, in case of despatch, can impel themselves upwards by the same means as they descended. However, as has been remarked, they seldom leave the surface, and, having done so, speedily return to it. The insects remain about 48 hours in this stage; towards the termination of which the legs and proboscis of the winged mosquito can be distinctly seen through the thin membrane that surrounds it. This in due course, bursts, when the winged mosquito draws itself out, stands on the surface of the water a few minutes, to dry and expand its wings, on which it presently proceeds to a dry situation. If the mosquito, when in either of the first two stages be taken out of the water, it speedily dies, and it is as speedily deprived of life, if immersed in that fluid immediately after becoming the winged insect. We learn, from the above, that the mosquito is a most prolific insect and that, as stagnant water, such as that of tanks, &c., is necessary to its pro-

MOSQUITO.

pagation, all such ought to be kept as distant as possible from dwellings; thereby we are more likely to enjoy an immunity from their annoyance, than by practising the modes so facetiously described, or rather suggested, by Captain Basil Hall in his voyages.

Almost all Easterns sleep under a sheet, which becomes a kind of respirator, defending them from the dews and mosquitoes by night and the flies by day. The "rough and ready" traveller will learn to follow the example, remembering that nature is founder of customs in savage countries; whereas, amongst the *soi-disant* civilized, nature has no deadlier enemy than custom.

It may lessen the mortification to know it is a *Sarcodes* or a *Culex pipiens*, that has outmanœuvred you, your punkah, and your curtains of net, and not an ordinary vulgar mosquito,—but it does not lessen the irritation. The thing we call a mosquito would bite as hard by any other name, they look gaunt and empty before sitting down on you, and after dinner they look fat, foxy and plethoric. Physically, they seem to be at least of two kinds, the one drab-coloured and the other speckled, each as bad as the other but worse. Morally, their divisions are legion, and a musically inclined pachyderm might reasonably expect to find the full octave among them. Even the unmusical can detect individuals by their tone. There is the speckled baritone insect that rushes at you from the other end of the garden, and with three trumpet notes proceeds to drill a hole into you, and usually gets killed for his clumsiness; for he settles on you with a confiding flop that would do credit to an able-bodied fly. But he is far preferable to the miscreant that skulks and dances behind your head for half an hour, leaving you to suspect that it has settled on your ear only by the sudden cessation of its exasperating sing-song. Some that are too hungry even to roar at you before beginning dinner, and who, blind with their horrid lust for food, pitch down on the first corner of you or your clothes that they come to, without a thought of grace, are less hateful than the dawdling dilettanti, who hover undecidedly between your ears or the nape of your neck, whining an obligato recitative in C sharp; or the others that trifle with your knuckles or ankle-bone, oscillating in a pendulous swaying flight before you, till three appear a dozen, as they pass before and behind each other. Therefore, of the two mosquitoes the lesser criminal which begins first, is more pardonable than the procrastinating villain, who, you know, will

MOSUL.

ultimately attain his end out of sight and probably out of reach of scratching. The worst part of a mosquito bite is the lively apprehension of it.—*On leave in my Compound. Burton's Pilgrimage to Meccah Vol. I. p. 35. Tennent's Sketches of the Nat. Hist. of Ceylon, p. 434. Mr. T. W. Adkinson's Adventures in Oriental and Western Siberia, Mongolia, &c., Eng. Cyc. Scandinavian Adventures, by J. Lloyd. On the Metamorphoses of the Mosquito W. Gilchrist, Esq., of the Madras Medical Establishment.*

MOSS, the order Musci of botanists, small plants with very delicate tripled roots and a simple branched stem. The musci are arranged into two tribes, viz: the Andreae, which comprises the genera Andreae and Acrostichum and the Bryae, with the genera Bryum, Mnium, Polytrichum and Sphagnum. The club-moss, belongs to the order Lycopodiaceae with the genera Lycopodium, Selaginella. The very fine powder discharged from the spore cases of lycopodium, called vegetable brimstone, is very inflammable but burns with such rapidity that it does not set fire to bodies with which it is in contact. The Iceland moss is the Cetraria Islandica, and a decoction of it forms, when cold, a thick jelly. On the upper Chenab a beverage is prepared from the thick rhizomoid roots, and lower leaves (mingled with moss, &c.) of a small herbaceous plant, with scabrous leaves. This plant, in Tibetan, is called Sbauja.—*Hogg Vegetable Kingdom, pp. 841-842, Powell Hand Book.*

MOSTARDA, PORT. Mustard seed.

MOSTAZA, SP. Mustard seed.

MOSTERD, DUT. Mustard seed.

MOSUL is a walled city, with eight gates, standing on the right bank of the Tigris. It contains about 20,000 families, Turks, Christians, and Jews, who still carry on some commerce with Kurdistan, Diarbekr, Baghdad, and other provinces, chiefly by caravans. On the left bank, both above and below Mosul, are the ruins of Nineveh, the walls of which city extended about 3,100 yards along the river, and nearly the same distance towards the interior. At about 28 miles by the river, and 20 miles in direct distance south. 12° east, below Nineveh, is the celebrated mound, or dyke of solid masonry, called Zikr-ul-awaz, or Nimrud, which crosses the bed of the river, and at seven miles, lower there is a dyke, called Zikr Ismail, similar to the former, but in a more dilapidated state. Mosul, is the Mes-Plyas of Xenophon. Here the Tigris rarely exceeds 250 yards, and its population and trade have greatly diminished since the time, prior to the discovery of the Cape passage.

MOTACILLIDÆ.

when it was the thoroughfare for the caravans, between Europe and India. It formerly enjoyed a high reputation for the manufacture which derives its name from the town and is known in France as mousseline and in English as muslin. At a short distance is the mound and village of Nebbi Yunus, in which is a mosque which covers the supposed tomb of the prophet Jonah.—*Euphrates and Tigris*, Col. Chesney, p. 21. MOSUL TAYLI, TAM. See Sand-binding plants.

MOSUMOOSAKEI KEERAY, TAM. *Brionia scabra*.

MOTA, a large town in Godjam in Abyssinia, said by Dr. Beke to contain 3,000 inhabitants.

MOTACILLA, a genus of birds of the family Motacillidæ. In S. India the pretty, little, clean-looking, sprightly water wagtail, is usually the first and most welcome harbinger of the coming cold weather, and remaining in India abundantly whilst the cold season lasts; this and our little piebald friend the water wagtail, in its season, and the common sparrow, at all seasons, but so abundant as to be overlooked and forgotten, are probably all that the European reader, unversed in the study of ornithology, will be able to recall to mind, as yielding associations of home; the pied wagtails of India 'Motacilla luzonensis and M. dukhunensis' are specifically different from those of Europe. M. alba and M. yarrellii, however similar in appearance and habits; but the grey wagtail of Britain 'Calobates sulphurea' is identically the same in India and Java, and a specimen has been seen in a collection from Australia. This delicate little bird, so clean and bright in its appearance, is of very general diffusion over Southern Asia during the cold season, being indeed much commoner than in Britain; an individual of the Motacilla boarula is occasionally to be seen. The pied wagtail, Motacilla dukhunensis is very plentiful; it is one of the wagtails of India and with the Motacilla luzonensis, another of the pied wagtails of India, is specifically different from those of Europe. Perhaps, if more was known of the general distribution of this species and the pied wagtail of Western India 'M. dukhunensis,' also the well known European bird, the slight differences in plumage would scarcely permit us to separate them. The great pied wagtail the 'Motacilla maderaspatana'; is rare.

The yellow-wagtail lark is the Budytes viridis, the feathers on its head are blue-gray in spring and summer, *Cal. Rev. Blyth. Adams*. See Birds.

The eastern nations deem the term mother, to be one of the most reverential that can be used, towards a woman and the expressions, big mother, little mother, are acceptable to all, aged women or spinners. Genesis xxiv relates how they blessed Rebekah, and said unto her, Thou art our sister, be thou the mother of thousands of millions, &c. Similar addresses to a daughter when she is going from her father's house to live with her husband are very common among the hindoos; such as, 'Be thou the mother of a son.' 'Be thou the wife of a king', &c. I remember says Colonel Tod, in my subaltern days, and wanderings through countries then little known, one of my Rajpoot soldiers at the well, impatient for water, asked a woman for the rope and bucket by the uncivil term of *rand*, meaning widow; "Myn Rajputni che," I am a Rajputni," she replied in the Hara dialect, to which tribe she belonged, "aur Rajpoot ka ma cho," 'and the mother of Rajpoots.' At the indignant reply the hands of the brave Kulian were folded, and he asked her forgiveness by the endearing and respectful epithet of "mother." It was soon granted, and filling his brass vessel, she dismissed him with the epithet of "son," and a gentle reproof. Kulian was himself a Rajpoot, and a bolder lived not, this was in 1807 and in 1817 he gained his sergeant's knot, as one of the thirty-two firelocks of Col. Tod's guard, who led the attack, and defeated a camp of fifteen hundred Pindaries.

There are few of the lowest Rajpoot chieftains, whose daughters are not instructed both to read and write; though the customs of the country requiring much form in epistolary writing, only the signature is made to letters. But their intellect, and knowledge of mankind will be acknowledged by

MOTHER-O'-PEARL.

whoever has had to converse with a Rajpoot-guardian of her son's rights. Though excluded by the Salic law of India from governing, they are declared to be fit regents during minority; and the history of India is filled with anecdotes of able and valiant women in this capacity.—*Tou's Rajasthan, Vol. I.* pp. 641, 642.

MOTHER-O'-PEARL.

Nacre, ENG. *Indung mutigara*, MALAY. Chip, GUJ. HIND. PERS. *Sipi*, HIND.

Mother-of-pearl, or Nacre, is the hard, silvery, internal layer of several kinds of shells, especially oysters, the large varieties of which in the Indian seas secrete this coat of sufficient thickness to render the shell an object of commerce. The Conchiferous, shell-fish, furnishes the finest pearls as well as mother-of-pearl: it is found round the coasts of Ceylon, near Ormus in the Persian Gulf, at Cape Comorin, and in some of the Archipelago and Australian seas. The dealers in pearl-shells consider the Chinese from Manilla to be the best: they are fine, large, and very brilliant, with yellow edges. Fine large shells of a dead white are supplied by Singapore. Common varieties come from Bombay and Valparaiso, from the latter place with jet black edges. South Sea pearl-shells are common with white edges. The beautiful dark green pearl-shells, called ear-shells or sea-eurs, are more concave than the others, and have small holes round the margin; they are the coverings of the *Haliotis*, which occurs in the Californian, South African, and East Indian Seas. In the Indian collection of the Great Exhibition, specimens of the finest mother-o'-pearl-shells were shown, such as the *Melesgrina margaritifera*, *Haliotis gigas*, *Haliotis iris*, and a large species of *Turbo*, which shells are known in commerce as flat-shells, ear-shells, green snail-shells, buffalo-shells, Bombay shells also furnish mother-o'-pearl. Mr. Banks states that the shores of the Socloos Islands afford the finest shells. The beautiful tints of mother-of-pearl

MOTHRUS.

depend upon its structure; the surface being covered with a multitude of minute grooves which decompose the reflected light. It is in consequence of this lamellar structure that mother-o'-pearl-shells admit of being split into laminae for the handles of knives, for counters, and for inlaying. Splitting, however, is liable to spoil the shell, and it is therefore avoided as much as possible. The different parts of the shell are selected as nearly as possible to suit the required purposes, and the excess of thickness is got rid of at the grindstone. Mother-o'-Pearl shell is obtained on the Australian Bank. The Mother-o'-Pearl shells of the Arru Islands and Sulu, sell at £3 2-6 per 133½ lbs. avoirdupois. The Mother-of-Pearl from the Red Sea is taken to Jerusalem, and there made into chaplets, saints' figures, and crucifixes for christian pilgrims. At Meccah it is worked into rosaries for the Haji or pilgrims. In Europe and China it is made into buttons, in ornamentation of the papier mache work, cabinet and ornamental work, which cause a considerable demand for it. Some good pearls are procurable in the Red Sea. Mother-o'-Pearl shells and tortoise-shell are brought to China from the Archipelago and the Islands of the Pacific, but a large part is re-exported in the shape of buttons, combs, and other productions of Chinese skill. The shells of the pearl oyster are of almost as much value as the pearls, the nacre of these shells being extensively employed in manufactures for useful and ornamental purposes. Other shells however have a large uacreous surface: one kind called silver lipped is imported to Liverpool; another kind called black lipped is brought from Manilla and a smaller shell from Panama. Corn and Mother-o'-Pearl, although seen in India, these and all the inferior gems are held in but little esteem by the people who value a gem for its intrinsic price not for the workman's skill expended in shaping it, in which the chief value of all the inferior gems consists.—*Ousley's Travels*, Vol. i., p. 211. *Chambers Ed. Journ.*, June 1868. *Tomlinson, Cat Ex. 1862*. *Burton's Pilgrimage to Meccah*, Vol. I., p. 265. *Williams*.

MOTHER OF THYME. *Thymus chamædryas*.

MOTHIA THUG. A class of thugs who resided chiefly in Rajpur and Dinajpur usually following the business of weavers, said to be so termed from giving their leaders a handful (*Mutha*) of rupees from each man's share, in addition to their own.

MOTHRUS. BENG. HIND. *Les-pau*, BURM. *Bombax pentandra*, and *Bombax*

MOTHS.

heterophylla, are two common trees found in every part of the Pegu forests which yield an astringent gum resin, called in the bazaars of Bengal mothrus, from the abundance of trees affording it, it might become an article of some importance.—McClelland.

MOTHS are winged insects, of the class Insecta and order Lepidoptera, and the tribe Sphinges. The better known species of the East Indies are as under :—

Tribe, ii. Sphinges.

Stirps, ii. Larvæ elongatæ.

Sesia hylas, Linn., N. and S. India, Darjeeling, Canara, Penang.

Sataspes infernalis, Westwood, Silhet.

Macroglossa stellatarum, Linn., China.

MOULMEIN TOWN, in L. 16° 30' N.
and Long 97° 38' E. is built on the left bank
of the Moulmein river immediately below
the junction of the Gyne and the Ataran.
The native race of Pegu, Moulmein, Amherst
and Martaban is the Mon whom the Burmese
call Talieng, their Siamese appellation being
Ming-Mon. Part of the Mon population
dwell on the Delta of the Irawadi, and
the same names Mon or Talieng are given
to the vernacular language of Pegu. The
alphabet, like that of the T'hay and Bur-
mese, is of Indian origin, being essentially
that of the Pali form of speech, and like all
alphabets of this kind, it embodies a bud-
dhist literature. The Mon language is quite
unintelligible to a Burmese or Siamese.
The population of Moulmeiu Town, in 1862
was 65,040.

Europeans,	2,364	Bengal,	6,503
Burmese & Arraka-		Mahomedans of Bur-

In Southern India, the highest peak, Doda-
betta (8,460 feet), is situated in the Nilgiris.

Of the peaks in the central parts of Cey-
lon, the Peduru tulla Galle reaches about the
same height, rising up to 8,305 feet; the
well-known Samanala, or Sripada (Adam's
Peak), attaining 7,385 feet.

In the mountain chains of Central India,
in the Vindhya and Aravalli ranges, the
peaks are considerably lower, Abu being
3,850 feet, and Rajmirkarb, 3,753 feet.

The Kalsubai, the highest peak of the
Dekhan, attains only 5,400 feet.

In the Himalaya, Gaurisankar or Mount
Everest (29,002 feet), is the highest peak in
the world yet discovered; it is 6,000 feet
higher than the dominating peak of the
Andes, and 13,220 feet above the most ele-
vated parts of the Alps.

The highest peaks of the Karakorum are
the Dapsang (28,278 feet), the Diamer
(26,620 feet), and Mashcribrum (25,626
feet).

Table of the principal peaks,

A.—In India.

1.—Nilgiris.

Dodabetta.....	Feet 8,640	Kundamoyu.....	Feet 7,816
Bevoibetta.....	8,388	Tambarbetta.....	7,292
Makurti.....	8,402	Kokabetta.....	7,267
Daversolabetta.....	8,380	Urbetta.....	6,915
Kunda.....	8,353	Daverbetta.....	6,571

2.—Ceylon.

Peduru tulla Galle.....	8,305	Samanala, or	} 7,385
Kirigalpotta.....	7,810	Adam's peak.	
Totapella.....	7,720	Narmina Kali.....	6,760

3.—Central India.

Parasnath.....	4,469	Kalsubai.....	5,410
Abu.....	3,850	Dhorup.....	4,745
Rajmirkarb.....	3,753	Varada.....	4,655
Bubul.....	3,353	Torna.....	4,619

4.—Dekhan.

Gaurisankar, Foot. 29,002	Barathor... Foot. 20,069
Kanchinjanga..... 28,156	Yangma..... 24,000
Sihaur..... 27,799	Nanda Devi..... 25,749
Dhavalagiri..... 26,826	Ibi Gamin... .. 25,550
Yassa..... 26,680	Narayani..... 25,450
Jiljibia..... 26,306	Jannu..... 25,304

C.—In the Korakorum,

Dapsang..... 28,278	Mosheribrum..... 25,626
Diamer..... 26,629	

D.—In the Kuenlun,

the peaks seem not to exceed 22,000 feet. In the Himalaya, the lowest height at which snow has fallen in winter is about 2,500 feet; but such cases are extremely rare, having occurred in Kamaon and Garhwal only twice (in 1817 and 1847), since the British took possession of the country. At an elevation of 5,000 feet scarcely one year in ten passes by without snow-fall; but at this height the snow disappears after a few days, and sometimes even hours. "It snows, but one does not see it," said the natives of Kathmandu (4,354 feet) meaning, that the rare nightly snow-falls are melted away by the earliest rays of the sun: 6,000 feet may be assigned as the limit where snow regularly falls in winter with a probability of remaining some time upon the ground.

In Western Tibet and in the Korakorum the general elevation of the country is so great even in its lowest regions, that no part lies below the limit of hibernal snow-fall.

In the Kuenlun, even on its southern slope a greater amount of snow is precipitated than on the northern side of the Korakorum, while its Turkistan (northern) slopes differ still more from the Korakorum in this respect.

The values obtained for the height of the snow line on the three mountain chains of High Asia are:

a.—Himalaya.	
Southern (Indian) slopes.....	Feet. 16,200
Northern (Tibetan) slopes.....	17,400
b.—Korakorum.	
Southern (Tibetan) slopes.....	19,400
Northern (along the Turkistani plateau).....	18,600
c.—Kuenlun.	
Southern (facing mountainous ramifications).....	15,800
Northern (facing the Turkistani plain).....	15,100

The following mountains and points in the environs of Massuri were determined by the Great Trigonometrical Survey of India, under General Sir Andrew Waugh.

A.—Mountains.

Hiatipam....	Feet. 7,109	Eagle's Nest..	Feet. 7,041

Central Asia is a term used differently by geographers, ethnologists, and politicians, but is usually applied to the region intervening between Russia in Asia, and British India, and lying to the west of Chinese Tartary. Its western boundary is the Caspian Sea and the river Ural. On the east, is the lofty table-land of the Bolor (the mountains which form the western boundary of Chinese Turkestan and Dzungaria), and the river Irtysh; and the northern boundary is western Siberia, and it has Afghanistan on the south east; on the eastern side of Central Asia, is a fertile tract, watered by the great rivers the Jaxartes and the Oxus. The whole country of Central Asia between India

MOUNTAINS.

and Tartary is one broad mountain range, the Himalaya forming the southern crest, and the Kuen-luen the northern. The interior has some lovely valleys like Kashmir, but it is more usually broken into rocky ravines, through which the affluents of the Indus force their way towards the plains; or else stretches away in those vast treeless uplands, which are one of the chief characteristics of the range through its whole extent. The ascent from Yarkand and Kashgar, westward to the table-land of Pamir, is almost imperceptible: and when that lofty position is gained, where the average elevation is probably as much as 15,000 feet above the sea, a vast open plain is seen, which stretches from the valley of the Jaxartes in one direction, across the head streams of the Oxus, to the top of the Kashgar or Chitral Valley in another. This plateau may be 700 or 800 miles in extent. It is studded throughout with lakes, and from it descend four great river systems. The Naryn, which is the main stream of the Jaxartes, runs through a long, luxuriant valley, between the culminating ridge and outer range of the Thian Shan, and drains all the northern range of the plateau. The Oxus, rising in the Sari Kul or Yellow lake of Pamir, at least 300 miles to the south of the Jaxartes, receives from its right bank a multitude of small streams, which run to the south through rugged valleys, on the south-western face of the Pamir uplands. The western face of Pamir between the Jaxartes and the Oxus, is far more precipitous than the eastern. Ridges run out as far as Samarcand and Kurshi and the streams from the upland which twine amongst these ridges form the Zarafshan and Karshi part of the water system of the Oxus, though before they reach that river they are entirely consumed in irrigation.

The Kuen-luen, mountain chain, as seen from Sumgal in Turkestan is in lat. 36° 8' N., and long. 78° 5' E., and is 13,215 feet above the sea. The Kuen-Luen is the northern crest of the great range which bounds the high table-land of Thibet. This range is the true water shed between India and Central Asia, the Indus absorbing all the streams which flow from the southern slopes of the range, while the northern rivers which form the Kara Kush force their way through or round the outer barrier of the Kuen-Luen, and wend northward to the Gobi or Sandy desert. In the Kuen-Luen, all passes above 15,000 feet, are closed in winter by the heavy snow-fall. The following are the principal passes in India and the world;

(a) These two passes cannot be used for practical purposes.

It has often been observed that the Koh-i-Kush offers a plausible etymology for the Caucasus of the classical writers. It is supposed by Ritter and Wilford to be the mount mentioned by Pliny under the name of Graucasas, but slightly deviating from the Sanscrit Gravakasas meaning shining rock. The only known route across the Hindoo Koosh range, fit for artillery or wheel carriages, is the Bamian pass.

The heights of the following localities have been ascertained as under:

MOUNTAINS.

The Thian-shan mountain chain has three characteristic divisions, from the meridian of Kucha 82° 48' E, to its intersection with the Bolor. To the East, from the transverse course of the Aksu to Kucha, the celestial mountains rise in a towering ridge, covered with perpetual snows, which feed enormous glaciers, and are therefore called the Muzart or Icy mountains. There is only one pass through the Muzart mountains, which is called by the Chinese "the pass of Glaciers" and by Humboldt "Djoparle." Through this pass there is a road leading from Kuldja, 45° 54' N., 80° 58' E. to Aksu.

The Bolor mountains, otherwise called Alai by the Andijans, are precipitous and inaccessible on their western face, and form on the east a high, cold plateau, visited only in the summer by the Kirghiz. There is only one caravan road over the Bolor, which passes through Badakshan. This Badakshan road is said to be very fatiguing, and, at best is not practicable on horseback. The road through Badakshan to Yarkand leads to Khulm, thence to Bokhara, Balkh, and Cabul, caravans requiring sixty-five days to reach Bokhara by this route.

The Pamir is intersected by roads well-trodden by the Kirghiz; all of which lead to the khanate of Kokan, or to Karatagin.

Over the Kuen-lun one pass is known, that of Kara-Korum, by which Eastern Turkestan communicates with Tibet and India.

Eastern Turkestan is enclosed by mountains on three sides: by the Thian-shan on the Northern, the Bolor on the Western and Kuen-lun on the Southern. These mountains belong to the highest ranges of Central Asia, and form the natural limits of the western portion of the Chinese Empire.

The actual boundary, however, runs along the line of pickets stretching through the outlying lower ranges on the Chinese side, beyond this frontier the territory is occupied by roaming Kirghiz, who recognize the authority of the Kokhan Khan. To the eastward, Eastern Turkestan is bounded by the uninhabited sandy deserts of the Makhai and Kamul Gobi. It occupies consequently a plain between 36° and 43° North latitude, and 70° and 90° East longitude, from the meridian of Paris. Eastern Turkestan occupies the centre of the table-land of Eastern Asia; but Humboldt, guided by the vegetable productions of these parts, concludes that the plain of Little Bokhara cannot have an absolute elevation of more than 1,200 feet, and calls it the Tarym depression after the river Tarym-gol (otherwise Ergol), whose basin occupies the whole plain of Eastern Turkestan. Little

MOUNTAINS.

Bokhara does, in fact, present the appearance of a great depressed valley, resembling, in physical features, an open plain; and this general view receives confirmation from a consideration of the course of the river Ergol, whose bed slopes very gradually to the eastwards. The interior of this country is a sandy desert, the peculiar features of which first become visible in the eastern slopes of an undulating range of hills, of no great width, between Yanyshahr and Yarkand. From this region it gradually widens as it runs to the eastward, where it forms the vast Gobi, devoid of all vegetation, though interspersed with reservoirs of brackish water, and where the sand is heaped in such lofty ridges that the inhabitants give them the name of "Gag" (mountain). If we are to credit native writers, this sand is subject to the same phenomena of drifting and regular locomotion as the famed moving desert of Africa, and occasionally buries whole cities. The parts that lie at the foot of the mountains have a clayey soil, strewed with small stones, and in some places impregnated with salt. The numerous rivers running from the neighbouring hills afford means for the artificial irrigation of the earth, which would otherwise yield but scanty and poor vegetation, owing to the extreme dryness of the air; and, at best, there are but a few well-watered parts that form fertile oases. These cultivated and peopled patches form a ring round the base of the Thianshan, Bolor, and Kuen-lun. The water system of the river Tarym, with its tributaries, relieves the interior of this desert, by a narrow strip of fertile land along the various river courses, where the fertility of the soil admits of a rude system of cultivation.

Jullundhur. The higher portion of the Jullundhur is a tract abounding in mineral wells of all descriptions, where the icy stream of the Parbutti, close to the boiling fountain of Munneekarn, which rises in a jet at an elevation of 5,587 feet could furnish Russian baths, if they were desired, and where the immediate vicinity of a chalybeate is not to be forgotten: where some are reported to contain Iodine or Bromine (the asserted presence of less than $\frac{1}{2}$ of a grain of bromide of potass, with the merest trace of iodine, in 16 ounces of the water, was the making of the saline of Kreutznach), and where some must possess the advantage of an almost European climate. In this district also and on the banks of the Beas, is Bishiht, at an elevation of 6,681 feet, with an ample thermal sulphuretted source.

MOUNTAINS.

Beluchistan. The mountainous table-land of Beluchistan extends from Cape Monze, in the south to the Afghan mountains north of Qnetta, or from 25° to $30^{\circ} 40'$ N. latitude, and is consequently about 340 miles in length. The great central mountain range or table land, running north and south, comprises the provinces of Sarawan, Jhalawan, and Las. The Brahui appear to have been a nation of Tartar mountaineers, who settled, at a very early period in the southern parts of Asia, where they lived an ambulatory life in khel, or societies, headed and governed by their own chiefs and laws, for many centuries; and at length they became incorporated, and obtained their present footing at Kelat and throughout Beluchistan. It is impossible to form more than a supposition what was the nature of the region from which they emigrated, but their pursuits and way of domestic life afford the strongest reason for believing that they were originally mountaineers; and some amongst them affirm that the very name demonstrates this by its signification being a compound of an affix boan and roh, a word said to mean a hill in the dialect still spoken in some parts of Tibet; such reasoning, however, is not entitled to any great dependence, though supported by the collateral evidence of the Beloochees, being called in one quarter of the country Nharui, which, if we admit the former derivation, means "lowlanders," i. e. literally not hill-men, a name they receive from the Brahui when they came amongst them, and evinced a preference for the champagne districts, low villages, and plains. The Brahui imagine themselves the aborigines of the country.

Continental India, its primary divisions are four:—Hindustan, in the widest sense of that term, including the whole Western Peninsula and the Gangetic plain to the base of the Himalaya. 2. The Himalaya, a mountain chain which rises abruptly from the Gangetic plain, and is connected with a still loftier mountain mass (of Tibet) to the north, and beyond India. 3. Eastern India, India ultra Ganges, including the kingdom of Ava and the Eastern or Malayan Peninsula. 4. Afghanistan. These divisions are marked out by great mountain barriers and by the ocean. The Himalaya mountains on the north are nowhere under 15,000 feet, usually exceeding 17,000 and 18,000 feet and rise in isolated peaks or groups of peaks from 21,000 to 28,000 feet. The name in Sanscrit, signifies the abode of snow, or home of snow and is sometimes written "Himmalesh" conformably

MOUNTAINS.

to the pronunciation. To the Greeks and Romans, part of the Himalaya was known as the Imaus, and Pliny, (Hist. Nat. VI. 17) was aware of the signification of the name for he says Imaus, incolarum lingua nivorum significans.

The direction of the Himalaya range is not parallel to the equator, the western extremity being the most northern. Its height is nowhere below 15,000 feet, usually exceeding 17,000—18,000, and rising in isolated peaks, or groups of peaks, to from 20,000 to 28,000. The mountain mass of Asia, sinks to the westward of Afghanistan, rising again only in isolated peaks; and hence the Himalaya is rather ideally than really connected with the mountains south of the Caspian, and so with the Caucasian Alps on the one hand, and those of Asia Minor on the other. The Afghan mountains form a meridional chain from the western extremity of the Himalaya, descending parallel to the Indus, with a gradually decreasing elevation, from above 15,000 feet, to the level of the sea, at the Arabian Gulf. The Ava and Malayan mountains form a chain parallel to these which is given off from the snow-clad mountains of East Tibet, and though rapidly diminishing in elevation, is continued uninterruptedly almost to the Equator. In the Peninsula of British India the Western Ghats extend from Cape Comorin to the Tapti river. The Vindhya chain crosses the centre of Hindostan from the Gulf of Cambay to the Ganges. The Aravali mountains, extending from Hansi and Delhi to Gujerat. The Peninsular chain forms a continuous watershed, throughout its length of upwards of nine hundred miles, scarcely deviating from a straight line, which is parallel and close to the west coast of the Peninsula, and perpendicular to the direction of the monsoons. This chain divides the Peninsula of India unequally into two portions, marked by different climates, a narrow western one, including the provinces of Malabar and the Concan; and a broad eastern one traversed consequently by all the great rivers, and including the Carnatic, Mysore, and the Dekhan.

The Vindhya chain, consists of two parallel ranges, connected towards their centres, where the table-land of Umarkantak is said to attain an elevation of 4,500 feet; elsewhere they are separated by the great rivers Son and Narbada, which rise together and flow in opposite directions. The more southern of these ranges is probably always the higher of the two, but it appears seldom to exceed 3000 feet. The Vindhya moun-

MOUNTAINS.

tains were known to the Greeks as the Vindian: they separate the Ganges and its tributaries from the Mahanuddy, etc. which flow south-east to the Bay of Bengal, as also from the Tapti and Narbada, which flow west to the Arabian Sea.

The Siwalik is a sub Himalayan range of the later or tertiary formation. What is strictly called the Siwalik, extends in a north-western direction from the right bank of the Ganges, and runs parallel to the Himalayan range, forming the boundary of the Doab between the Ganges and Jumna; beyond this, it skirts the Ambala and Ludhiana districts, and comes to its termination in the Hashyarpur district. Though this portion alone receives the name of Siwalik, Dr. Royle observes that hills of a precisely similar nature can be traced all along below the Himalaya from the Sutlej, as far as the foot of the Sikkim hills: and it is not difficult to conceive a continuation of them more or less unbroken, and of greater or less elevation, along the whole southern frontier of the Himalayan system, a distance of nearly 800 miles. At Hardwar, the Siwalik hills form the gorge at which the Ganges issues into the plains of Hindustan. The breadth of this range is at its widest part about ten miles when it approaches the Sutlej river, and towards its termination beyond that river, the range assumes the form of little more than sandhills. The highest part of the range is about Hardwar, and to the south of Garhwal, beyond Sirmur, some of the peaks are as high as 3,000 or 3,500 feet above the sea level. The range is of tertiary formation all alluvial, and in many places consisting of beds of gravel and rolled stones, fragments of the older formations of the Himalayan range above, consisting of granites, limestone, clay-slate, gneiss, mica-schists, &c. Besides these there are beds of loose grained sandstone, with much mica interposing, there are also beds of calcareous conglomerate and subordinate beds of clay. The clay and sand beds of these ranges are fossiliferous: shells of the tertiary miocene period abound, but the chief characteristic fossils are the remains of gigantic mammalia, among which may be mentioned the Sivatherium, a huge creature somewhat similar to the "tapir" of modern days. The name Siwalik is derived from the hindu divinity Siva. Dr. Falconer, on his first visit to the Siwalik hills, inferred that they were of a tertiary age, and analogous to the Molasse of Switzerland. Thirty years of subsequent research by other geologists has not altered that determination, although our exact knowledge of the formation has

MOUNTAINS.

been greatly extended. The researches thus begun were followed about the end of 1834, by the discovery by Lieutenants Baker and Parand, of the great fossiliferous deposit of the Siwalik, near the valley of Markanda, westward of the Jumna, and below Nahun.

North West Himalaya. Between the river Indus and the plains of North West India is interposed a mountain tract which has a breadth of about 150 miles in linear distance. One chain forms the line of separation between the waters of the Indus and those of the Chenab and Jelum. To the eastward of the Baralacha Pass it ramifies to a considerable extent its different branches, including between them several depressions quite unconnected with the general drainage of the country, and surrounded on all sides by ranges of hills which prevent any exit of their waters. The principal of these depressions is that of the slightly saline lake Chumoreri; another is occupied by the little salt lake first visited by Trebeck, and called by him Thogji.

All these depressions, though at present unconnected with any of the river systems, have evidently at some former period been so. Chumoreri, according to Major Cunningham, is even now very slightly saline, though scarcely perceptibly so to the taste. It has evidently had an outlet at its southern extremity, where it is only separated from the valley of the Parang river by a very low range of hills, which was crossed in 1846 by Mr. Agnew, and since then by Captain H. Strachey. The outlet of the little salt lake of Thogji has evidently been near its north end, and its waters, previous to the change in the state of the country which interrupted their exit, in all probability flowed into that tributary of the Zaskar river which runs to the eastward of the Labalang pass, and which is marked in the map accompanying Moorcroft's Travels as the Sumghiel. The mountain chain which lies to the south of the river Sutlej may also be considered to have its origin in the lofty country adjoining the lakes, but a little to the south and east of them. This chain, which separates the valley of the Sutlej from that of the Ganges and its tributaries (including the Jumna), sinks at last into the plains of India a little to the south of the town of Nahun. The course of this chain has been admirably described by Capt. Herbert in his Geological Report of the Himalaya, a paper which contains exceedingly accurate general views of the mountains between the Sutlej and Jumna. Captain Herbert, travelled a great deal in the Himalaya, and was the first to point out the impropriety of regarding these

MOUNTAINS.

mountains as a single chain parallel to the plains of India. Jacquemont also arrived at the same conclusion, as will be seen from the following extract from his journal:—"Le langage de la géographie descriptive est théorique; c'est une grande faute si les théories qu'il rappelle sans cesse sont dénuées de fondement. Ainsi l'on dit que le Setludje coupe la chaîne centrale de l' Himalaya, que sa vallée est creusée au travers, etc. etc., et l'on donne à penser par là que cette chaîne auparavant était continue et que c'est par un effort des eaux que s'y est faite cette large trouée, comme si les montagnes avaient dû se former primitivement avec une continuité non interrompue (vol. ii. p. 201); and again (at p. 269.) Le Setludje coule donc non au nord de l' Himalaya, mais entre deux chaînes a peu près également élevées." Captain Herbert calls the chain south of the Sutlej the Indo-Gangetic chain, a very inappropriate name, for which, however, it is difficult to substitute a better. Perhaps the name of Cis-Sutlej Himalaya, though not exactly classical, is the best that can be devised, and if so, the chain which, commencing in Kailas, separates the waters of the Sutlej from those of the Indus, may not improperly be designated the Trans-Sutlej Himalaya. Captain R. Strachey, in this paper, on the snow level, purposes to call the more western part of the Cis-Sutlej Himalaya the Buschir range, a name which, though exceedingly appropriate to the portion to which he applies it, is not adapted for extension to the more eastern part.

Kouenlun. The northern boundary of Tibet is formed by the great chain north of the Indus, to which Humboldt, following Chinese geographers, has given the name of Kouenlun. Our knowledge of the appearance and course of this chain of mountains, by which Tibet is separated from Yarkand and Khoten, is so extremely limited that, except as to its general direction, very little can be said regarding it. There do not seem to be more than four places in which passes exist across the Kouenlun.

The most westerly of these, called in Balti the pass of the Muztagh, lies at the source of the right branch of the Shigar river, a stream which joins the Indus opposite the town of Iskardo. The road over this pass to Yarkand was formerly frequented by merchants, but has, for many years, been disused, the reason assigned being the danger of plunder by the hordes of robbers beyond. As described by persons who had crossed it, the snow is reached after ten days' journey from Iskardo, and continues during three marches. It is said to be quite im-

MOUNTAINS.

practicable for horses, from which it may be inferred that there are numerous glaciers.

The second pass is that marked in Vigne's map as the Alibranza pass, at the head of a considerable tributary which joins the Shiyuk river opposite Khapalu. The enormous glacier over which this road runs, by which, in conjunction with the lateness of the season, Mr. Vigne's attempts to cross the pass were frustrated, has been well described by that traveller. Dr. Thompson did not, while in Tibet, meet with any one who had crossed it, and he was assured by the inhabitants of Nubra that they were not acquainted with any road from the upper part of their valley, either towards Khapalu or towards Yarkand.

The third pass, and the only one now frequented, is that of the Karakoram, an extremely easy though very elevated one.

The most easterly pass of which there is any notice, occurs on the road between Ruduk and Khoten; it is mentioned by Moorcroft, but without any account of the nature of the road, or the elevation of the mountains.

It cannot be doubted, from the description of the Pangong lake given by Moorcroft and Trebeck that the basin in which it rests had originally an outlet at its north-west extremity, discharging itself along the valley of Tankatse into the Shiyuk.

The Himalaya consists not of one but of a vast series of ranges; those towards India form Himalaya proper; those towards Tibet and Central Asia, forming the Kuenlun or Tibetan chain still loftier than the Himalaya. The Himalaya includes only those mountains below the line formed by the Indus and Brahmaputra rivers, these two rivers rise close to each other, but flow in opposite directions, forming a long line till at either end of the chain, they turn abruptly south and form the limits of the Himalaya proper. Thus defined, the Himalaya may be divided into eastern, central and western ranges.

The Bara Lacha range of mountains is regarded by Alexander Cunningham as the western continuation of the Himalaya. The Bara Lacha separates the Indus river from its first affluents as the Eastern Himalaya separates the Tshang-po from the Ganges.

Eastward of the Subansiri river, there is probably only one range of any considerable elevation and the mountains by which the Himalaya terminate in that direction perhaps nowhere attain a greater height than eight or ten thousand feet, while the valley of the Dihong or Brahmaputra is probably broad and open. These mountains are inhabited by wild and suspicious tribes.

MOUNTAINS.

In the Western Himalaya, the average elevation of Cashmere valley is between 5,000 and 6,000 feet above the sea. Haramuk Mount 13,000. Pir-panjal, 15,000. Average of the valley of Indus (N. of Cashmere vale), 6,000 to 7,000 feet. Mountains on each side rising from 6,000 to 8,000 feet higher. Mountains enclosing Cashmere vale are basaltic.

In the Western Himalaya, taking as a starting point, the great peaks above the Mansarowara lake, near the 83rd parallel of longitude and 31st of latitude, roughly estimated, we find a marked chain, containing the Karakorum mountains, running north-east. This range forms the northern boundary of the provinces of Balti, Nubra, Pangong and Nari-khorum. Another range below this forms the boundary of the provinces Gungo, Ladakh and Dras. Below this runs the Indus, and then enclosing the valley of the Indus there is another chain which forms the boundary of the provinces of Dras, Zaskar and Parang; below these is the central range of the real or Indian Himalaya. Between the ranges just mentioned, there is of course a vast system of subordinate chains varying in height.

The main range of the western Himalaya, commencing about Mansarowara, and running north-east, terminates at the great peak (20,000 feet) of Dayamar, or Nanga Parbat. Here the range rapidly sinks towards the Indus. At this point also the two ranges which enclose the Khagan valley (traversed down the centre by the Nainsukh river) strike off in a south-easterly direction, and separate the Himalaya from the system of the Hindu Kush and Safed Koh, beyond and below it. The central range of the west Himalaya runs nearly parallel to the Indus, and some distance south of it. The provinces which it bounds are Kanawar and Spiti, Lahaul, Kishtwar, Kashmir, and near the Indus the tract of hill country represented by Hazara and Marri. The most remarkable pendant to this central chain is the vast chain of mountains, which, starting off near the 76th parallel of longitude at the Sheshanag peak, runs round, enclosing an irregular elliptical space, and rejoins the original range, midway between the 75th and 76th parallels. The amphitheatre thus formed is the Kashmir valley; the mountain ranges enclosing it, which form as it were a loop depending from the main line, are known by the name of the Panjal, or the Pir Panjal, the snowy Panjal, the Panjal of Banihal. This chain of hills separates Kashmir from Kishtwar on the east, and from Hazara on the west.

MOUNTAINS.

The eastern portion of the central range has another range parallel to it on the south, enclosing the Chandra Bhaga or Chinab, and forming the valley of that river which runs among them. First, then, there is the Cis-Sutlej Himalaya, which runs downward towards the plains separating the Ganges basin from the valley of the Beas, including the Suket and Mandi territory. Beyond this, comes the Dhauladhar range (in which are Dharmsala and other well known places), separating the valley of the Beas from Chamba and the valley of the Ravi; and then a system, rather than a definite chain, of hills separating the Ravi from the Chinab.

Beyond the Chinab river and to the south of the great Kashmir valley, are a varied series of hills running off from the Panjab mountains, and forming the elevated country between the Chinab and Jhilam, including Rajauri. Beyond the Jhilam we have a continuation southward of that long mountain series which forms the Himalayan wall of the Kaghan valley. On this is situated the well known hill station of Murree; this range may be taken as almost the limit of the Himalaya. Beyond this we have the whole hill country of Hazara up to the Indus. Besides these ranges, there are endless subordinate divisions, some of which are so important as almost to obliterate (so to speak) the demarcation above adopted. The rocks which form the principal portions of the higher range of the west Himalaya, consist of granite and syenite, and below that of talcose and chloritic schists and slates, and other metamorphic rocks, interspersed with dykes and interruptions of trap, amygdaloid, and various volcanic rocks, pebbles of which are found in the hill streams and in the beds of conglomerate in the lower ranges. Below these come tertiary formations of various sandstones and clays, as well as of conglomerates formed of fragments of the metamorphic, volcanic and primary rocks of the higher ranges. These huge beds contain boulders often of immense size, which must have been transported by glacial agency; the conglomerate often forms whole cliffs cut into fantastic shapes by water action. The secondary, oolitic, and carboniferous formations are mostly within the Tibetan mountains of the Kuenlun; in British territory they are solely represented from the little province of Spiti, which forms the most north-eastern of British Himalayan possessions. These classes of rocks have been as yet but little studied in the Himalaya. The whole of the Sub-Himalaya ranges, through Rajauri, Jammu, below Chamba,

MOUNTAINS.

Kangra and Simla, are entirely occupied by tertiary formations of sand, clay and conglomerate; and below these again, or, more properly speaking, intermingled with them are hills of fossiliferous tertiary formations. The mountain limestone is the most abundant formation in Spiti, and abounds with species of Ammonites, Orthoceras, Spirifer, Terebratula.

The *Bura Lachri* and many other mountains, from 16,000 to 20,000 feet high, are secondary, though certainly very uncommon heights for secondary, mountains. The Khattak range continues the boundary to the Indus, maintaining an average height of from 3,000 to 5,000 feet. The Salt Range is a very well defined group of hills in its western and southern portions. Its elevation is inconsiderable, varying from 2,000 to 5,000 feet at extreme elevations; it is remarkably barren and scanty in its vegetation. The name of Salt Range has been given from its productiveness of the rock salt at the mines of Kheura and other places, an account of which has been given. (See Salt.) The range is known to natives by a variety of names; there are peaks called Karnli, Kundal, Sardi, Tilla, Bhulla, Kheura, Kas Gabhir, Kas Soj, Sangli and Chitta hills; together with many others both of the Shahpur and Jhilam districts. The Salt Range generally is called "Khawa." This range runs across the Sind Sagar doab between the Jhilam and the Indus, crossing it from east to west, between the parallels $32^{\circ} 22'$ and 33° of north latitude, and $71^{\circ} 30'$, and $73^{\circ} 30'$, of east longitude. It starts with three spurs or prongs; one on the east bank of the Jhilam and two on the right, both continue separate as far as the Buna Nalla, which joins the Jhilam river at Darapur and Rasul, and then unite into one range, which continues up to Kalabagh on the Indus.

The *Suliman Range*. The wild and lawless habits of the tribes inhabiting this range have hitherto prevented anything like a geological survey; little is known beyond what can be observed at the foot of the ranges bordering on British territory, or inferred from considerations of similarity of structure with known ranges.

Delhi, Shekhawati, and Kalayana Hills. On the other side of the Panjab territory, there remains yet to be noticed that series of low hills, from which is derived the mineral wealth of Delhi, Gurgaon and Hissar; they appear to be spurs and off-shoots of the extremity of the Aravalli range. The principal hills are the Delhi

MOUNTAINS.

Hills, in the south-west of the district of the same name, and the Shekhawati hills, in Gurgaon, &c., and the Kalayana hill, at Dadri, which yields the flexible sandstone, and the gray Narnaul marble. It is among the hills in the Delhi district that the crystalline series of Aurangpur occur, and that a white clay supposed to be kaolin is produced. The range of Delhi appears to contain limestones, marble, and some sandstone strata—the sandstones are probably Vindhyan. In Gurgaon several clays—white, red and yellow—and mica occur; also hematite and ironstone, and also copper, both at Singhana and in Hissar. Ballagarh yields white and red sandstones, and the mottled, red, and white, and blackish of the “new red” group. Within this district, detached hills are common, particularly in the pergunah of Rewa, but none of considerable size or continuance, the country in the vicinity of these hills will generally be found to be occupied by the Ranghur tribe.

Himalaya. The two sections of the Himalaya present almost insurmountable obstacles to communication between the countries which they divide, thereby separating the Boti or people of Tibet from the Hindu family of India; the distinction of climate is not less positively marked, both ranges forming the lines of demarcation between the cold and dry climate of Tibet with its dearth of trees, and the warm and humid climate of India, with its luxuriance of vegetable productions.

To the north of the Eastern Himalaya, in Tibet, lies a vast unknown tract, in which perhaps, ramify the head waters of the Yang-tse-Kiang which is identified by Chinese geographers with the Neag King of Cochin China.

Bolor Mountains, the mountains of Balti, extend for 300 miles, from the sources of the Gilgit and Yasan rivers, from 73° to the 77° E. L., the source of the Nubra river. Bolor produces much gold. The higher mountain range abounds in rock-crystal, which is consequently called the bolor-stone or rock-crystal.

Western Tibet is a highly mountainous region lying on both sides of the river Indus, with its longer axis directed, like that river, from south-east to north-west. It is bounded on the north-east by the Kuenlun chain of mountains, by which it is separated from the basin of Yarkand. On the south-east its boundary is formed by the ridge which separates the waters of the Indus from those of the Sanpu. To the north-west and south-west its boundaries are somewhat arbitrary, unless the political division of the country

MOUNTAINS.

be had recourse to, which, depending on accidental circumstances entirely unconnected with physical geography or natural productions, is so liable to change that its adoption would be extremely inconvenient. As limited by these boundaries, West Tibet includes the whole of the valley of the Indus and its tributaries, down to about 6,000 feet above the level of the sea, a considerable portion of the upper course of the Sutlej down to between 9,000 and 10,000 feet, and small portions of the upper course of the Chenab, of the Ganges (Jahnavi), and of the Gogra. Every part of Tibet is traversed by ranges of mountains which have their origin either in the Kuenlun on the north, or in the Trans-Sutlej Himalaya on the south.

Rikshavat, is the Sanscrit name of a mountain, lit. bear-having, (from riksha, a bear, and avat, alix, of possession), the mountain of bears is part of the Vindhya chain, separating Malwa from Kandesha and Berar.

The Aravali chain of hills is connected by lower ranges with the western extremity of the Vindhya mountains on the borders of Guzerat, and stretching from S. W. to N. E. up to a considerable distance beyond Ajmir, in the direction of Delhi. The range divides Rajputanah into two nearly equal parts forming the division between the desert on the west and the central table land. It would be more correct to say the level of the desert, for the south-eastern portion, including Jodpur, is a fertile country. The Aravali chain divides the tributaries of the Indus from those of the Ganges, and may hence be regarded as a continuation of the Cis-Sutlej chain of the Himalaya, which terminates to all appearance in the plains near Nahan in Sirmur. In like manner, the peninsula of Katiwar may be considered as the southern termination of the Aravali, though separated from it by an alluvial plain being the continuation of the water-shed, and dividing the streams flowing to the Gulf of Kutch or the delta of the Indus from those that flow into the Gulf of Cambay.

Central India, including the provinces of Allahabad and Malwa, is a strongly marked natural division, the country north of the Nerbudda, being crossed from east to west by the Vindhya mountains, between the 22° and 23° of north latitude, and their eastern extremity is continued onwards towards the Rajmahal hills which jut into the Ganges at Sierrygully, Pointy, and Pattengottah about latitude 25° 12' north. The Vindhya range, near their western extremity again, is met at right

MOUNTAINS.

angles by the Aravali, which run between the 73° and 76° of east longitude, northwards for 200 miles towards Delhi, and, thus enclose a triangular tract of table land elevated from 1,300 to 2,200 feet above the sea, which has received the name of Central India. In that central tract the thermometer ranges from 28° in the cold season to 98° in the hot weather, and the rains fall in July, August, and September. To the south-west and west of the Aravali, the Rajpootana countries extend as far as the river Indus, and several of them consist of sandy, inhospitable deserts with few inhabitants round the oases. This tract belongs to tributary princes who have been under British protection since the beginning of the 19th century. It is, like Central India from which it is separated by the Aravali mountains, from 1,000 to 2,000 feet above the level of the sea, the land declining to the west towards the valley of the Indus. Though deluged with rain in the rainy season, from the nature of the soil and the absence of all contrivance to preserve the waters, much of the country remains a desert; Ulwar, Jeypore, Kotah, Bundi and Udepore have very fair land, but Jesselmere, Bickanער and parts of Jodhpore or Marwar are particularly barren.

Westward of the Jumna and the Aravali range the country is flat, with but few hills, and gradually declining towards the valley of the Indus. The soil is sandy, and covered with saline efflorescence; the water brackish, and far below the surface, so that the wells are from one to three hundred feet in depth. The sand-hills of the desert are soon reached, but the most interesting object in this arid region, as observed by Colonel Tod, is the Salt river, the Looni, with its many arms flowing from the Aravali to enrich the best portion of the principality of Jodhpore, and distinctly marking that line of ever-shifting sand, termed, in Hindu geography, *Maruosthali*, corrupted to Marwar. The Looni after a course of more than three hundred miles, terminates in the great salt marsh called the Runn, which is one hundred and fifty miles in length and about seventy in breadth. This, Colonel Tod considers as having been formed by the deposits of the Looni, and equally saturated saline deposits from the southern desert of Dhat. Dr. Govan described it as a dead flat, hardly elevated above the level of the sea, and he compared it to an arm of the ocean from which the water had receded, as it is covered with saline incrustations and marine exuvie. Besides this saline efflorescence and brackish water, this tract of country is remarkable for containing many salt lakes, which,

MOUNTAINS.

by evaporation during the heats of summer, yield a tolerably pure mixture of soda, that is much used in the upper provinces. Many alkaline plants are also produced, which, when burnt, yield an impure carbonate of soda exported in large quantities into the more populous districts of Hindoostan. Small oases and large towns are found in many parts of this desert, which is traversed by dry water-courses, in every direction, as we learn from Mr. Elphinstone and Colonel Tod.

The northern parts of the tract westward of the Jumna must be excepted from the character of barrenness, as *Haryana* is celebrated for its pasturage grasses, and for the herds of cattle which it supports. The S. country also is very fertile.

Neilgherries. At the southern extremity of the Peninsula of India the Nilgiris, and its various branches of the Kunda, Sispara, and Kotagherri, are the mountain system of greatest absolute elevation in India Proper, and, exceeding as they do at several points 8,000 feet, are particularly well defined and strikingly prominent, on account of their comparatively short distance from the sea shore on either coast of the peninsula.

The Neilgherry mountains are in the southern part of Peninsular India. The Eastern Ghats are not properly a ridge, though the natives so call the first steep, which is met with to the west of the Eastern Coast. The mountain tract called the eastern ghats, commences 11° 20' N. south of the Cavery, extending to 16° N. south of the Krishna river. The western ghats commence at Capo Comorin and extend to the Tapti or Sarat river, whence they diverge to the N. E. and are lost among the hills near Boorhanpore. The Neilgherries are situated between 10° and 12° N. L. and 76° and 77° E. long. bounded on the north by the Table land of Davarajputnam, S. and E. by the open country of Coimbatour, S. W. by the Manaar river, a branch of the Bhowani; W. by the chain of ghats and N. W. by the district of Wynaad. The base of these mountains, including that of the Koondah hills, covers a circumference of 200 miles. Their greatest length is from E. to W. 46 miles, and medium breadth 15 miles: the surface is composed of ridges of different elevations. The country is divided into three Naad, viz: Peringa, Malka and Thodawar Naad. The first two are mountainous but the third is of sloping hills, and a gently undulating surface of table land. Dodabetta is 8,700 feet above the level of the sea. The people occupying these Naad, are, 1.—Thodawar, 2.—Bud-dagar, 3.—Kothur and 4.—Koorambar.

MOUNTAINS.

The *Travancore group of Mountains*, presents a striking analogy to the Island of Ceylon. They are loftiest at the extreme north of the district, where they stretch east and west for sixty or seventy miles separating the districts of Dindigul and Madura. Notwithstanding the perennial humidity, the rain-fall at Courtalam is only 40 inches; on the hills around, however, it is doubtless much greater.

The *Pulney or Palnai mountains* are west of Dindigul, the *Animalay* south of Coimbatore, the *Shevaghiri* mountains south-west of Madura, and the ranges near Courtalam, are all well known. The remarkable Palm, *Bentinckia*, so common in the Travancore mountains, is not known in Ceylon. The other palms are *Caryota urens*, an *Areca*, *Phoenix farinifera*, and one or two species of *Calamus*.

Chanda. A hill range in the Marangoon zamindari of the Chanda District, forms the highest portion of a wild mountain region two thousand feet above the sea; on the summit of which, encircled by chain upon chain of hills, all covered with the densest forest, stands far from human habitation, the old fortress of Tepagarh.

The *Continent of Asia* is crossed by a great desert, extending from the Caspian almost to the gates of Peking and the Yellow Sea. To the south of this wilderness lies a region divided into northern and southern parts by the great chain of the Himalaya, and the lofty Nanling mountains, which run from its eastern extremity to the shores of the Pacific, opposite the island of Formosa. To the north of this mountain wall are Thibet and China, separated by the Yungling mountains; to the south of the same barrier are the plains of Hindustan and the valleys of the Indo-Chinese countries, these two geographical areas being separated by the hills of Arracan. Beyond the Trans-Gangetic peninsula there is a third region—the Malay archipelago. Thibet is a vast expanse of plains, hills, and valleys, rising from a table land of 15,000 feet in elevation; as lofty, indeed, as the summit of Mont Blanc. Thrown up, *en masse*, within a very recent geological epoch, by some stupendous volcanic force, we find embedded in its soil the remains of animals which still exist in the tepid plains of India. Surrounded on all sides by vast mountain-bulwarks, its lowest elevation seems to be at its south-eastern corner—at the point, in short, where it joins the Indo-Chinese countries, and whence they expand in long mountain-ranges, which spread out like the ribs of a fan as they approach the Pacific.

MOUNTAINS.

The *Trans-Gangetic peninsula* mountain system may be compared to an out-stretched hand, of which the thumb represents the hills of Arracan, the fore-finger the ridge which terminates in Malacca, the little finger the Nanling chain, running through southern China north of Canton; and the wrist, the depressed edge of the table-land of Thibet, from which its waters are poured down into the Pacific, through valleys corresponding to the openings of the outstretched palm.

The *Malay Islands* lie beyond this region and form a third link in the chain of countries which separate China and India. Thibet is a desert of parched and frozen highlands; the Malay Islands are a tropical wilderness, with a hot and moist climate, in which the very exuberance of vegetable life has prevented the formation of civilized societies or a numerous population; while the intermediate countries in the south resemble the Malay Islands on the extreme north of the Thibetan highlands. From the southern slopes of the Himalaya issues the Ganges river, while from the depressed edge of the Thibetan plateau, the river Brahmapootra descends into the highly cultivated and populous plain of Hindostan, studded with historical cities, such as Benares, Delhi, and Calcutta. From the eastern side of the same neck of land there runs, in the opposite direction, the Yang-tse-Kiang, through a broad alluvial valley, expanding into the plain of China, the richest, the best cultivated, and the most densely-peopled region of the globe. The Yang-tse-Kiang, is navigable, by junks of fifty tons, up to the great bend, where it turns eastward.

Till very recently, the whole traffic between China and England was carried on at Canton, by conveying the produce of the interior over the passes of the Nanling mountains, while the traffic between the same central regions and Russia was conducted at Kiachta, a place equally remote, it being beyond the Insechun mountains and the desert of Shamo.

Khassya Hills. The undulatory eminences of the Khassya country, some 4,000 to 6,000 feet above the level of the sea, are dotted with groups of huge unpolished squared pillars and tabular slabs, supported on three or four rude piers. In one spot, buried in a grove, were found a nearly complete circle of menhir, the tallest of which was 30 feet out of the ground, 6 feet broad, and 2 feet 8 inches thick; and in front of each was a dolmen or cromlech of proportionately gigantic pieces of rock, while the largest slab measured was 32 feet high, 15 feet broad, and 2 feet thick. The

MOUNTAINS

method of removing the blocks is by cutting grooves, along which fires are lighted and into which when heated, cold water is run, which causes the rock to fissure along the grooves; the lever and rope are the only mechanical aids used in transporting and erecting the blocks. The objects of their erection are various—sepulture, marking spots where public events had occurred, &c., the Khasian word for a stone, "man," as commonly occurs in the names of their villages and places as that of man, maen, and men does in those of Brittany, Wales, Cornwall, &c.; thus Mansmai signifies in Khasia the stone of oath, Mamloo, the stone of salt, Manflong, the grassy stone, &c., just as in Wales, Penmaen Mawr signifies the hill of the big stone, and in Brittany, a menhir, is a standing, and a dolmen a tablestone, &c. The resemblance of the burrows and their contents with the cromlechs, &c., to the Druidical remains which are discovered in the ancient seats of the Celtic race in Europe, is too exact and remarkable to be accounted for on any other supposition than that of their derivation from the same origin. Hence the people who introduced Druidical rites into India must have brought them with them from Central Asia, and they must have entered India at a period as early as the introduction of Druidical rites into Europe.

The Ava and Malayan Mountains run parallel to the last, being given off from the snowclad mountains of East Tibet and, though rapidly diminishing in elevation are continued almost to the equator.

a. Upon the right bank of the Irawadi the mountains opposite Than Yun Yova, in lat. N. $24^{\circ} 36\frac{1}{2}'$ long. E. Gr. $96^{\circ} 31\frac{1}{2}'$ have an average height of from 6,000 to 7,000 ft. One of the highest, the summit of which is visible from the valley, reaches apparently 8,000 feet.

b. Westward of Let pan Zin Yova, at a little distance from the right bank (lat. N. $24^{\circ} 27' 2''$ long. E. Gr. $95^{\circ} 56' 15''$), the summits of the mountains attain a height of 2,000 feet.

c. Heights of 800 and even 1,000 feet are also numerous on the right bank of the river, only 20 to 23 miles north of Shue-mut-tho-phya (lat. N. $23^{\circ} 4'$ long. E. Gr. $96^{\circ} 15'$).

The character of the whole river district, including the elevations not above from 3,000 to 4,000 feet presents a thoroughly tropical appearance. The declivities of the hills, as well as the valley of the river, are covered with the wildest and most diversified vegetation, in the shape of dense tree and grass jungle.

MOUNTAINS

The Yomah Mountains, the central chain of Burmah proper, are extended into Pegu and form the spine, as it were, of the province with the valley of the Irrawaddy on the east: and the several minor valleys lying between the off-shoots by which the chain is terminated on the south, as the valley of the Zamayee or Pegu river, the valley of Hlaine or Lino river, together with the intermediate valley of the Phoungee river or Paizoondoung creek, lying between the Hlaine and Pegu rivers. One of the most southern points of the Yomah lies between the Hlaine and Paizoondoung, of which the Padoda hill at Rangoon may be considered the last elevation, marking the direction of the chain or line of local disturbance. The most elevated portion of the Yomah chain appears to be that from whence these southern branches radiate, where the Oakkan and Thounzai Chongngs derive their source, falling into the Hlaine rivers, on the east and south. This part of the chain, Dr. McClelland estimates at about 2000 feet above the sea, on the west, and the Zamayee and Phamgyee rivers presenting steep, and inaccessible declivities.

Malay Peninsula. The chain which extends along the Malay Peninsula is most conspicuous and is continued at intervals to Banca and Billiton, and perhaps may be traced as far as the north coast of Java. This range abounds in metals, or, at all events, in its mining operations are pursued with great success, probably from the strata, owing to its central position, having been little disturbed by the convulsions which have shaken the countries on either hand. The productiveness of the gold mines of the Malay Peninsula and of the tin mines of Banca is well known. This range may be considered as the back bone of the Great Asiatic Bank which extends into the Archipelago from the south-eastern extreme of Asia to a distance of nearly 1,000 miles, in fact to within 50 miles of Celebes, perhaps to the south-west extremity of the Island also, but there is a space of nearly 30 miles across which no soundings have been carried. Sumatra, which lies on its western verge, has been subjected to volcanic action, but not to so great an extent as to disturb the direction of its mountain range, which runs parallel to that of the Malay Peninsula. The third and last range that can be traced into the Indian Archipelago is the one that traverses Laos and Camboja, at the southern extremity of which it disappears for a time, showing itself only at Palo Condor and Natuna, until it emerges under the north-west extreme of Borneo, and is continued along the entire

MOUNTAINS

west coast of that island. Here it again disappears, and only shows itself again on the north coast of Java, where it ceases entirely: the remaining portion of this island, with perhaps a part of the north-east extremity, being either of volcanic formation or of alluvial deposit. It is rather singular that the celebrated teak-tree, which abounds on the Cambodian part of this range, but is not found in Borneo, is again met with here, the projecting part of the north side of Java, between Samarang and Srahaya, being a vast teak forest, from the timber of which the greater portion of the shipping employed in the Archipelago is constructed. Java is the only island in the eastern seas in which the teak-tree is indigenous, nor will it thrive in the volcanic parts of the island where its cultivation has been attempted. This, which may be called the Cambodian range, is also rich in minerals, especially the Bornean part of it, where large quantities of gold and many diamonds are obtained by the miners. The volcanic islands of the Archipelago also contain metals, gold-dust being found at the bottoms of many of the mountain streams, but it does not exist in veins, as in the Malayan Peninsula and the west coast of Borneo, these having apparently been broken up by the violent convulsions to which these Islands have been subjected.

Burmah and Tenasserim, the Tenasserim Provinces extend for about six degrees of latitude along the east shores of the Bay of Bengal. In breadth they seldom exceed more than one degree of longitude, but their mountains are of considerable height. From Siam, on the east, these provinces are separated by an interrupted range of mountains, occasionally rising to 7,000 or 8,000 feet high, but their general height to the north is about 4,000, diminishing in passing southwards to 3,000 feet or less. The main direction of this range is north and south: this being also the general direction of the coast line, of the minor and outlying ranges of hills, and, therefore, of the rivers. The geological structure is tolerably simple, although at first sight apparently complicated from the great disturbances to which the rocks have been subjected. The central range is of granite, occasionally, but not infrequently of a syenitic character; itself traversed by thick veins of large crystalline feldspathic granite, and often along its outer edges, or near its junction, with overlying slates, characterized by the presence of tin-stone as an ingredient of the mass disseminated among the other mineral constituents. This granite axis is succeeded by highly metamorphic rocks of a gneissose and micace-

MOUNTAINS

ous character, themselves cut up by numerous veins of granite, which, however, do not extend far from the junction. Upon these is a great accumulation of bluish and bluish-black earthy beds, thinly laminated, of thin bedded grits, and of pseudo-porphyrific rock, the normal character of which is a hard earthy rock with small irregularly disseminated subcrystalline felspar, passing, on the one hand, into slates, and, on the other, into grits, often coarse and conglomeratic. These harder rocks form all the higher grounds of the outer ranges of hills. This series being best seen in the southern provinces of Mergui has been previously called the "Mergui" series. The total thickness is about 9,000 feet. It is succeeded unconformably by hard sandstones in thick and massive beds, with their earthy partings, generally of reddish tint, occasionally deep red and yellowish. A few beds are slightly calcareous, and in the upper portion a few thin and irregular bands of earthy blue limestone occur. Above these rest about 200 feet of soft sandstone in thin beds, upon which apparently rests the massive limestone of the country so largely seen near to Moulmein. The thickness of the entire group is about 6,000 feet, and as some of its members are best seen in the northern province of Moulmein, it has provisionally been called the "Moulmein" series. To determine the age of the older of these two groups (the Mergui) there are no data. The aspect of much of the rocks is very similar to the trappean ashes and felstones so abundant in the Silurian rocks of Great Britain, while others are lithologically like Devonian; but these resemblances are very deceptive. The age of the Moulmein series is, however, tolerably defined by its organic contents. These appear to fix the age of the group as distinctly carboniferous. The whole of these rocks were, subsequently to their induration and disturbance, widely and greatly denuded, and on their upturned edges at intervals is found a series of conglomerates and sandstone and imperfectly coherent shales, with thick beds of coal, generally of lignitic character. None of the conglomerates are coarse; the sandstones are fine, gritty, and pebbly, or clean white quartzose grits; the shales thinly laminated; the coal itself thinly disposed in thin flaky laminae, with earthy streakings marking its structure. In addition to the total unconformity of these rocks, the imbedded organic remains are quite distinct. They consist of dicotyledonous plants (leaves) belonging to the group of the Lauraceae, and probably to the genus *Laurophyllum* of Copbert. In the thin

MOUNTAINS.

paperly shales which overlie the coal are also remains of fish (scales, &c.) of a fresh-water character; the whole referring the beds to a very recent epoch, probably corresponding in part to the pliocene of European geologists. It is curious to notice here the absence of any coal in the carboniferous rocks below, and its abundant presence in those newer beds. The total thickness of these beds does not exceed 900 to 1,000 ft. They are never continuously traceable; they occur heaped up against and separated by the projecting ridges of the higher grounds, and must have been deposited when the physical conformation of the country was very similar to that now existing. They appear to be the result of a series of fresh-water deposits, formed in small lake-like expansions along the lines of the great drainage valleys of the country, and to mark a line of general and greater depression between the main ridge of hills dividing Siam from the British dominions, and the outer ridges which occur between this and the sea. The direction of the main drainage of the country is determined by the direction of these ranges, and is discharged into the sea through narrow rocky gorges, which have a direction nearly east and west, and which are due to lines of breakage and dislocation. To this is due the sudden alteration in the direction of the courses of the larger rivers, as may be seen on maps.

Rocks similar to those situated in the Tenasserim provinces extend northwards up the course of the Salween River, and into the adjoining districts of Burmah, to the north-east of Pegu. And, also, close to the capital of Burmah, and stretching nearly north and south, as far as examined, high ridges of metamorphic rocks are again met with, consisting of gneiss, micaceous schists, and highly crystalline limestones, occasionally of a fine white colour, and largely used by the Burmese for sculpture. But the great valley of the Irawady is, throughout a very large extent of its course, bounded on either side by a thick series of rocks, chiefly sandstones but with massive limestones also, which are locally rich in fossils, and which from their evidence, may be clearly referred to the Eocene period. These stretch on both sides of the river as far north as Pughn, beyond which the higher grounds recede from the river banks; but they are in all probability continued thence into Manipoor, and so united with the nummulitic rocks of the Khasia and Cachar-Hills. These rocks have been considerably disturbed and broken, but have a general and prevailing strike nearly north and south, which strike, throughout many

MOUNTAINS.

miles, has determined the general course of the river Irawady. Their thickness is considerable, certainly exceeding 8,000 feet. Above these Eocene rocks, and resting upon them with slight unconformity, is a series of beds of no very great thickness, characterized by an abundance of gypsum disseminated in thin layers and veins, and in the lower beds of which occur the deposit of clays and of vegetable matter, from which are derived the large supplies of petroleum. These rocks are well seen at Senan kyoung ("stream of fetid water"), and are traceable northwards to near Amarapura. In the beds which appear to form the uppermost part of this group, but which may possibly belong to another and distinct series, are found some of the fossil bones of the larger animals which occur abundantly in this district. About forty miles north of Amarapura we again meet with sandstones, shales, and coal, resting unconformably on the metamorphic rocks, and characterized by remains of dicotyledonous trees similar to, if not identical with, those found in the coal-yielding group of the Tenasserim provinces, and which are therefore referred to the same age (pliocene). This series, so far as examined, proved of no great extent or thickness. Of fossils found in Burmah by Mr. Oldham, during his companionship with the Embassy, he notes the following:—

Elephant, tusk and lower jaw, Specimens.	3
Mastodon, lower jaw, and molar tooth, .	3

Crocodile, "	24
Tortoise, "	31
" large, "	17
Undistinguished, "	16

Climatic aspect. The weather side of all such mountains as the Andes and is the wet side, and the lee side the dry in inter-tropical India, each side of the mountain is made alternately the wet and the dry side, by a change in the prevailing direction of the wind. India is in one of the monsoon regions. From October to April the north-east trades prevail; they evaporate from the Bay of Bengal water enough to feed with rains, during this season, the western shores of this bay and the Ghauts range of mountains. This range holds the relation to these winds

MOUNTAINS.

that the Andes of Peru holds to the south-east trades, it first cools and then relieves them of their moisture, and they tumble down on the western slopes of the Ghauts, Peruvian like, cool, rainless, and dry; wherefore that narrow strip of country between the Ghauts and the Arabian Sea would, like that in Peru between the Andes and the Pacific, remain without rain for ever, were it not for the S. W. monsoon, which prevails in India and not in Peru.

After the north-east trades have blown to the end of their season, which in India ends in April, the great arid plains of Central Asia, of Tartary, Thibet, and Mongolia, become heated up; they rarefy the air of the north-east trades, and cause it to ascend. This rarefaction and ascent, by their demand for an indraught, are felt by the air which the south-east trade winds bring to the equatorial Doldrums of the Indian Ocean: it rushes over it into the northern hemisphere to supply the upward draught from the heated plains as the south-west monsoons. The forces of diurnal rotation assist to give these winds their westing. Thus the south-east trades, in certain parts of the Indian Ocean, are converted, during the summer and early autumn, into south-west monsoons. These then come from the Indian Ocean and Sea of Arabia loaded with moisture, and, striking with it perpendicularly upon the Ghauts, precipitate upon that narrow strip of land between this range and the Arabian Sea an amount of water that is truly astonishing. Here, then, are not only the conditions for causing more rain, now on the west, now on the east side of this mountain range, but the conditions also for the most copious precipitation. The fall of rain on the western slopes of the Ghauts sometimes reaches the enormous depth of twelve or fifteen inches in one day.

These winds of India then continue their course to the Himalaya range as dry winds. In crossing this range, they are subjected to a lower temperature than that to which they were exposed in crossing the Ghauts. Here they drop more of their moisture in the shape of snow and rain, and then pass over into the thirsty lands beyond with scarcely enough vapour in them to make even a cloud. Thence they ascend into the upper air, there to become counter currents in the general system of atmospherical circulation.

Animal Life. The elevated towns and villages in Mysore are in great numbers at a height of 2,000 or 3,000 feet. (Bangalur 2,949 feet, Seringapatam 2,558

MOUNTAINS.

feet). The Dekhan follows next in order of elevation (Satara 2,352 feet, Aurangabad 1,855 feet). In Malwa, Berar, and Bahar, none of the larger places reach the height of 2,400 feet. Seoni 2,139 feet, Sagur 1,880 feet, while the principal stations of the Panjab are lower still (Ranipindi 1,737 feet, Peshawar 1,280 feet). The Himalaya rises, in general, so abruptly above the plains, and the latter, particularly in the western regions, are in themselves of such an elevation, that even in the lower parts of the villages, there are but few, if any, points of less altitude, than 1,000 feet above the level of the sea. In the Himalaya, the number of places inhabited by the natives is comparatively insignificant; while the population reaches its maximum in the rich belt of life rising from 3,000 to 8,000 feet, the traces of man and his dwelling place beginning rapidly to disappear at 11,000 feet and even before.

In some provinces of the Himalaya, especially in Nepal, Kamaon, and Garhwal, many villages are deserted in winter, though, as far as regards their elevation, and the solid construction of the houses, they might very well be inhabited throughout the year. The natives, however, prefer removing to villages less elevated, where they spend the colder months. Chalets (Alpenhütten) are as little used in the Himalaya, as tents in the Alps. The pasture grounds, "Karik," for sheep and bovine cattle, are, for the most part, in low elevations, and at no great distance from the village. In the frontier country bordering Tibet, herds of sheep and goats are used for the transport of merchandize. They are driven over the passes to Tibet, laden with grain (a full grown sheep carrying about seven pounds), and return at the end of the summer with salt and borax.

Of the sanitariums in the Himalaya, Simla is 7,156 feet, Darjiling 6,905 feet, Mussoori 6,819 feet, &c. They are at present confined to the outer ranges, at a distance of 40 or 50 miles from the foot of the mountains. Though the interior of the Himalaya would afford, perhaps, many spots more desirable in point of coolness and dryness, the want of roads has hitherto rendered all approaches exceedingly difficult, and to an invalid even dangerous. Chini, a most salubrious place in Kazawur (9,096 feet), has been connected with Simla by a road executed by order of Lord Dalhousie. Also Srinaggar, the capital of the valley of Kashmir (5,146 ft.), has of late become easy of access from several parts of the Panjab. In the summer of 1861 there were in Kashmir about three

MOUNTAINS.

hundred visitors, including ladies and children.

Of wild animals, tigers ascend to 11,000 ft. in the Himalaya; they are not, however, seen in Western Tibet, or the Kuenloen. Leopards may be met with in the Himalaya and in Western Tibet even at 18,000 or 14,000 ft.; on the Kidarkanta (12,480 ft.) The domestic cat is common in Tibet. Dogs are the companions of the Tibet shepherds, whom they follow over passes exceeding 18,000 ft., without apparently any particular difficulty. A greater variety of wild species also exist in different parts of High Asia.

Jackals are found in the Karakorum between 16,000 and 17,000 ft. Hodgson mentions two species of foxes in Eastern Tibet. Wolves are not known to frequent the Himalaya proper, but they are found in Western Tibet, and close to the Karakorum pass (18,845 ft.)

The wild yak, the existence of which in the wild state, has been doubted, and the kiang, five to six species of wild sheep and goats; hares and mice are as found high as 16,000 to 17,000. In the Himalaya, the number of species of snakes and frogs rapidly decrease with height, but lizards remain nearly the same between 1,000 to 15,000 ft.

Butterflies, are found in the Himalaya to 13,000 ft., in Western Tibet and Turkistan even 16,000 ft., as localities of permanent habitation. Beetles probably follow the highest formation of grassy turf in the Himalaya, as well as in the Alps. The upper limit of mosquitoes is at about 8,500 ft., and the peepst make themselves very troublesome in the Eastern Himalaya during the rainy season as high as 13,000 ft. As in the Alps, the new fields of the glaciers are often covered with the remains of insects carried up by the ascending current to 18,000 and even 19,000 ft. Domestic animals, such as sheep, goats, tame yaks, horses, and dogs, follow man across the highest passes between Turkistan and Tibet, the two-humped Bactrian camel even being used as a beast of burden. When without a load, no difficulty is experienced in bringing these camels even over the steeper passes of the Himalaya. The existence of infusoria, seems a little subject to limitation by height in the Himalaya, or the other chains of High Asia, as in the Alps. In a few small fragments, which were chipped off from the rocks on the Ibi Gamin pass (20,459 ft.), Prof. Ehrenberg detected their presence, and even found them not insignificant in quantity; he dis-

covered two species of infusoria, some of which he sent to Dr. Ehrenberg for identification, and others to Dr. Ehrenberg for identification, and others to Dr. Ehrenberg for identification.

Vegetation. The extent to which the plants of Europe abound in India has only lately been known, but 222 British species have been ascertained to extend into India, and a multitude of mountain plants, many of them the most conspicuous in Europe, range from the coast of the Levant and the Black Sea to the Himalaya. This is the more remarkable as the Himalaya range is, in idea, rather than really, connected with the mountains south of the Caspian, or with the Caucasian Alps, or those of Asia Minor, for the mountain mass of Asia sinks to the westward of Afghanistan, rising again only in isolated peaks. The *Corylus colurna* (C. lacera, Wall.) ranges from the Levant and the Black Sea to the Himalaya. *Quercus ilex*, *Ulmus campestris*, *Celtis australis* and *C. orientalis*, extend from Spain to the N. W. Himalaya, and the walnut, ivy, juniper, and yew extend from Europe through the Himalaya across China, through Mexico, and throughout N. America. The yew, the juniper, *Aquilegia vulgaris*, *Caltha palustris*, &c. are common to most parts of Europe, Mediterranean, Northern Asia, the Himalaya, and N. America.

The *Celtis*, *Quercus ilex*, *Olca europea*, *Myrtus communis*, &c., of the Mediterranean, are also Himalayan plants. The European plants, however, rapidly disappear to the east of Kumaon, but there is a blending of the European flora on the east of the Himalayan chain, as to the eastwards there is a mixture of Chinese and Malayan forms with that of the Himalaya. Pines, oaks, and other forest trees of Europe and Asia, rhododendrons, and many other magnificent shrubs, abound throughout the Himalayan chain, often on a gigantic scale.

Trees grow very generally in the Himalaya up to heights of 11,800 feet, and in most parts there are extensive forests covering the sides of the mountains at but a little distance below this limit. In western Tibet, however, there is nothing at all corresponding to a forest. Apricot trees, willows, and poplars, are frequently cultivated on a large scale; poplars, indeed, are found at Mang-nang in Guari Khorsum, at a height of 13,457 feet, but they are the objects of the greatest care and attention to the lamas. On the northern side of the Kung-Lien, are

MOUNTAINS.

no trees at all; owing to the considerable height of the valleys. In the Andes, they end at about 12,130 feet, in the Alps, on an average, at 6,400 feet, isolated specimens occurring above 7,000 feet. The cultivation of grain coincides in most cases with the highest permanently inhabited villages; but the extremes of cultivated grain remain below the limit of permanent habitation. In the Himalaya, cultivation of grain does not exceed 11,800 feet, in Tibet 14,700 feet, and in the Kuen-Luen 9,700 feet. For the Andes, the limit is 11,800 feet, in the Alps, some of the extremes are found near Fiedelen at a height of 6,630 feet, but the mean is about 5,000 feet. The upper mean limit of grass vegetation in the Himalaya is at 15,400 feet; in western Tibet, nearly the same level as for the highest pasture grounds, 16,500 feet, may be adopted; in the Kuen-Luen, grass is not found above 14,800 feet. Shrubs grow in the Himalaya up to 15,200 feet, in western Tibet as high as 17,000 feet, and in one instance, at the Gunshankar, even to 17,313 feet. On the plateaux to the north of the Kara Korum, shrubs are found at 16,900 feet, and, which is more remarkable, they occasionally grow there in considerable quantities on spots entirely destitute of grass. As an example, may be mentioned amongst several others, the Vohab Chalgane plateau (16,419 feet) and Basmalgun (14,297 feet). In the Kuen-Luen, the upper limit of shrubs does not exceed 12,700 feet. Above this height grass is still plentiful, and shrubs being here, as generally everywhere else, confined to a limit below the vegetation of grass, the range presents an essential contrast in this respect to the characteristic aspect of the Kara Korum. The number of species of plants, as well as the number of individuals, is exceedingly limited in the higher parts of the Kuen-Luen. Lichens are completely wanting in the dry angular gravel covering the high plateau, and the slopes of the mountains in their neighbourhood. Two systems of cleavage are particularly regular in the central parts of the Kuen-Luen; the steeper one dips north 30 to 50° east, the other south 29 to 40° west. A hard crystalline rock occurs, not unlike pudding-stone, which contains geodes of spherical and angular forms, the quarries where the yashm stone is dug are at Gulbagashen, in the valley of Kara-kash.

In the regions at the base of the mountains in the perennially humid provinces of India, from the atmosphere being more loaded with moisture, the climate is more equal-

MOUNTAINS.

ble than that of the adjacent plains, and a warm temperate flora, unknown to the plains, commences at elevations of 2,000 to 3,000 ft, and prevails over the purely tropical vegetation which appears amongst it in scattered types and shrubs. Amongst other orders may be mentioned Magnoliaceæ, Ternstroemiaceæ, sub-tropical Rosaceæ such as *Prunus*, *Photinia*, &c., *Kadsura*, *Spharostema*, *Rhododendron*, *Vaccinium*, *Ilex*, *Strax*, *Symplocos*, *Olea*, *Sapotaceæ*, *Lauraceæ*, *Podocarpus*, *Pinus longifolia*, with many mountain forms of truly tropical families, as palms, *Pandanus*, *Musa*, *Cuscutaceæ*, *Vinæ*, *Vernonia* and hosts of others.

In the Himalaya, the truly temperate vegetation supercedes the subtropical above 4,600 feet; and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, longitude, humidity, and many local circumstances. In Ceylon and the Madras peninsula, whose mountains attain 9,000 feet, and where considerable tracts are elevated above 6,000 to 8,000 feet, snow has never been known to fall. On the Khassya mountain which attains 7,000 feet, and where a great extent of surface is above 5,000 feet, snow seems to be unknown. In Sikkim, snow annually falls at about 6,000 feet elevation; in Nepal, at 5,000 feet, in Kumaon and Gurhwal at 4,000, and in the extreme West Himalaya lower still. In the mountains of Ceylon, on the Neilgherries, and on the Khassya hills, the temperate forms of plants are more numerous than upon the Himalaya. Violent winds sweep over the broad grassy undulating tops of the Khassya hills, and hundreds of species common to the Sikkim Himalaya and to the Khassya, ascend higher in the warm forest-clad and sheltered Himalayan valleys at 5,700 feet in Sikkim than they do in the Khassya hills. In the Himalaya, the genera *Rhododendron*, *Monotropa*, *Pedicularis*, *Corydalis*, *Nepeta*, *Carex*, *Spirea*, *Primula*, *Cerasus*, *Lonicera*, *Viburnum* and *Saussurea*, attain their maximum of development over all other parts of the world. *Ephedra* ranges from the plains of the Punjab up to 16,000 feet in the N. W. Himalaya: the genus *Marlea* ascends from 3,000 to 8,000 feet in Sikkim, and in the Western Punjab, at scarce 4,000 feet, accompanies *Celtis* and a species of ash: subtropical *Myrsine* extends into Afghanistan. *Juniperus excelsa*, found as low as 5,000 feet in Afghanistan, ascends to 15,000 feet in Tibet. *Populus Euphratica*, a *Cyranchum*, *Chloris barbata*, *Cyperus aris-*

MOUNTAINS.

tatus, are tropical and subtropical plants which ascend to 11,000 feet in Ladak, and *Peganum harmala* attains to 9,000 feet. The alpine or arctic flora, on the alpine region of the Himalaya, commences above the limit of trees throughout a great part of the Himalaya, and hardly reaches its extreme limit at 18,500 feet ($3\frac{1}{2}$ miles) of elevation. It has a comparative paucity of cryptogamic plants, is poor in the luxuriant mosses of tall growth and succulent habit, and though fully representing the flora of the polar regions, it partakes in its characteristic genera of the temperate flora, and contains so many types foreign to the flora of the polar regions (as *Gentiana*, *Ephedra*, *Valerianea*, *Corydalis*) and some which are even rare in Siberia, that it must rather be considered as a continuation of the alpine flora of Europe than a representation of that of the Arctic zone.

The Chinese type is abundant in the temperate regions of the Himalaya, is fully developed in the Khasya, Sikkim and Butan, and extends westward to Gurhwal and Kumaon. Chinese and Japanese species of *Aucuba*, *Helvingia*, *Stachyurus*, *Eukianthus*, *Abelia*, *Skimnia*, *Bucklandia*, *Adamia*, *Benthania*, *Corylopsis*, and of those common to India and China are *Microptelea parvifolia*, a species of elm, *Hamamelis Chinensis*, *Nymphæa pygmaea* and *Vaccinium bracteatum*, all of the Khasya, *Quercus serrata* of China, Nepal, Sikkim, and the Khasya, while species of *Illicium* occur in the Khasya, Thea in Assam, and *Magnolia* in Sikkim and Khasya, with species of *Camellia*, *Deutzia*, *Hydrangea*, *Viburnum*, several *Cornææ* and *Houthuyneæ*, *Schizandrea* are peculiarly characteristic of the Chinese flora, but also extend into Java. *Lardizabala* belong to the Himalaya, Japan and China. The fern *Bowringia* is found in Hong-Kong and in the Khasya, and the genera *Daphne*, *Bluekandia*, *Eukianthus*, *Heisterlowia*, *Scepa*, *Antidesma*, *Benthania*, *Goughia*, *Myrica* and others, are both Chinese and Indian. *Euryale ferox* is abundant in China, in the delta of the Ganges and in Kashmir, and *Nepenthes phyllanthiflora* is a native of the Khasya, of Macao, and of the Louisiade Archipelago.

The Siberian type of plants is very fully represented in the upper and alpine regions of the Himalaya, and is most confined to the drier parts of the chain, but may be observed even in the most humid regions of the Himalaya, and occasionally on the mountains of tropical India. It approaches in many respects to the south European vegetation, but is characterized by the predominance of *Fumariaceæ*, *Potentillæ*, *Leguminosæ*, of

MOUNTAIN LIMESTONE.

Umbelliferae, *Lonicera*, *Artemisia*, *Pedicularis* and *Boraginæ* and by the rarity or total absence of the European *Cistaceæ*, *Rosa*, *Rubus*, *Trifolium*, *Erica*, *Ferns*, and other cryptogams. *Artemisia* and *Astragalus* of the Siberian type are abundant throughout Tibet and the interior Himalaya, and are represented by a few species in the plains of the Panjab and on the Khasya mountains. *Spiræa khamshatica*, *chamædrifolia* and *sorbifolia*, and *Paris polyphylla* are alike Siberian and Himalayan forms, while *Corydalis sibirica* and *Nymphæa pumila* are identical in Siberia and on the Khasya.

Many species of tropical plants of the Neilgherry and Khasya hills, of Ceylon, and of the Himalaya, are identical with Javanese mountain plants. *Gaultheria nummularia* is found in the N. W. Himalaya through the whole range into the Khasya, and also on the Javanese mountains 3,000 miles distant. The *Sedgwickia cerasifolia* of Griffith (*Liquidambar altingia* of Blume), also the curious *Cardiopteris lobata*, several oaks and chestnuts, *Antidesma*, a willow, and *Myrica*, are common to the Khasya and Java, and *Marlea* is spread into China, throughout the Himalaya, and to the mountains south of Kashmir. At 4,000 to 5,000 feet elevation in the Khasya, fifty species of Gramineæ and twenty to thirty species of Orchidæ, have been collected in an eight miles walk. The mountains of India, when above 4,000 or 5,000 feet, present a temperate vegetation, which becomes wholly temperate at greater elevations, and passes into an alpine flora over a large extent of still loftier mountain country.—*Sir Wm. Jones's Works*, Vol. I., p. 23. *Malcolm's Central India*, Vol. I., p. 29., *de Schlagentwert, Hypsometry of India. Report on the Proceedings of the Magnetic Survey of India*, p. 9. *Elphinstone History of India*, p. 11. See *Arians*, *Karakorans*, *Yak*.

MOUNTAIN EBONY. *Bauhinia variegata* Linn. also *B. acuminata* Linn.

MOUNTAIN GLOBE FLOWER. *Trollius Europeanus*.

MOUNTAIN JACK. *Artocarpus echinata* Roxb.

MOUNTAIN LIMESTONE, so called, underlies the whole of the Kymore range in Shahabad, and it also shows itself along the valley of the Soane as far at least as Mungeysur peak in Mirzapore. In some parts as in Rohtas, it crops up boldly to 200 or 300 feet, forming a sloping base to the precipitous sandstone rock. In these places

MOUNTAIN LIMESTONE.

there appear to be three well defined strata, viz., an upper one of a yellowish blue mixed with disintegrated sandstone, iron-pyrites, and chalk, all in their places. Below that a more bluish grey limestone with occasional calcspar crystals again is found, but generally of the same nature as a German lithographic stone. Under the aforesaid strata lies a very dense bluish-grey limestone mixed with veins of calcspar. It is not used by native lime burners, as being intractable. This is the lowest stratum, and would be an almost indestructible building or flooring stone from its great hardness, much harder than granite, and approaching to porphyry. It may be had in large blocks, and, if sawn into slabs, would be a very handsome building stone, bluish grey with white streaks, and moreover it would probably make a superior kind of lime. Immense quantities of lime are made from the quarries of the western bank of the Soane, and exported down the Soane and the Ganges as far as Monghyr. Perhaps 300,000 to 400,000 tons are made annually, and the material is inexhaustible. The same limestone rock crops out on the northern face of the range at intervals, between the Soane river and Mirzapore; and again, especially in the singular and interesting limestone caverns of Goopteeswar in the valley of the Doorgowtee river, at Beetree Band, in Khawah Kohat Mussaye, on the Sooreh river, and near Mirzapore. With canals and tramways these quarries could supply all Northern India with the finest lime in the world. The cost of the lime at these quarries varies from 6 to 16 rupees per 100 maunds, or, say 5 to 14 shillings per ton. The present system of lime burning is a very imperfect one, and indeed only suited to native wants, but with European supervision, although the material could not perhaps be reduced cheaper, it could be produced with much more certainty and evenness in quality. Close to Jubbulpore is a range of low hills within a circumference of about ten miles, interspersed with masses of limestone both above and below the surface. The fuel generally used and most available for burning the lime is brushwood. It is cut and brought from a distance of 7 or 8 miles. The stone is broken into fragments of 6 to 12 inches in size, then piled like a dome over a hole of about 9 feet in diameter dug in the ground, and a passage left for introducing the fuel. This kiln is kept burning continually for the whole of the day, and the lime removed on the following morning. The fuel is used in the proportion of 40 maunds to every 75 maunds of limestone. Twenty-

MOUNT ARGILLOS.

five maunds of the stone yield about 50 maunds of well-burnt lime. The cost of collecting and putting it in the kiln amounts to 3 rupees for every 100 maunds of lime. The fuel costs from 5 to 8 rupees for every 100 maunds of lime. The entire cost of preparing the lime varies from 8 to 10 rupees per 100 maunds. The hills are conveniently situated both as regards the line of railway to Bombay as well as to Mirzapore.—*Cal. Cat. Ez.* 1862.

MOUNTAIN PEPPER. *Capparis sinaica*.

MOUNTAIN SHEEP. *Ovis aries*.

MOUNTAIN SORREL. *Vide Oxynra*.

MOUNTAIN SPINAGE. See Orache.

MOUNT ABOO. The number of peaks which crown this mountain is variously stated. According to Tod, there are six, the most elevated of which is that of Gornknath, having on its summit an area of only ten feet in diameter, and surrounded by a shrine dedicated to Gornknath; each of the other peaks has its shrine. On a small tableland on the mountain, about 600 feet below its summit, is the ancient palace of Khengar and numerous Jain temples. See Aboo.

MOUNT ARAFAT. See Adam.

MOUNT ARARAT, is called Agri dagh; it is in height about 16,200 feet. In the last volume of 'Cosmos,' Humboldt records the height of Demavend at 19,715 feet, which is but 1,785 feet under the height attributed to it. According to Humboldt, Ararat is only 17,112 feet high. General Monteith, who passed three years at the foot of Mount Ararat, used many means to ascertain its elevation, and made it 16,000 feet above the level of the Araxes. This is the Mons Macis of the ancients, the Ararat of modern geographers, in the province of Erivan. At a distance, it has a resemblance to a ship. It is called by the Armenians Mountain of the Ark, and by the Persians Mountain of Noah. Agli-dagh being the name given to it by the Turks; and the Armenians call it Macis. It is called by the Arabs also Jabl-ul-Judi and by the Armenians Massis Sinusar, or Mountain of the Ark. But all unite in revering it as the haven of the great ship which preserved the father of mankind from the waters of the deluge. Berosus and Alexander both declare that in their time it was reported that some planks of the ark remained on this hill, at the date of the accession of the Abbasside caliphs A. D. 749.—*Porter's Travels*, Vol. I., p. 183; *General Monteith's Report*. See Iran.

MOUNT ARGILLOS. Rigyal, Tibetan, mountain king—is the origin of Plutarch's Mount Argillos (De Fluviiis), the name of the mountain on which Bacchus was born. Riga,

MOUNT BAIBHAR.

Tibetan, a mountain, is the same term as mount Righi, in Switzerland. Rigyal is one of the trans-Himalayan range. The peaks of this range are from 20,786 to 21,000 feet in height. Its general direction is from South East to North West, and its extreme length is upwards of 350 miles. It forms the natural boundary of Ladak, Balti, and Rongdo, on the north, and Rukchu, Parik, Dras and Astor on the south. Its passes on the eastern half of the range are from 16,495 to 18,746 feet in height, and on the western half, from 12,000 to 16,000.

MOUNT BAIBHAR.—In the inscription on the Jain temple here, the name is sometimes written Baibara, and sometimes Vyavahara. General Cunningham thinks, it is the Webharo mountain of the Pali annals, on whose side was situated the far-famed Suttapanni Cave, in front of which was held the first buddhist synod, in 543 B. C. This cave, still exists under the name of Son Bhandar, or "Treasury of gold," in the southern face of the mountain; but, following Hwen Thsang's description, it should rather be looked for in the northern face. Ratnagiri is due east, one mile distant from the Son Bhandar Cave. This situation corresponds exactly with Fa-Hian's position of the "Pippal tree Cave," in which Buddha after his meals was accustomed to meditate. It was situated at 5 or 6 li (about one mile) to the east of the cave of the first synod. The hill of Ratnagiri is therefore identical with the Pandao mountain of the Pali annals, in which Buddha dwelt, and which, in the Lalita-Vistara, is always styled the "king of mountains," a paved zigzag road now leads from the eastern side of old Rajagriha to a small jain temple on the top of Ratnagiri, which is frequently visited by jains. He identifies it with the Rishigiri of the Mahabharata. The hot springs of Rajagriha are found on both banks of the Sarasti rivulet, one-half of them at the eastern foot of mount Baibhar, and the other half at the western foot of mount Vipula. The former are named as follows:—1 Gargajumna; 2. Anant Rikhi; 3 Sapt Rikhi; 4, Brakemkund, 5 Kasyapa Rikhi, 6, Byas-kund; and 7, Markand-kund. The hottest of these are the springs of the Sapt Rikhi. The hot springs of mount Vipula are named as follows:—1. Sita-kund; 2 Suraj-kund; 3. Ganes-kund, 4. Chandrama-kund; 5. Ram-kund, and 6, Sringgi Rikhi-kund. The last spring has been appropriated by the mahomedans, by whom it is called Makhdam-kund, after a celebrated saint named Chillah Shah, whose tomb is close to the spring. It is said that Chilla was originally called

MOUNTAIN GOVERDHAN.

Chilwa, and that he was an Ahir. He must therefore have been a converted hindu. To the north east of the old town, at a distance of 15 li, or $2\frac{1}{2}$ miles, Hwen Thsang places the celebrated hill of Gridhra-kuta, or the "Vulture's Peak." According to Fa-Hian, it was 15 li, or $2\frac{1}{2}$ miles to the south-east of the new town. Authorities, therefore, agree in fixing the Vulture's Peak on the lofty hill now called Saila-giri, or the "Rocky mountain;" but General Cunningham could not hear of the existence of any cave in this hill.—*Cunningham*.

MOUNT CARMEL, a small range of hills extends six or eight miles inland, in a S. E. direction from the bay of Acre. Mount Carmel is a termination of the chain of hills commencing at the plain of Esdraelon to the south-east, the extent of which is about eight miles. The Valley of Martyrs and the garden of Elias are near. The Valley of Martyrs is a very narrow dell open to the sea. Carmel has scarcely a tree of any size upon it but is thickly studded with shrubs. The convent of St. Bertoldo stood near the head of the valley. The holy fountain of Elijah is close. The cistern seems to have been hewn in the rock, and is about six feet deep full of clear delicious water.—*Skinner's Overland Journey, Vol. I, p. 101, Robinson's Travels Palestine and Syria Vol. I, p. 169.*

MOUNT DILLI, a hill on the Malabar Coast, 6 miles from the Balliapatam river, a conspicuous headland, visible 24 to 27 miles at sea. The small fort on its outer extreme headland is in lat. $2^{\circ} 2'$ N. long. $75^{\circ} 11'$ E.

MOUNT EVEREST. A mountain upwards of 29,000 feet in height, lies to the west of Kinchinjinga, and is the highest mountain of the world at present known. According to the brothers Schlagentweit, the Nepanese call it Gaurisankar, but the Tibetans to the north call it Chingopanmari.

MOUNT FORMOSA, in lat. $1^{\circ} 49'$ N. long. $102^{\circ} 55'$ E. 40 miles east from Malacca, is the highest summit of a group of undulating mountains near the sea.

MOUNTAIN GOVERDHAN, the hindoo Parnassus is famed in the legends relating to the hindoo god Krishna. At the age of seven, the legends relate, that he uplifted on the tip of his little finger, the mountain Goverdhan, to shelter the Gopa and Gopi from the wrath of Indra, the Jupiter Pluvius of the hindoo Pantheon, who, enraged with jealousy at the diminution of his votaries and sacrifices, consequent on the adoration of Krishna, attempted to destroy them by a partial deluge. This story is re-

MOUNT KAILAS.

presented in the *Matsya Purana*, whence Sir W. Jones has thus poetically introduced it in his hymn to Indra. The bard

—"smil'd, and warbling in a softer mode,
Sang the red lightning, hail, and whelming rain,
O'er Gokul green, and Vraja's nymph-low'd plain,
By Indra hurl'd, whose altars ne'er had glow'd
Since infant Krishna rul'd the rustic train
Now thrill'd with terror. Then, the heavenly child
Call'd, and with looks ambrosial smil'd:
Then, with one finger rear'd the vast Goverd'han,
Beneath whose rocky burden,
On pastures dry, maids and herdsmen trod:
The Lord of thunder felt a mightier god."

In pictures of this miracle, Krishna is always represented as a man, attended by his favorite mistress Radha, and sometimes by a multitude of shepherds and shepherdesses; the former with poles, steadying the uplifted sheltering mountain, a shower of rain and fire falling vainly on its summit. The legend seems to mean that Krishna had departed from the Vedic worship of Indra, from which persecutions arose. Many of the mountains of India are deemed sacred, by the hindoos, jains and buddhists and great numbers of pilgrims visit them annually. John iv. and 20 says, "our fathers worshipped in this mountain," and Hindoost'han abounds with mountainous places, where hindoos worship.

MOUNT HOR, has the grave of Aaron.

MOUNT IMAUS. The Koh-i-Kaf or Mount Kaf of the Persians is the fabulous mountain, which, according to oriental cosmographers, surrounded the world; but, since the science of geography has made some progress in the east, the name has been confined to Mount Imaus to the east, and Mount Atlas to the west. The jan or genii, a race intermediate between angels and men, produced of fire, are supposed to have inhabited the earth for several ages before the birth of Adam, and to have been governed by kings, all of whom were called Soleiman (Solomon). They fell into a general state of depravity and were driven into remote places by Eblis (the fallen angel) and such as remained in the time of Kaiumeras, the first of the Peshadian dynasty of Persia, were by him driven to Mount Kaf.—*Journ. Ind. Arch.*, Vol. V, No. 9, p. 548.

MOUNT KAILAS. Here, according to Hindoo mythology, lies the city of Kuvera, the Indian Pluto. Karachil, a corruption of the Sanskrit Kuvera-chal, is a name of Mount Kailas. This mountain in the mythology of the hindoos is regarded as the habitation of the god Siva, the Olympus of Siva and the Celestials. It is the Kailas range or Gangri range of mountains in the N. W. Himalaya, which extends in one

MOUNT MAHABUN.

unbroken chain from the source of the Indus to the junction of the Shayok and forms the natural boundary between Ladak Balti and Rungdo, on the South, and Rat'-hog Nubra, Shigar and Hanznagar on the North. The Tibetans look upon the Ti-se or the Kailas peak as the highest mountain in the world. The Kailas range has six passes at heights from 15,000 to 18,105 feet. Kailas means crystalline or icy, and is possibly the source of the Latin, French, German, and Danish words for ice and glass; glesum, glace, gler, glas, glass; and is itself a compound term derived from ke water, and las to shine.

MOUNT LEBANON. A mountain in Palestine occupied by the Druse race. The Druses are not confined to Mount Lebanon; but are likewise spread over the Haouran, a country lying to the south-east of Damascus. Zahle, seven hours from Balbec, belongs to the territory of the Druses. Half an hour from Zahle, on the south side of the village of Kerak, is a tomb shown as that of Noah. Jaffa or Yaffa, as it is called by the natives, is the representative of the ancient Joppa, so often alluded to in holy writ. The timber hewn on Mount Lebanon for Solomon's temple was floated to this port (2 Chron. xi. 16). Here the prophet Jonah embarked for Tarshish. (Jon. i. 8). Here also Peter raised Tabitha from the dead (Acts ix. 42), and Simon the tanner resided. In this harbour, Judas Maccabees burnt the Syrian fleet. In modern times, it has acquired a painful celebrity from the twofold acts of inhumanity with which the memory of Bonaparte stands charged, though attempts have been made to attenuate their enormity. The hospital where he is accused of having poisoned his sick soldiers, to prevent their fall into the hands of the Turks is now the Armenian convent. The scene of the massacre of his prisoners is on the beach, about a mile to the south of the town. The tract of country lying between Jaffa and Gaza westward of the mountains of Judea, and distinguished as the plain of the Mediterranean Sea, was the ancient territory of the Philistines, and included the five cities of Gaza, Askelon, Ashdod, Gath, and Ekron. This district still bears the name of Palestine and may be distinguished as Palestine Proper. Following the line of coast to the south; in the interval between Jaffa and El-Arish, the natural frontier of Palestine is on this side.—*Robinson's Travels, Palestine and Syria*, Vol. i. pp. 19, 20. See Lebanon.

MOUNT MAHABUN or the Black mountain, is supposed by some to be the Aornos of the Greeks. It is a mountain in the

MOUNT MERU.

Pir-Panjal or Mid Himalaya and is forty miles up the Indus from Attock. It is at least fifty miles in circuit and from 7,000 to 10,000 feet high. Aornos was fabled in the Greek camp to have thrice defied Heracles himself. See Mahabau Khyber.

MOUNT MERU. A sacred mountain in hindoo legends. The geography of the Vedic hyans confirms the theory that the Arian race migrated from Central Asia about seventeen centuries before Christ, entered India by the North West, dwelt during the earliest Vedic portion in the Punjab, and migrated or fought their way into Central India during the five centuries that succeeded. From the frequent mention of the Sursooty and other rivers, we learn that the Punjab became the locality of the Vedic Arians. The Mussagetæ occupied precisely that position to which the legends of Mount Mern and its rivers (amongst the rivers the Jaxartes and the Oxus may be clearly traced) point as the cradle of the Arian race, and the early mention of the Saccæ (Sakya) and Bactrians (Yavana) as the principle foreign nations, confirms the supposition that the Arian race travelled southwards from the high lands of Central Asia, before entering the Punjab. Aryans in the Vedic age were herdsmen and agriculturists and were dwelling in the Punjab. When they had settled in the fertile valleys of the Ganges and Jumna, they had become brahminists and conquerors, founding kingdoms at Delhi, Ondh, Tirhoot, Bahrur or Biharata, Kosala, Mithila and Magadha, famous in Indian story. In Ceylon is a class of demigods, who, under the name of Yakshyo are supposed to inhabit the waters, and dwell on the sides of Mount Mern, and who are distinguished not only for gentleness and benevolence, but even by a veneration for Buddha, who, in one of his earlier transmigrations, was himself born under the form of a Yakshyo. The malignant spirits of Ceylon are the Yakka, who are the authors of indefinite evil, and the Singhalese have a demon or Samne for each form of disease, who is supposed to be its direct agent and inflictor, and who is accordingly invoked for its removal; and others, who delight in the miseries of mankind, are to be propitiated before the arrival of any event over which their pernicious influence might otherwise prevail. Hence, on every domestic occurrence, as well as every domestic calamity, the services of the Kattadia or devil-priests are to be sought, and their ceremonies performed, generally with observances so barbarous as to be the most

MOUNTAIN ASH.

revolting evidence still extant of the uncivilized habits of the Singhalese. Especially in cases of sickness and danger, the assistance of the devil-dancer is implicitly relied on: an altar, decorated with garlands, is erected within sight of the patient, and on this an animal, frequently a cock, is to be sacrificed for his recovery. Another kind of demon-worship in Ceylon is a debased form of hinduism, where the priest or Kapua is the performer.—*Tremont's Christianity in Ceylon*, p. 232. *Wheeler's History of India*, Vol. i., p. 30. See Aryan, Hindoo, Mern.

MOUNT MYEN-MO. See Myen-mo.

MOUNT NEBO, from the top of this on their return from Egypt, the Israelites first beheld the "land of promise," and there, their illustrious chief breathed his last.—*Robinson's Travels, Palestine and Syria*, Vol. I. p. 62.

MOUNT OF OLIVES, a hill on the east of Jerusalem, its highest summit is 2,400 feet above the level of the sea.

MOUNT OHOD, the burial place of Aaron, is shown over the summit of Mount Hor. See Aaron.

MOUNT OPHIR, in lat. 0° 5' N. long. 100° 0' E. on the west coast of Sumatra, 24 miles inland, appears by itself like an obtuse cone, separated from the chain of other mountains and may be seen from a distance of 110 miles in clear weather. See Malacca Fort.

MOUNT PARNASSUS. See Ophir. Serpent.

MOUNT SINAI. A mountain of Arabia, on the eastern shore of the Gulf of Suez 150 miles south of Suez, famed in the history of the Hebrew nation as the district, whence laws for their guidance was communicated to Moses, their leader. It is surrounded by desert, which the wandering bedouins occupy. At the foot of the mountain is the Greek convent of St. Catherine, founded in 1331 by William Bowldesell, the monks of which are kept almost prisoners by the bedouins. The Arabs call Senai, Jabl-ul-Tur. A stone, called tsaf by the Arabs, is found near Mount Sinai; it is brittle, with the appearance of pipe-clay, and it serves the poor instead of soap, it is also useful in taking stains out of cloth, and in refreshing the skins of asses, being rubbed over them for this purpose in summer time.—*Burkhardt's Travels in Syria*, pp. 394, 488.

MOUNT TABOR, lies to the east of Nazareth.—*Robinson's Travels Palestine and Syria*, Vol. I. p. 211.

MOUNTAIN ASH. Tang-li. Chinese, *Grewia elastica*.

MOW CHOK.

MOUNT ZAGROS, or the 'hot country' is the name given to that tract of country which lies between the Tigris and Mount Zagros. *Rich's residence in Koordistan*, Vol. I. p. 48. See Luristan.

MOUNT VAIKANT'HA, the paradise of Vishnu.

MOUSTACHE. In British India, amongst hindoos and mahomedans, passing the hand over the moustache, is a signal both of defiance and self-gratulation.—*Tut's Rajasthan*, Vol. I. p. 353.

MOUSUL, the name of a city on the western bank of the Tigris. It is six caravan, or four horseman's, hours from Nimrud which Rich supposes is the Larissa of Xenophon. The large village of Nimrud is sometimes called Deraweish.—*Rich's residence in Koordistan*, Vol. II. pp. 129, 130.

MOUREE, BENG. Anise or sweet fennel. *Fœniculum pannon.*

MOURUNG-ELACHI, BENG. Morung cardamom: *Anomum aromaticum*.

MOWAMERIA. See Singpo.

MOWA OIL. Oil of *Bassia latifolia* properly Muhwa.

MOWAZIN, or Muzzan amongst mahomedans a public crier to summon to prayers.

MOW CHOK. CHIN. A species of bamboo. The most beautiful bamboo in the world, says Fortune, and grows about in wild profusion. In the central and eastern provinces of China it is largely cultivated, particularly on the sides of mountains where the soil is rich, and in the vicinity of temples and other monastic buildings. Its stems are straight, smooth, and clean, the joints are small, it grows to the height of from sixty to eighty feet. Twenty or thirty feet of the lower part of its stem are generally free from branches. These are produced on the upper portion of the tree, and then they are so light and feathery that they do not affect the cleanness of the main stem. In addition, therefore, to the highly picturesque effect it produces upon the landscape, it is of great value in the arts, owing to the smoothness and fineness of its structure. It is used in the making of sieves for the manipulation of tea, rolling ta-

MOWE.

bles for the same purpose, baskets of all kinds, ornamental inland works, and for hundreds of other purposes, for which the bamboo found in India is wholly unsuitable. Like all other species of the same tribe, it grows with great rapidity and perfects its growth in a few months. To use a common expression, "one could almost see it growing." Fortune was in the habit of measuring the daily growth in the Chinese woods, and found that a healthy plant generally grows about two feet or two feet and a half in the twenty-four hours, and the greatest rate of growth was during the night. The young shoots just as they peep out of the ground are highly esteemed as food, and are taken to the markets in large quantities. He was in the habit of using them as a vegetable every day during the season, and latterly was as fond of them as the Chinese are themselves. Sometimes he had them split up, boiled, and dished by themselves, at other times they were used in soup, like cabbage; and they formed one of the ingredients of an excellent omelette. About Hong-Kong and Canton, several kinds of the bamboo are very common. There is a yellow variety with beautiful green stripes, painted on its stems, as if done by the hand of a most delicate artist. But like the Indian varieties, they grow in dense bushes, their stems are not remarkable for their straightness, and the large joints and branches which are produced on all parts of the stem, give it a rough surface, and consequently render it unsuitable for fine work. These tropical, jungly-looking bamboos disappear in the more northern latitudes and in their places we have the mowchok, the long-sin-chok, the hoo-chok and one or two others, all with clean stems and feather-branches, suited for the most delicate kinds of work, and all "good for food." These bamboos are well worth the attention of people who inhabit temperate climates, such as the south of France, Italy, and other parts of the south of Europe. No doubt they would be well worth introduction to some parts of Australia, New Zealand, and the southern portions of the United States of America. In the province of Chekiang the maximum summer heat is from 90° to 100° in the shade, but it is only for a few days in the months of July and August so high; in winter the thermometer (Fahr.) is rarely so low as 20. They invariably grow in a rich yellow loam on the slopes of the hills.—*Fortune's Residence in China*, p. 189. *Wanderings in China*.

MOWE. See Marble.

MOZAFERNAGAR.

MOWLA ALI, a name of Ali.

MOWLOOD, *Ar.* Poetry chaunted before the bier of a deceased person when carried out.

MOU-TAN. *CHIN.*

Mau-tan, *CHIN.* | *Paeonia moutan*,
Tree peony,

The mowtan or tree peony, is abundant in China, fruits large, and variegated flowers, it bears the name of hwawang, or king of flowers to indicate the estimation in which it is held. The skill of the Chinese gardeners has made many varieties, but the difficulty of perpetuating them may be one reason for their high price. Tree peonies are brought south-wards in large quantities every year, about the month of January, from the northern provinces. They flower soon after they arrive, and are rapidly bought up by the Chinese to ornament their houses, after which they are thrown away, as they do not thrive well so far south as Canton or Macao, and will not flower a second season. They are sold according to the number of flower-buds they may have upon them, many of them fetching rather high prices. Several very valuable varieties of the Moutan, or tree peony, are to be found in gardens near Shanghai. Those varieties of this flower, which are yearly brought from the northern provinces to Canton, and which are now common in Europe, have blossoms, which are either rose-colored or white; but in some parts of China purple, blue, and yellow varieties are produced, although these were never brought to Canton for sale. Amongst them from Sochoho fifty miles from Shanghai there are lilacs and purples; some nearly black; and one which the Chinese called "the yellow" which, however, was only white with a slight tinge of yellow near the centre of the petals. — *Williams' Middle Kingdom*, p. 285. *Fortune's Wanderings*, p. 135-136.

MOW-TU and *Tau-tang* are tribes whom the Heuma populations describe as living beyond their boundary.

MOZAIC GOLD or *Bronze Powder* is a bisulphuret of tin, formed by heating the peroxide with its weight in sulphur. It is produced in small, soft, shining flakes, of a golden yellow colour. It is much used for ornamental work, particularly paper hangings — *Waterston, Fumellner*.

MOZAMBIQUE. The Indo-African sea, is that portion of the Indian Ocean extending from its N. W. boundary to the Mozambique Channel and including the Persian Gulf, Arabian Sea and Red Sea. It has had much influence on the ethnology of Eastern Africa. The corresponding eastern portion of the Indian Ocean may be termed the Indo-Australian Sea. Important ethnic considerations—relating to the oceanic winds make it necessary to distinguish these two regions from the middle one; this with the districts of the Indus basin, the marginal district of Belachistan, the great longitudinal one formed by the Persian Gulf and the basin of the Euphrates, the southern Arabian district, that of the Red Sea, and the marginal or Trans-Nilotic one of E. Africa, form the next region. Of these basins the Euphrates and the Red Sea are of especial importance, for by them the ancient civilization of the Mediterranean and the Nile spread their influence into the Indian region, while the Euphrates was itself the seat of a great archaic development of intellect and art.

MOZOME ANGAMI, a rude pagan tribe on the hills of Assam, on the eastern frontier of the Mikir and Cachar. See India; *Naga*.

MOZDAK a pretended prophet in the time of Kobad of Persia, who preached the doctrine of a community of women and possessions.

MRIGUENA, or the *Fawn-Eyed*, a Gujaraui princess, who was married to Maun Singh the great Tomara rajah of Gwalior in the

MUAH-PALA.

beginning of the 16th century. The rajah was fond of music, especially of the sankirna rag or mixed modes, of which Mrignena was a great genius. Four specimens of her composition are yet extant, and called after her name, Gujari, Bahul Gajari, Mal Gajari and Mangal Gajari. It was supposed that the hindu musician Tan Sen attracted by her songs went to Gwalior where he is buried.

MRITA-SANJIVINI. Tel. SANS. sanjivini means to restore to life.

MRITYOO. SANS. from mri, death.

MRITYOONJANA. SANS. from mrytyoo, death, and jee to overcome.

MRU or **Taug Mru**, a tribe on the Koladyn river and supposed by Dr. Latham to be the same as the Mrung who allege their origin to be from Tipperah. The number of the Mru in Aracan is about 2,800. At one time a Mru chief was chosen king of Aracan, and the country was Mru when the Rak-heng conqueror invaded the country. The word Mru is supposed also to be the same as Miri. The Mru tribe in Aracan, occupy the hills between Aracan and Chittagong; they seem of the same lineage as the Myamma. The former dwelt on the Koladan river and its feeders; but having been driven out by the Kami now occupy hills on the border between Aracan and Chittagong at the source of the Morce river which disembo-gues in lat. $21^{\circ} 40'$ N. South of Koota-boodea island.—*Dr. Latham's Ethnology.*

MRUNG of Aracan dwell with the Doing-Nuk in the upper basin of the Mayu and also, it is said, amongst the hills on the eastern border of the Chittagong district. They say they are the descendants of captives carried away from Tipperah by the kings of Aracan. Their vocabulary has affinities with the Garo and Bodo. This is a striking confirmation of the history of Aracan which relates to the conquest of the portion of eastern Bengal by the Rakhoing. According to Captain Phayre, Dacca is the northern limit of their possessions, but a deportation of Garos and Bodos, or of a mixed tribe on the confines of the pure Garos, shews that their conquests extended much further in that direction. They are said to be the descendants of a race, whom, several generations back, Aracan kings carried away from Tipperah; but also a colony imported from the Bodo country by the kings of Aracan, at the period when their conquests extended far up eastern Bengal.

MUANG-LUN, A small district tributary to Siam near Ayuthia.

MUAN-THAI. The kingdom of Siam in Thunberg's time, was by the Natives called Muan-Thai, as much as to say, the Land Thai. In their books it is found with this epithet, Krom Thop Pramma has Ikoon, (Circuits visitation is Deorum) the Circuit of the visitations of the gods. The Malaysians and Peguans call it Tziam, from whence comes the European name Siam. Its Northern Latitude about the middle of it, or where the capital city is situated, is fourteen degrees, eighteen minutes and its longitude according to the common maps 138° , but according to the late observations of the Jesuits 120° degrees Eastward it borders upon the kingdoms Ton-kin, Cochin-China and Cambodia; on the south it is limited by the sea, and the countries of Malacca, of which the king of Siam possesses Ligor, Tanasseri, and some other small provinces. On the west was the kingdom of Pegu, and on the north that of Laos. Considering its extent it is but indifferently peopled being left inhabited only along the banks of the rivers.—*Thun. History of Japan, Vol. i. p. 25.*

MUAK. See Jakun.

MUAZZAN the servant of the mahomedan mosque who calls the Azan or summons to prayers. The words of his summons are

i. Allahu Akbar, Allahu-Akbar! God is Great! God is great.

Rowance.	Dil.
Weebance.	Halla.
Lakunoo.	Hapa.
Morance.	Khumance.
Kunderya.	Kana.
	Kao.
	Batach and other castes

The Jharejah have been notorious for killing their infant daughters. They obtain in marriage the daughters of any of the numerous races of Rajputs and even find their facilities such as to allow of their being nice in selecting from the most respectable families. They are furnished with wives by the Jhalla, Wagela, Gail, Churassumma, Purmar, Surney, Soda, Jaitwa Wala and Wadal tribes; but there seems to be a general preference in favour of the Jhalla. From the Jaitwa, the Jharejah cannot have obtained any wives for a long time; as it is more than a century since any grown-up daughters have been seen among them. This fact is to be accounted for only by admitting that female infanticide was prevalent among them. Of this, indeed, there seems no reason to doubt; for, although they allow that the practice is sinful, and do not openly avow it, they, as well as the Jharejah among them signed the instrument of abolition; however, this outrage on human nature is of comparatively recent origin, and may without much hesitation, be ascribed to the example of the Jharejah, in concurrence with base and mercenary motives. "The influence of example and communication," says Colonel Walker, and the remark is of a cheering, as well as of a saddening nature "is capable of procuring converts to the most criminal and

MUCUNA.

flagitious courses."—*Report*, para. 164-169.

MUCUNA, a genus of plants belonging to the order Fabaceæ. The following species are known in the East Indies.

<i>atropurpurea</i> , D. C., Courtallum Konkan, Travancore.
<i>bracteata</i> , D. C., Chittagong.
<i>capitata</i> , W. and A., Cultivated.
<i>gigantea</i> , D. C., Peninsula of India, Sunderbuns.
<i>hirsuta</i> , W. and A., Peninsula of India, Sunderbuns.
<i>imbricata</i> , D. C., Sylhet.
<i>monosperma</i> , D. C., all British India.
<i>novae</i> , Buch., Bengal.
<i>pruriens</i> , Hook., S. E. Asia; Archipelago.
<i>utilis</i> , Wall., Australia, Mauritius.

The species are climbing herbs or shrubs, with pinately-trifoliate leaves and axillary racemes, which hang down when bearing fruit. A product of species of *Mucuna* is the cowage,

Kaunchkuri,	DUK.	Atmagupta,	SANS.
Cowage,	FR.	Kosam billi wail	SINGH.
Kukkratze,	GER.	Puney kali	TAM.

Rawa,	JAV.	Enuga-dola-Gunda,	"

Cowage is probably a corruption of the Arabic, Hindustanee or Bengali names of one of the plants that produce it; it consists of the hairs found upon the pods of different species of *Mucuna*. They are exceedingly slender, brittle, and easily detached, and the fragments readily stick into the skin and produce an intolerable itching; hence they are frequently employed for mischievous purposes. Cowitch is also used medicinally as a vermifuge, by being mixed with syrup till of the consistence of honey, and given in doses of two or three tea-

MUCUNA PRURITA.

spoonful. The species are found in hedges, thickets, on the banks of rivers, and about water-courses, in the East and West Indies, and in America within the tropics. *Mucuna urens* and *M. pruriens* usually furnish the substance; but that from *M. monosperma*, called by the Telinga, Enooga dola Gunda, or Elephant's Scratch-wort, is said to exceed the others in the irritating burning property of its hairs. Dr. Roxburgh states that *M. pruriens* was one of the plants formerly used in India to poison wells but it is less hurtful than was supposed.—*Drs. Rozb. Fl. Ind. Voigt.*

Grows all over British India and in the Moluccas. It has large purple flowers. This when cleared of the small hairs which cover it is eaten by the Natives like other beans. Rhede says that on the Malabar Coast it is supposed to have the effect of exciting venery. The strigose hairs as well as those of *Rottlera tinctoria*, are used in India as an anthelmintic, Sir W. Hooker has distinguished the East India plant, *M. prurita* from *M. pruriens*, which is indigenous in the West Indies. The pods when ripe, are of a brownish colour, and covered with innumerable sharp prickles-like hairs, which penetrate into and irritate the skin. They dispel lumbrici and ascarides by sticking into their bodies, when pressed against the intestines, and thus irritating and dislodging them. The pod being dipped into treacle or honey, have the hairs scraped off until they have the consistency of an electuary

MUDA-MALLAI.

when a table-spoonful may be given to adults, and a ten-spoonful to children, followed by a purgative of castor oil, &c. A cowhage is very common in the Karen jungles. In the Punjab the seeds are principally used in special diseases and given with milk. The hairs of the pods are not used as anthelmintics in India, as they are in England for round worm. They have been applied externally for paralysis and produce much itching. The seed is said to absorb the poison of scorpions and to remain on a bite till all is removed.—*Rozb. Fl. India. Voigt. Powell's Hand-book, Vol. I. p. 341. Royle. Mason. O'Shaughnessy, Ainslie, p. 244.*

MUCUNA URENS. See Cowhage.

MUCUNA VENENOSA, is the name given to the plant producing the poison ordeal bean of Old Calabar. *Mucuna Balfouriana* of Old Calabar, resembles a *Tranquebar* species.

MUCUNDA. During the life time of the emperor Akbar many hindoos believed him to have been a hindoo in a former birth, that he enclosed in his body the soul of a devout brahmin, who had in a past ago borne the name of Macunda, and had taken a fancy to become the emperor of India. In nine months after his death, Macunda was permitted to generate in the womb of sultana Hamida Bann, and to take his birth at Amercote in the character of Akbar. Indeed there were some grounds for the hindoos to claim Akbar as a prince of their race, that emperor had a hindoo wife, the princess Jodh Bai, had a hindoo daughter-in-law, the Marwarce wife of Jehangir, had a hindu general, the raja Man Sing, had a hindu financier, the rajah Soder Mull, had a hindu favourite the rajah Beerbal, had a hindu songster, Tansen, had many hindoo officers and hindoo pandits always about him, much in his court favoured of the hindoo, and he had in a manner hindooized himself by his ardent devotedness to the cause of hindoo welfare.—*Tr. of Hind. and other works were supplied with timber from these forests.—*Conservator's Report.*

MUDAN. See Mudani.

MU-DAING, BURM. *Cycas circinalis*, Linn.

MUDANI, a mahomedan sect, founded by Mudan, a sufi. They admit the divine mission of Mahomed, but disclaim his title to particular veneration. The Mudani go nearly naked, braiding the hair and smearing the body with ashes, and wearing iron chains round their waists and necks.

MUDAR, also Ak. HIND. Are names applied to the *Calotropis gigantea*, the gigantic, swallow-wort, a plant which is widely diffused throughout the southern provinces of the peninsula of India where it grows wild, preferring poor soil near the sea. It is replaced in the Bellary District, by *C. procera*, which is equally common and in Northern India by *C. Hamiltonii*. To obtain the fibre the branches are gathered and dried in the sun from twenty-four to thirty-six hours, when they are taken up, the bark peeled from the woody parts, and the fibres gathered. If placed out in the dew for a night, they lose their greenish tint, and become white. The sap of the Mudar plant is applied externally as a rubefacient; dried, it is mixed with croutchoue.

MUDDA KHARJURAPU CHETTU. TEL. *Phoenix dactylifera*, L. Mudda "a mass, a lump."

MUDAREEA, or Subqateea, a class of faqueers.

MUDARI. CAN. Antelope Arabica.—*Hemiprich*.

MUD BAY or Muddy Bay, is the commercial port of Alleppey in the kingdom of Travancore, 36 miles south of Cochin, remarkable for the singular natural break-water formed in the open sea, consisting of a long and wide bank of mud, the effect of which is so completely to break the waves, that ships of all sizes can securely anchor even at the stormiest season of the year in the open roads, where the water is perfectly calm. The origin of this deposition of mud, has never been satisfactorily accounted for. It imparts a dirty colour to the water and makes it thick and slimy. It has shifted more or less within the last century, but not to any great extent. A similar deposit exists at Narrakul about 29 miles north of Cochin, and the advantage of this latter place, as a natural open harbour for shipping, has recently been brought to the notice of the British Government.—*H. D.*

MUDRA RAKSHASA, or Signet of the Minister, an ancient political Sanscrit drama by Visakha Datta perhaps of the 12th century. The events dramatized relate to the history of Chandragupta, the Sandracottus of the Greeks. Rakshasa was the minister of Nanda and afterwards of Chandragupta. In one scene Viradha Gupta visits Rakshasa and a conversation ensues which relates to historical events,

Rak.—What news from Pashapur?

Vir.—I have not much to tell sir, where shall I commence?

Rak.—With Chandragupta's entry in the city. What'er my agents since have done, inform me.

Vir.—You will remember, Sir, when, in close league,
United by Chanakya, Parvateswara
And Chandragupta in alliance, led
Their force against our city,—a wild
multitude

MUDUNA-MOHANA.

Beyond the western streams, and Persia's hosts.

Poured on us like a deluge * * *

In the Mudra Rakshasa, Chandragupta is frequently named Vrishala, a term said to be equivalent to sudra; and Nanda himself was the son of a sudra woman; there can be little doubt that the celebrated Manrya family were of sudra extraction. The Uttara Rama Cheritra, the Vikrama and Urvasi, and the Mudra Rakshasa, contain many illustrations of the hindoo woman's love and affection. In the latter piece occurs an example, in comparatively humble life, of the strong affection of a hindu wife. Chandana Das, like Antonio in the Merchant of Venice, is doomed to die, to save his friend. His wife follows him to the scene of execution, with their only child, and the succeeding dialogue ensues:—

Chand.—Withdraw, my love, and lead our boy along.

Wife.—Forgive me, husband,—to another world Thy steps are bound, and not to foreign realms,

Whence in due time thou homeward wilt return;

No common farewell our leave-taking now Admits, nor must the partner of thy fate Leave thee to trace thy solitary way.

Chand.—What dost thou mean?

Wife.—To follow thee in death.

Chand.—Think not of this—our boy's yet tender years

Demand affectionate and guardian care.

Wife.—I leave him to our household gods, nor fear

They will desert his youth:—come, my dear boy,

And bid thy sire a long and last farewell.

Thus could I sweetly pass a thousand years;

Another author makes a loving woman say:—

But without thee e'en heaven would lose its charms.

* * *

"Pleased to embrace thy feet, I will reside

"In the rough forest as my father's house.

"Void of all other wish, supremely thine,

"Permit me this request—I will not grieve,

"I will not burden thee—refuse me not.

"But shouldst thou, Raghuvu, this prayer deny,

"Know, I resolve on death."

—*Tol's Rajasthan*, Vol. I. p. 613.

MUDUD, an intoxicating drug, in pills of the size of a pepper corn, made of chopped betel leaf and opium: and smoked in a small chillum.—*Herklots*.

MUDUDA, *TAM*. Chloroxylon swietenia, *D.C.*

MUDUGA, *TEL*. *Butea frondosa*. Muduga Oil of *Butea frondosa*.

MUDUNA-MOHANA, *SANS*. from madana, desire, and muoh, to be infatuated.

MUGGAR-PEER.

MADUPU, a certain plant of S. India.

MUFTI. In British India, an officer of a law Court.

MUG, a term applied, by the people of India, to all the Aracanese and to a class of people in the Chittagong district who call themselves Raj Bansi in Bengali, and Myan-ma-gyee in Burmese, doubtless offspring of Behgaloo women by Burmese. Their dress and language is Bengalee, but they are of buddhist faith. The Aracanese Mug are a highly Bengalised class of Rakhooing and call themselves Myama-gyi or great Myama. This race form six-tenths of the native population of Arracan, one-tenth being Burmese and the remainder Hindu. The term Mug is not known to the Aracanese themselves and Wilson says the term Mugh which the British have given to the Aracanese by that people is restricted to the descendants of Aracanese by Bongali mothers.—*Wilson's Glossary*.

MUGA. *HIND*. One of the silk-worm moths of British India. The two principal indigenous varieties of silk are the muga and the eri. A dress made of muga is prized beyond all others, by the Assamese. A plant grows wild in the southern part of the Chittagong district, on which the moth lives.

MUG-DYE-PLANT. The Mug make yellow and red dye, by grinding this plant and its roots into powder, and boiling the same in water. The colours are dull but seem to last for a long time.

MUGANI, *BENG*. *Phaseolus trilobus*, *Ait.*

MUGA SILK. See Cotton manufactures.

MUGGAR-PEER, or the Crocodile-pond, lies to the north-west of Kurrachee. The greater pond is about 300 yards in circumference, and contains many little grassy islands, on which the majority of the crocodiles (*Crocodilus palustris*) bask; some are seen asleep on its slimy sides, others half-submerged in the muddy water while now and then a huge monster raises himself upon its diminutive legs, and waddling for a few paces, falls flat on his belly. The water in the pool feels cold, although fed from two hot springs, one of which is of so high a tem-

MUHABAN.

perature that a visitor could not retain his hand in it, yet animal life exists; for, where the water bubbled up from its sandy bottom, and in the little lake running to the tank, is an abundance of a small black spiral shell, very like *Malania pyramis*, an allied species of which frequents the river Jordan. The crocodiles dig deep in the sand under the neighbouring date-trees and there deposit their eggs. Quantities of deciduous teeth of various sizes, are strewn along the slimy sides of the pond. A guide, taking piece after piece of flesh, dashed it on the bank, uttering a low growling sound at which the whole tank became in motion, and crocodiles splashed through the skulrow water, struggling which should seize the prize. The shore was literally covered with scaly monsters, snapping their jaws at one another. They seize their food with the side of the mouth, and toss the head backward, in order that it may fall into the throat.—*Adams*.

MUHABAN. The Judoon clan inhabit a tract below the Hussunzye country, and on the right bank of the Indus opposite the British town of Torbella, and thence stretching westward. In this tract the most notable place is Mount Mahaban, of classical

MUHAMMADAN.

celebrity. Near the base of Muhaban, and on the bank of the Indus, is the fanatic colony of Sitana. The Syuds of this place are the remnant of the followers of that extraordinary adventurer, Syud Ahmad, who, gathering a handful of mahomedan devotees, from various parts of India, raised a formidable rebellion in Peshawur. After winning and losing Peshawur and Eusufzye, the Syud was eventually slain at the mouth of the Kaghan glen by Sher Sing, the son of maharajah Ranjeet Sing. Most of his adherents, chiefly foreigners to the Punjab, dispersed, and the remainder settled at Sitana; evil-intentioned people who endeavour to rouse the bigotry of the surrounding mahomedan tribes, and especially of the Swat. One of the rulers of Swat was elected to his position from among these very people. They intrigue with the Wahabee fanatic religionists among the mahomedan population in various parts of India. More than once correspondence relating to them has been intercepted. In 1852, they co-operated with the Hussunzye against Jehandad, and seized a small fort belonging to that chief, but evacuated it on the approach of a British Force with Colonel Mackeson.

MUHAMAREE. SANS. From maha great, and mree, to kill, the Asiatic plague.

MUHAMERAH. See Kab Muhammerah.

MUHAMMADAN, a term applied to the followers of Muhammad whose name is also written Mahomed and that of his followers mahomedan and their doctrine mahomedanism or islamism, the last term meaning the saving faith. The muhammadans of India are divided into three great sects, the Suni, the Shia and the Wahabi. The last of these are the reforming party in Islam, consisting of zealous and generally of conscientious men; men of piety in whom the religious instinct is strongly developed, and whose one rule in life is what they consider to be their religious duty. Like the Reformers in Europe they refuse to accept any intermediate interpreters between themselves and their Scriptures, and go back to the Koran direct for their doctrine and faith. Unfortunately, however, the Koran is not suited for the exigencies of a modern nation, but only to the local necessities of a warring Arabian tribe, in its successive vicissitudes as a persecuted, an aggressive, and a triumphant sect. The rugged hostility and fanaticism of the Koran have been smoothed down by many generations of scholars and interpreters; and from its one sided, passionate bigotry, a not unsymmetrical system of civil polity has been evolved. Such Laodicean casuistry the Wahabi indig-

MUHAMMADAN.

nantly reject. They insist on a return to first principles, and wherever they have conquered, their triumph has been subversive alike of settled Government, and of the established muhammadian faith. The Wahabi of India do not go, in questions of doctrine, to the extreme lengths of the Arabian followers of Abdul Wahab. Their first great Indian leader, Sayyid Ahmad, who had been a trooper in the nawab of Tonk's service, was a political before he became a religious enthusiast. It was not till he required the armed co-operation of his countrymen that he became a seer of sights and a dreamer of dreams; and the British were very much to blame for the remissness and indifference with which they permitted him to recruit his followers in their territory. Ranjit Singh, against whom the jihad or religious war was directed, was then their friend; and whatever may have been his general faults as a ruler, the only grievances which the muhammadans had against him were his interdict on certain points of ceremonial, and his prohibition against killing cows. The Wahabi of India, therefore, have from the first been rather a political party than a religious sect. Subsequent pilgrimages to Mecca by their leading preachers, have, however, imparted a religious character to the movement which was wanting at first, and such preachers have generally returned from Arabia, ardent, if not very well instructed, disciples of Abdul Wahab. Of late years the religious element has constantly gained strength, and recent political prosecutions have brought them forward as the unshrinking and unselfish devotees of Islam. Since 1865, when it first became really dangerous for a respectable muhammadian to subscribe to the rebellion against the British the sect has been still further isolated, and has been at the same moment deprived both of the support and of the restraints of the well-to-do comfortable classes. A schism has thus sprung up, and practically Indian muhammadans are now divided into two great sections, the first of which comprises the Shia and Suni, men with vested interests, who are naturally on the side of established Government whether political or religious; and the Wahabi or reforming party, under whatever name they may be known, with their uncompromising and fanatical leaders, and the vast ignorant and superstitious multitude who have nothing to lose and everything to gain by a civil tumult. About the year A. D. 1870, the influence of their itinerant preachers was marvellous. A Wahabi missionary has been seen to halt under a Pipal tree at noon

MUHAMMADAN.

and before evening the whole town had flocked to him, and were listening to sedition, within the compound of the Commissioner's house, where he had rested with his pony during the heat of the day. About that year, in one of the Eastern Districts, a rumour spread that a Wahabi preacher had fixed his head quarters in a certain desolate and remote hamlet and would preach there. Forthwith a great encampment formed around him to the number of 6,000 men. The preacher fulminated against the idolatrous rites and priestly superstitions of his countrymen in Bengal. Such merely spiritual declaration was by no means what the people had come off into the wilderness to hear. The result was that before the police had arrived in sufficient force to disperse what was reported by the hindus to be a seditious encampment, the disappointed multitude had scattered; and the constables found the apostle absolutely alone, and dependent for a little rice and milk on the hindu villagers who had rushed to the magistrate's court to complain against him. Of the two recognised sects the Shia take up a ground of their own touching the duty to wage war against the Queen, as they do on all other points. The sect have never been very numerous in India, and have been accustomed to persecutions under the orthodox muhammadian governments such as no British ruler would sanction. The Suni form nine-tenths of the muhammadans in India. But the Shia, although not a numerous body, have contributed some of the greatest names to the history of India. The key-note to the Shia faith is the belief in the twelve Imams, an inspired Apostolic descent from Mahomed. One Imam yet remains to complete the august line. By one sect, it is believed that this imam, the imam Mehdi, is at present hidden away from sinful mortals, but there will come a great Epiphany or shining forth of the Promised One, when all wrongs shall be righted, and all men converted to the true knowledge of God. 'When that innocent Apostle,' says a Pamphlet, 'shall appear, is known only to the All-knowing God, and to no one else. Till then, the Shia argues that it would be vain to attempt by mortal efforts, or rebellions, or wars, to bring about that great consummation. It denounces as schismatics all who disagree with this view. 'Now a days, such of the depraved and seditious as are ignorant of the precepts of Muhammad and strangers to truth, with vain desires improperly indulge in foolish talk about the meaning and duty of Holy War.' 'In this country, Hindustan, only two sects among the followers

of Islam have proved orthodox—the Shia and Suni. The remaining tribes of musalmans, whether they belong to the sect of Wahabi or to the sect of those who are styled Farazi, &c., are such as have wandered from the right path, and cannot be relied upon.' Seven conditions must be fulfilled in order that a jihad, in its meaning of Holy War against the infidel, may become lawful. 'First, when the rightful Imam is present, and grants his permission. Second, when arms and ammunition of war and experienced warriors are ready. Third, when the Jihad is one against mutineers and enemies of God. Fourth, when he who makes Holy War is in possession of his reason, when he is not a lunatic or a man of impaired senses, and when he is neither sick, nor blind, nor lame. Fifth, when he has secured the permission of his parents. Sixth, when he is not in debt. Seventh, when he has sufficient money to meet the expenses of his journey and of the inns by the way, and to pay for the maintenance of his family.' Putting aside the expediency of waging war against Great Britain, and without any reference to the chances of its failure or success, the great Shiah condition required for a Holy War is the presence of the Imam. Hitherto this divine leader has withheld his face from mortal men and has not appeared to lead the armies of the Faithful. Till his shining forth, any attempt at Holy War is presumptuous and sinful. To commit bloodshed, except under the leadership of that Imam in person, is strictly forbidden by the Shia law. Those are the rebels and sinful ones who would revolt without the Divine sanction of the Apostle.' The Suni have again and again declared holy war without the rightful leader, and with them the Shiah have a long account of persecution and martyrdom to settle. The Indian Suni and Shia alike believe in the eventual triumph of the True Faith. But the Suni hold that in the latter days they will carry out the injunction of the Prophet in its entirety, and subdue the whole world to Islam. The Shia, on the other hand, maintain that when that triumph comes, it will be achieved by an amalgamation (although a one-sided one) of the two great religions Christianity and Islam. This dream of universal fraternization in the last days is common to all religions of the nobler type. The hindus have a Book of the Future which foretells a time when all men shall be of one religion and of one caste. Even the Vishnu Purana, compiled in the triumph of hinduism over buddhism, admits that in

the last Iron Age to which we have now come, men shall obtain the liberation of their souls, not in virtue of their religion or their race, but by purity of life and rectitude of action. The Shia¹ musalman have also their millennium, but it is to be reached in association with the christians, who will all become Shia, and probably through the blood of the Suni heretics, who at first will refuse to accept the final Apostle. 'It is distinctly laid down in the Muhammadan Law,' 'that at the time when the abovenamed Imam shall appear, Jesus Christ may safely attend him! shall descend from the Fourth Heaven, and friendship, not enmity, shall exist between these two Great Ones.' It is satisfactory to learn, therefore, that at least one small sect of muhammadans are not bound by the first principles of their religion to rebel against the christian ruler of Great Britain. The Shia all over the world, except in Persia, have been a persecuted people; and, like other hunted sects, have developed a system of casnistry to save their bodies by something very like a denial of their faith. When put to straits by their Suni persecutors, they smooth over the peculiarities of their belief. In extreme peril, as lately in Syria, and from time to time in India, this law of extension, or religious compromise, has allowed them to denounce their most cherished tenets, and even to curse the twelve imams. But under the British Power they have been protected from persecution, and from the temptation to insincerity to which persecution gives rise. The Suni are the most numerous class of Indian musalman, they have been conspicuous in proclaiming that they are under no religious obligation to wage war against the Queen of England and Empress of India. To that end they have procured two distinct sets of legal decisions, and the Muhammadan Literary Society of Calcutta has summed up the whole Suni view of the question in a forcibly written pamphlet. It contains two separate sets of syllogisms starting from contradictory premises, yet arriving at the same desirable conclusion. The Law Doctors of Northern Hindustan set out by assuming that India is a country of the enemy, and deduce therefrom that religious rebellion is uncalled for. The Calcutta Doctors declare India to be a country of Islam, and conclude that religious rebellion is therefore unlawful. It is not however, the well-to-do mahomedans, but the fanatical masses, who stand in need of such decisions. The powers of arrest granted by Regulation III of 1818, to enable the Executive to deal

MUHAINA.

with widely spread treason, such as has from A. D. 1830 to A. D. 1870, been smouldering in Bengal, and from time to time bursting out in conflagrations on the Punjab border, have rendered any dabbling in rebellion a most perilous pastime.—*The Indian Muslims: Are they bound in conscience to rebel against the Queen?* By W. W. Hunter, L.L.D. of the Bengal Civil Service.

MUHAMMAD. See Khalif, Mahomed.

MUHAMMERAH, is situated near the junction of the Jerahi or Tab with the Kuren river; it affords vessels sailing up the Persian Gulf facilities for landing goods, without going on to Basra which lies higher up the stream of the Shatt-ul-Arab.

MUHA NAMBO, TEL. Ponerapah wood or Red wood.

MUHA-NIM, BENG. Evergreen bead tree, *Melia sempervirens*.

MUHA-PATAKA, SANS. from mahat, and pataka, from pat, to throw down.

MUHA-PURUSHA, SANS. from maha, great, and pooroosha, a male.

MUHA-PREMA, SANS. from maha, great, and preman, love.

MUHARRAM, AR. HIND. sacred, unlawful, prohibited.

MUHARRAM. The first month of the mohammedan year, in which it was held unlawful to make war. Among the shia mahomedans this month is held in peculiar veneration, as being the month in which Hasan, and Hasain, the sons of Ali were killed. Their deaths are the subject of public mourning during the first 10 days when fasting and self-denial are also enjoined. The educated of the sunni mahomedans also regard these days as days for solemn thoughts. The uneducated regard the period as a time for a carnival. See Ali, Zynub.

MUHA-ROURUVU, SANS. from rooroo, an insect.

MUHU-RAT'HI, SANS. from maha, great, and rat'ha a chariot.

MUHA-SENA, SANS. from maha, great and sena, soldier.

MUH-ATMA, SANS. from mahia, great, and atman, spirit.

MUHA-VRATA, SANS. vrata is a ceremony to be performed according to a vow.

MUHA-VYADHEE, SANS. from maha, great, and vyadhi, sickness.

MUHA-VIDYA, SANS. from maha, great, and vidya, learning.

MUHBOOB-I-SUBHANI, or Dastageer a mahomedan saint.

MUHDEE WALAX, the name by which Gyr-mahdee mahomedans call themselves.

MUHAINA, HIND. a month.

MUJALLIBAH.

MUHENDRA, SANS. from maha, great, and Indra, the king of heaven.

MUHESHA, SANS. from maha, great, and isha, glorious.

MUHESHWAR. SANS. The Binlang stones, worshipped as emblems of Siva, are formed at Mubeshwar, on the Nerbudda, where a whirlpool occurs and rounds and polishes fallen stones into the form of a lingam. See Hindu, Siva.

MUHESHWARA, SANS. from maha, great, and ishware, glorious.

MUHISHA-MARDINI, SANS. from mahisha, a buffalo, and marda to destroy.

MUHLSTEINE, GER. Mill Stones.

MUHNEE, a rivet near Soopul in Muzaffar nagar.

MUHOORUT-KA-SHIKAR, or the Ahairee, in Mewar, an annual spring festival, in which the wild boar is hunted.—*Tod's Rajasthan*, Vol. I. p. 330.

MUHOOYA, BENG. Broad leaved Bassia, *Bassia latifolia*.

MUHOUSHUDH, BENG. Garlic, *Allium sativa*.

MUHOWA, a streamlet running near Mysore in Banda and Barra Pahara in Gwalior.

MUHLOOD WAZIRI. See Khyber.

MUHUBHURI-BACH, BENG. Zingiber zerumbet.

MUHUR, GUZ. HIND. a Seal.

MUHUTTE, BENG. Solanum melongena.

MUHUTTRANA, SANS. from maha, great, and trana, salvation.

MUI-KI-PHALLI, DUK. *Dolichos faboformis*.

MUINA, BENG. *Paspalum stoloniferum*.

MU-I-PARI, PERS. *Saxifraga stenophylla*.

MUIR, Sir John, a Bengal Civil servant, author of original Sanscrit texts, 4 vols. Lond. 1858-1863.

MU-I-SHUTH, PERS. Camel's hair.

MUJALLIBAH, also called Makloubah, ruins on the east bank of the Euphrates, $4\frac{1}{2}$ miles N. N. W. from the bridge of Hillah, and $1\frac{1}{2}$ north of the Amram Hill. Makloubah means overturned. Near the Mujellibeh, are the remains of Kasr, as well as those of the hanging gardens, and at rather more than six miles from Hillah, standing amidst, and crowning the summit of, extensive masses of ruin, is the Birs, or Bars Nimrud. This has been considered by Niebuhr, Rich, and others, to be the celebrated temple of Belus, and, according to Herodotus, it was separated from the palace by the river. (Lib. i. clxxx.) L'un [des quartiers] est remarquable par le palais du roi, et l'autre par le lieu consacré a Jupiter Belus. The Kasr ruins near Hillah, 750 yards from

MUJOUS.

Amram Hill. The Mujallibeh is a solid quadrangular mound, the sides of which face the cardinal points. Its height is not more than ninety or a hundred feet in the loftiest part; but Sir R. Porter assigns to it that of one hundred and forty feet. It is called by the natives El Mujallibah, "the overturned:" also Haroot and Maroot, from a tradition handed down, with little deviation, from time immemorial. This solid mound is regarded as the remains of the tower of Babel, an opinion adopted by Major Rennell. As the Mujallibah rises to view, it is seen to overtop the intervening banks of several dry canals. It consists of an immense extent of low rounded mounds, of the same nature as that upon the right or west bank of the Euphrates, called the Birs-i-Nimrud. On the left bank there is, first, the Mujallibah, secondly, directly south of it is the Kasr, a heap of buildings, supposed to represent the great imperial palace with the hanging gardens, close to which is a considerable mass of mounds, which some imagine to be a smaller palace. Still further south is the hill of Amram; a more extensive, though less lofty mass than the last, which must comprise the reliques of many and important edifices. To the E. N. E. at the distance of about six miles from the Mujallibah, is an insulated and lofty conical mound, named Al-Heimer: and, lastly, a considerable conical mound, called the Tüebo, and by some considered to be the N. E. angle of the ancient city, stands about fifteen miles to the north of those just enumerated. There are, besides, a vast number of inferior heaps, some of which indicate the courses of canals that irrigated the country, or supplied distant quarters of the city with water, and some are the remains of ramparts which probably inclosed and defended the principal edifices.—*Major Rennell; Mignan's Travels*, p. 10, 161-162.—*Herodotus lib; cclxxx.*

MUJAWIR, a servant who attends the tomb, hermitage, or spot consecrated to a mahomedan saint or person of rank.—*Richard F. Burton's Sindh*, p. 392.

MUJAYAH. See Chaldea.

MULGER.

MUKURUNDU, BENG. *Jaeminum hirsutum*.

MUKWA a tribe of fishermen in Malabar; those of north Malabar follow the rule of descent a matrice but those in the south, permit of descent of property to sons.

MUL, also **Muli**, HIND. a root: pokhar mul is *Dolomiaea macrocephala*.

MUL RAJ. See Solunkhi, Gujarat.

MULA. HIND. *Bassia latifolia Willd.*

MULA. See Bhakta Mula.

MULAIM PERS. soft; an ointment.

MULAKA, SANS. Radish.

MULAKARNE-MARM, TAM. *Toddalia aculeata*, PERS.

MULAKARANG • VARAY PUTTAY, bark of *Toddalia aculeata*.

MULAM PALLAM, TAM. *Mulam Pandu*. TEL. *Cucumis melo* Linn. IV. and A.

MULA NACSHITRA. See Komarpal.

MULA PRAKRITI. See Sacta.

MULATHI. HIND. *Glycyrrhiza glabra*.

MULAYAN, MALEAL. A servile tribe, the same as the Palayan.

MULAZIM. HIND. a servant, also farm servants agricultural hired laborers.

MULBERRY, species of the *Morus* or Mulberry trees and their fruit. In the Panjab there are red and white mulberries, and two sorts of each color, one is a small oval, being rather sweet, but a most miserable fruit. The other, called shahut, is a very long narrow fruit, looking almost like a caterpillar, either greenish yellow or red-black in color; this fruit is somewhat better than the first kind, it is very sweet, but has no flavor. The real shahut, the "royal mulberry" of Kashmir, is a fine, large, sub-acid fruit, it is dried and made into flour, the bread from it is nutritious and fattening. The *Hill mulberry*, or *kimu* is the *Morus serrata*.

Toot or Kurvon, is the *Morus Indica*, a tree of fast growth, attaining its full size in 20 years, when it becomes useful.

The leaves of the red and white mulberry trees form the food of the worm (*Bombyx mori*) yielding the silk of commerce. They are quite distinct from the Philippine mulberry, which is the *Morus multicaulis* of botanists. Beerbloom mulberry gardens are innumerable,—dotting the country in patches of a dark green colour.—*Travels in India* Vol. i. p. 65. *Commissioner Jubbulpore Division*.

MULBERRY, INDIAN. *Morinda citrifolia*, Linn.

MULBOOS-KHAS NAZR, an annual supply of clothing materials formerly sent from Dacca to the emperor of Delhi.

MULCER, a tribe inhabiting the foot of the Anamalai hills very useful in the forest

MULKA NAAD.

preparing elephant ropes from the vaca nar, assisting in the clearing of brushwood and the repair of roads, &c., for which they are paid. See Malai Arasar.

MULETI, HIND. Glycirrhiza triphylla.

MULEZYE, See Khyber.

MULGEDIUM. See Fungi.

MUL GRASSIA. See Grassia; India Kattaywar.

MULHAR RAO. See Holkar. Mahratta Governments in India.

MULI, HIND. Raphanus sativus, radish; any garden root, root of Cochlearia armoracia—Linn.

MULI ABDUR RAHMAN, See Semitic races.

MULI BARANI, HIND. Brassica Grifithii.

MULI-KA. TEL? HIND. Balsamodendron Roxburghianum.—Wall.

MULILA, MALEAL. Xanthoxylon rhetsa, D. C.

MULILI? MARAM. TAM. Gualtheria cerasoides Duval. W. and A. Hook. and Thoms.

MULIM, HIND. Gloriosa superba.

MULIN, HIND. Bignonia Indica, also Solomonthus sp.

MULINGHI, TAM. Radish.

MULK, the third title amongst Indian mahomedans, as Suraj ul Mulk, Sharf ul Mulk.

MULKAH, a stronghold, near the Mahabun mountain occupied by Mahomedan religious fanatics from Hindustan. It is situated on one of the southern spurs of Mahabun. Major James, C. B., Commissioner of Peshawar, induced the Boner tribes not only to surrender after the havoc done among them but to send a contingent of two thousand men with the Corps of Guides to burn down Mulkah. Thus, the elder branch of the Eusufzai repeated the vengeance which they once before took on the fanatics when in May 1831 their fathers rose against Syud Ahmed the founder of the sect, who was then slain at Balakot on the Indus, drove his family to take refuge with the nawab of Tonk who long sheltered them, and expelled his Ghazee followers.

MULEEDA, a cloth made at Amritsar.

MULE FRERN. Memionitis cordifolia.

MULEI, HIND. Farsetia Edgeworthii.

MULEN SCHENA.—? Amorophophallus campanulatus.

MULES seldom go so few as 30 miles in a day, though carrying a load of about 3 cwt., and passing over such kotals or passes, as would appal even a Spanish muleteer. See Iran.

MULKA NAAD, See Korambar.

MUGIL CEPHALOTUS,

MULKAS, TEL. species of Bandusa.

MULKGIRI. HIND. Circuits.

MULKLAVU, MALEAL. Salmalia Malabarica, Schott.

MULLA, also Mullana AR. HIND. a mahomedan learned in the law; a schoolmaster, a mahomedan teacher.

MULLA BARK, bark of Zyzyphus nummularia.

MULLAGHAI. TAM. Capsicum.

MULLAKU, or Muraku, TAM. Wax.

MULLAKUND. See Khyber.

MULLAY MUNTHA-KEERY. TAM. Capsella bursa pastoris.

MULLA MUSTE or Uste, TEL. Solanum trilobatum, L. The Sanscrit is Alarkah, which, though stated to be Calotropis gigantea, is applied to Sol. trilobatum in Telingana. The leaves are used as a vegetable and are believed to improve the intellect according to the verse: "By offering the Alarkah leaves he became a prince," alluding to the servant of a foolish king, who having made his master wise by feeding him daily on uste leaves, was rewarded by promotion to a principedom.

MULLANGI, TEL. Raphanus sativus, L.

MULLEN-BELLERI, MALEAL. Cucumis sativus, L.

MULLEER RIVER, 16 miles from the town of Kurachee.

MULL ELAVA MARAM, TAM. Bombax Malabaricum or Salmalia Malabarica.

MULLELAVOO, CAN. Salmalia Malabarica.

MULLENEE, a river near Jowrah in the Indore territory.

MULLER, Maximilian, a learned German, who settled in England as professor of Sanscrit; editor 1849—1856 of the Rig Veda—1859, author of History of Ancient Sanscrit Literature.

MULLET FISII, Mugil cephalus.

Pathin,	HIND.	Maddava meen,	TAM.
Arabi matchi,	DUK.	Bonta,	TEL.

The mullets spawn largely in estuaries and apparently nowhere else. The seer, Cybrium Commersonii seems to spawn very near the mouths of the estuaries, while others appear to ascend nearly as high as the tidal influence for the purpose. The mullet lives largely on shrimps and sand-worms. A small plot of some four or five acres in the Mangalore backwaters was therefore buoyed off to be left undisturbed for shrimps to breed in.—Ain's Mat. Med. p. 155, Mason. Thomas.

MUGIL CEPHALOTUS. Valenciennes. The Tonnasserim seas have large eyed mullet, valuable for the table and

MULLOH.

common in Calcutta, but distinguished by its small head, smaller scales, and goggle eyes which appear to be starting out of its head.—*Mason*.

MUGIL SUBVIRIDIS.—*Valenciennes*. A small mullet often found in great numbers in the river near Maulmain, many of the Burmese regard it as the young of *M. Cephalotus*, but it is a distinct species.

MULLEZYE; See *Afghan*.

MULLI, TAM. *Solanum indicum*, *Linn*.

MULLIKA, BENG. Arabian jasmine, *Jasminum sambac*.

MULLI KUREY, TAM. *Amarantus polygamus*.—*Linn Roxb*.

MULLOH, a pass in Beluchistan. The Bolan pass on the borders of Saharawan, leads from the Dashti-i-be-dowlut to Dadar, and is the great route of communication between the Western Affghan provinces and the countries opening on the Indus. It is a continuous succession of ravines and gorges. The air in the lower part of the pass is in summer oppressively hot and unhealthy. It extends from $29^{\circ} 30'$; $67^{\circ} 40'$; to lat. $29^{\circ} 52'$, long. $67^{\circ} 4'$ — 55 m.; or $\frac{1}{2}$ m. wide at entrance. The entrance is 800 ft.; Ab-i-goorn, 2,540; crest, 5793 ft. Average ascent, 90 ft. per mile. The Bolan pass with the Mulloh pass, far to the south, are the only level routes intersecting the great chain of mountains, defining, on the east, the low countries of Kach Gandava and the valley of the Indus; while westward, it supports the elevated regions of Kelat and Saharawan. There are many other passes over the chain, but all of them from the east have a steep and difficult ascent, and conduct to the brink of the plateau or table-land. Such are the passes of Takari and Naghow, between the Bolan and Mulloh routes, and there are others to the north of the Bolan. This pass is no less important, as occurring in the direct line of communication between Sind and the neighbouring countries with Kandahar and Khorasan. It also constitutes, in this direction, the boundary between the Sard Sel and Garm Sel, or the cold and hot countries (sard-sair, garm-sair cool-journey, warm-journey.) The natives here affirm, that all below the pass is Hind, and that all above it is Khorasan. This distinction is in a great measure warranted, not only because the pass separates very different races from each other, speaking various dialects, but that it marks the line of a complete change of climate, and natural productions.

The Bolan river is about 70 miles long, the Sir-i-Bolan Pass, in lat. $29^{\circ} 51'$, long. $67^{\circ} 8'$ is 4,494 ft. above the sea. It is

MULTAN.

remarkably sinuous, but runs generally south-easterly; from a junction with the Nari River. It is liable to inundation; and as its bed, in some parts, occupies the whole breadth of the ravine, travellers are frequently overtaken by its torrents. Falls 3,751 ft. in 54 m. from source to Dadar.—*Masson's Journeys*, Vol. I. p. 338. See Kabul, Kamtahir; Kelat.

MULLOO KEERAY, TAM. See Moolokarang Varay puttay.

MULLA, SANS. strong, from mal, to hold.

MULLU. See Kurnbar.

MULLU DOSA KAIA, TEL. *Cucumis momordica*, *Roxb. W. & A*.

MULSARI, SANS. *Mimusops elengi*. *Mulsari-ka-Phool*, HIND. the flowers of *Mimusops elengi*.

MULSARI, a tribe occupying the Anamalai forests. See Malai Arasar, Mulcar, India.

MULTAN, the name of a district and of a town in the Punjab. The town being near the left bank of the Chenab river. Multan district bounds Bahawal-poor on the north. Multan town has had its name repeatedly changed; it is supposed to be the capital of

MULTAN.

the Malli, of Alexander's historians, the place where Alexander was wounded. It was taken by Chach in the seventh Century, and now contains about 45,000 inhabitants. Its gardens are well stocked with fruit-trees, as mangoes, oranges, citrons, limes, &c. Its date-groves also yield much fruit, and vegetables are grown in great plenty. The inundations of the Ravi river extend to the city, but it is three miles distant, and has what is called a bandar, or boat-station; whence there is communication with the Indus, and, consequently, with the sea. The area enclosed within the walls being compactly built over, the city may be supposed to contain not less than eight or nine thousand houses or from forty to forty-five thousand souls. The Multan district produces corn, oranges, palms, sugar, cotton, and indigo. Turkistan and especially the city of Bokhara, supplies Multan with silk of three kinds, namely, Lab-i-abi, Charkhi, and Hoshkari. These silks are purchased respectively in Bokhara from 7, 9, to 12 rupees per seer, and sold in Multan from 10, 12, to 15 rupees. One camel-load of the first kind of silk, which is equal to 6½ maunds in weight, costs at Bokhara 440 tila, or 2,837 rupees 8 annas. Each tila makes 6 Nanakshai rupees and 6 or 7 annas. The trade of Bokhara to Multan is generally conducted by the Lohani and Shikarpuri. They load their goods on camels at Bokhara. Multan indigo, notwithstanding its impurities, is of good color, and therefore possesses the quality which constitutes the chief value of this article. Some imported from Khyrpoor was found superior to that of Multan, and valued at Rs. 10 a maund more. The plant is indigenous both in Sindh and the Punjab; it is exported only to the Persian Gulf, Afghanistan and Bombay. Burton states that the people of Multan murdered Shams of Tabriz, the celebrated Murshid, or spiritual teacher, and the more celebrated Hafiz, in order to bury him in their town. The Afghan Hazara, he says, make a point of killing and burying in their own country, any stranger who is indiscreet enough to commit a miracle or show any particular sign of sanctity. Multan city was conquered by Shahab-u-din in 1171. Multan fortress, with Multaj and garrison after a prolonged siege, surrendered unconditionally to the investing Indian Army on the 22nd Jan. 1849. In the time of Akbar no less than seventeen districts or separate pergunahs, were attached to the province of Multan. All that General Cunningham can identify are Uch, Diraiwal, Moj and Marot,

MUMASENNI.

all to the east of the Sutlej. The old town of Uchh is situated on the eastern bank of the Panjnad, 70 miles to the south-south-west of Multan, and 45 miles to the north-east of the present confluence with the Indus at Mithunkot. He thinks, also, that Uchh must be the Iskandar, or Alexandria, of the Chuch-namah, which was captured by Chach on his expedition against Multan.—*Richard F. Burton's Sindh*, p. 357-8. *Mohan Lal's Travels*, p. 392. *Masson's Journeys Vol. I.* p. 396. *Vigne's a personal Narrative*, p. 17. *Cunningham* p. p. 219-243. *Ancient Geog. of India* p.p. 215, 243. See India, Kabul, Malli, Punjab, Khetri, Khyber, Kulm, Raien.

MULAGRAHI. SANS. From mala, filth, and grahin, receiving.

MULUGU CHETTU or Togaru chettu TEL. Morinda citrifolia, L—R, i. 541. These names seem to be applied indifferently to *M. citrifolia* and *M. tinctoria*.

MULU MODUGA or Badadam. TEL. *Erythrina subolata*, R. iii. 254.—W. and A. 801. Br. applies this to Amora (or Andersonia) rohitaka. W. & A. and conjecture with probability that *E. subolata* is a var. of *E. suberosa*.

MULUKA RASARI. TAM. *Eumeta Cramerii Westw.* Wood Moth.

MULU KIRI. TAM. *Amarantus spinosus*. Linn. *Roeb. W. Ic.*

MULUK-UT TAWAIF. See Persian kings.

MULUM KUNDUM. SANS. root of a plant.

MULU MURUKA. TAM. *Erythrina Indica, Lam.*

MULUNG, a rude pagan tribe on the hills of Assam on the eastern frontier of the Mikir and Cachar. See India.

MULUNGU. See Semitic races.

MULU TOTA KURA. TEL. *Amarantus spinosus*. Linn. *Roeb. W. Ic.*

MULU-VILLARI. TAM. *Cucumis sativus*. Linn.

MULU VEMPALI. TEL. *Tephrosia spinosa*. Pers. *Galega sp. R.* iii. 383; G. pentaphylla, 384.

MULVI. A mahomedan learned in the Koran, the plural is Mulla.

MUM.—? A fermented liquor, brewed principally from the malt of wheat.—*Faulkner*.

MUMANI. HIND. *Sageretia Brande-thiana* also *Arnebia echinoides*; peil mundi is *Tanacetum vulgare*.

MUMANRAI. HIND. PSHU. *Sageretia oppositifolia*.

MUMASENNI. One of the aboriginal tribes of Persia.—*Malcolm's History of Persia*, Vol. i. p. 27.

MUMTAZ MAHAL.

MUMAT AR. or death, created on the tenth day of Mohurram.

MUMDOTÉ. A Cis Satalj state, it is a mahomedan chieftaincy, and was re-established in 1868.

MUMGO-PISIN. MALAL. Gum of *Moringa pterygosperma*.

MUMIAI. The *Mumia orientalis* of the ancients, mentioned by Dioscorides (iii. 99), was obtained from Persia, was deemed of singularly healing qualities, and hence named *Sarcocolla*. Ouseley mentions that at $1\frac{1}{2}$ mile from Khesvieh village, which belongs to the territory of Darabjerd, he sketched the Koh-i-Mumiy or "Mummy Mountain," situate within three or four miles. It is an interesting locality from the mumiai or mummy, produced in its internal cavities. It is a blackish, bituminous matter which oozes from the rock, and is considered by the Persians as far more precious than gold; for healing cuts and bruises, and causing fractured bones to unite. In the vicinity of this Momiai cavern is a village called Ayin (or rather Ayi) the name of which has been compounded with mum or "wax" so as to form the word mum-i-ayi or "the wax of Ayi. The more concise account, given in Ebn Hankal's translated work (p. 133) sufficiently agrees with this. *History of the Manners and Customs of Ancient Greece*, Vol. iii., p. 406. Baron C. A. De Bode's *Travels in Luristan and Arabistan*. p. 324. *Ouseley's Travels*, Vol. ii., p. 119. See *Asphalte*, *Petroleum*, *Momiai*, *Sarcocolla*.

MUMMURTTI, the Hindu Triad, consisting of Brahma, Vishnu, and Siva or Isvara; literally three forms from mur three and mur't forms.

MUMMY, the Egyptians believed in the re-occupation of the body, by the soul, and their object in preserving the body was to have it ready for the re-entry of the soul after completing its period of migrations. The mummy cases of Egypt were made of the wood of *Cordia myxa*.

MUMTAZ MAHAL BANU BEGUM, or, more briefly, Mumtaza Begum, was the daughter of Asoph Jah, and the niece of Noor Jehan. She was twenty years married to Shah Jehan, and bore him a child almost every year. Bernier says, she was that extraordinary beauty of the East, whom the emperor loved so passionately that his conjugal fidelity was never it is said, impeached while she lived. The death of the Begum occurred on the 18th day of July 1631 occasioned by her giving birth to a daughter, who is fabulously said to have been heard crying in the womb by herself and her other daughters.

MUNCHETTY MARAH.

The sultana died in 2 hours after the birth of the princess. Her husband, Shah Jehan erected over her remains a magnificent tomb, known to Europeans as the Taj-Mahal, a corruption of Mumtaz Mahal. Tavernier says that, in building the Taj, twenty thousand workmen were employed for twenty-two years in its erection and he states it was erected by a Frenchman of the name of Austin de Bordeaux. The brick scaffolding is said to have cost as much as the building itself. The marble had been presented by the rajah of Jeypore, and was brought from its quarries, a distance of 140 miles, upon wheeled carriages. Her husband died in A. D. 1666. In the middle of the apartment, underneath the great cupola, are the cenotaphs of the royal pair. They lie side by side, the empress to the left. Her name, Mumtaza Mahal Banoo Begum, and the date of her death, 1631, are read on the slab. That of her husband and the date of his death, 1660, are also inscribed upon the other tomb. *Tr. Hind.* Vol. i., pp. 413, 414.

MUN. BENG. *Crotalaria laburnifolia*.

MUN also Turunjabin. ARAB. Manna.

MUN or Maund, forty seers or eighty pounds, a measure of weight. See Maund; weights and measures.

MUNA, according to some mahomedans, the place where Adam was buried. See Abu Rubays.

MUNA. BENG. *Crotalaria laburnifolia*. *Linn. Rheede. Roxb. W. & A.*

MUNAGA. TEL. *Moringa pterygosperma*, *Gert. W. & A.* 545—*Ill.* 77.—*Hyperanthera moringa*, *R. ii.* 368. *Rheede. vi.* 11. *Munaga-kaia*, the pods. *Munaga-koora*, the greens. *Munaga-poo*, the flowers. *Munaga Vayroo*, the root.

MUNAI. TAM. Castor.

MUNAKKA. HIND. *Vitis vinifera*, dried grapes, common seed raisins.

MUNAL. HIND. The munal or monal pheasant, *Lophophorus impeyanus* called also nilgir.

MUNAS, a river near Byagorah in Rung poor.

MUNCIIA-KUNDA, TEL. *Amorphophalus campanulatus*.

MUNCHAR. See Lakes; Munchur.

MUNCHEEASHEE. See Kush or Cush.

MUNCHETTY MARAM. MALAYALA. A tree of little value which grows in Malabar and Canara, to about 25 feet in height, and 18 inches in diameter: it is used by the natives for coasting vessels and house building.—*Edye, Forests of Malabar and Canara.*

MUNDAH.

MUNCHI NOONAY, Tel. Gingelly or Sesamum oil, oil of Sesamum orientale.

MUNCHUR LAKE, amid the generally arid, dreary, and sterile character of the scenery of Sindh, Lake Munchur forms a fair expanse of calm transparent water, lying beneath the mountains and surrounded with rich foliage. *Postan's Personal Observations*, p. 9.

MUNDA-PHORA, Guz. A mahomedan mendicant in the west of India, who, to extort charity, draws blood from his own head or other parts of his body; from moonda the head, phorna to break.

MUNJENATI WOOD, also Munjenati maran, ANGLO-TAM. is 'used for making doors, stocks to matchlocks, and for other purposes. *Ains. Mat. Med.* p. 208.

MUNJUN, HIND. Dentifrice made of charcoal, of betel nut, of almond shell, or of frankincense and alum.

MUPAN, or Moopen, MALEAL. a class of slaves in Malabar.

MURDA-FAROSH. PERS. Seller of the dead.

MURDDHABHISHIKTA, SANS. A mixed caste, sprung from a brahman father and kshatriya mother, and following the profession of arms.

MUNDAH, a race occupying the eastern and southern parts of Chota Nagpore. The Mundah, Ho and Oraon are all divided into families, called Kili or Clan, and may not take to wife a girl of their own kili. Manki is the name applied to the Mundah chiefs, in the southern parts of Chota Nagpore. The Manki, of Chota Nagpore have acquired considerable estates. The Mundah and Ho houses are more isolated with better accommodation than those of the Oraon, with verandahs, and separate apartments for the married and unmarried members. Every Mundah village has its own dancing place. The Mundah comprise about two-thirds of the population of the five pergunnahs of Silli, Tamar, Barundah, Rahay and Bundu, all others being recent settlers. But many of the Mundah Kol have been dispossessed of their ancestors' lands, by middlemen, brahmins and rajputs. The Mundah settlements are chiefly in the eastern and southern parts of Chota Nagpore. The Mundah and Sontal are amongst the ugliest of mankind, the Sontal being remarkable for good nature and ugliness. They are more like Hottentots than Negroes.

Munda features are flat and broad. The extreme features of this race are high cheek bones, small eye orbits often with an oblique setting, flat faces, without much beard or whisker, and in colour from brown to tawny

MUNDAH.

yellow. The richer people of the Mundah, who aspire to be zemindars, wear the poita, reverence brahmins and worship kali, but the mass continue in their original faith. The great propitiating sacrifices to the local deities are carousals, at which they eat, drink, sing, dance and make love, and the hindus settled in the province propitiate the local deities. The Mundah country is arranged into Purha or divisions, each consisting of twelve or more villages under a chief, and the chiefs meet, at times for consultation.

Many of the Oraon and some of the Munda clans or kili, are called after animals, the eel, hawk, crow, heron, &c., and the clans do not eat the animal whose name they bear. The dead of the Moondah and Ho are placed in a coffin along with all the clothes and ornaments used, and all the money the deceased had, and all burned. The larger bones are preserved till a large monumental stone can be obtained, and the bones interred below it. The Ho near the houses, the Oraon separate from the village. They are taken to the tomb in a procession, with young girls bearing empty and partly broken pitchers, which they reverse from time to time to show that they are empty. The collection of these massive grave stones under the fine old tamarind trees is a remarkable feature in Kol villages. The stones are sometimes so large that the men of several villages are required to move them. The bones are put with some rice into a new earthen vessel, deposited into the hole prepared for them and covered with the big stone. The Munda and Oraon races are fond of field sports and all game, large and small, disappear from near them. They form great hunting parties. Fishing and cock fighting are also resorted to. The Munda and Ho have a shamanite religion. They have no worship of material idols, but Singbongu, the sun, is the supreme being, the creator and preserver, a beneficent deity; they have secondary gods, all invisible and generally malevolent; sacrifices to Singbongu are made of fowls, pigs, white goat, ram and buffalo.

The Oraon worship the sun under the name of Dhurmi, as the creator and the preserver, and offer white animals to him in sacrifice.

Mundah, Ho and Oraon are all divided into families, called kili or clan, and may not take to wife a girl of their own kili.

Manki, is the name applied to the Mundah chiefs, on the southern parts of Chota Nagpore.

Mundah and Ho houses are more isolated, with better accommodation than those of the Oraon, with verandahs and separate apartments for the married and unmarried members. Every Mundah village has its own

MUNDLA ARU.

dancing place. General Cunningham Suggests, pp. 505 507 that the Munda are the ancient Marunda.—*Campbell*, pp. 150 151. *Major Dalton*, pp. 76, 94, 154, 158, 159, 160, 163, 168, 188-89, 196. *Major Dalton*. *Mr. G. Campbell*, p. 181.

MUNDANE. See Myen-mo.

MUNDANE EGG. See Lakshrai, Vedas.

MUNDAPA, in hindu temples, is the part of the building known in architectural nomenclature as the "pronaos." The word is also written Mundaf, also Mantapam. The mindra or cella, in hindu temples, contains the statue of the god. The Mindra, dedicated to the linga, is a double-roofed Gothic building; the body square, but the upper part short and tapering to a point. It contains one, two, three, or more rooms, about three cubits by four, with a porch in front for spectators. The centre room contains the lingam. Mindra, says Mr. Ward, means any edifice of brick or stone; but custom has appropriated it almost exclusively to the temples of the lingam.—*Ward's View of the Hindoos*, vol. ii. p. 1.

MUNDAREH.—? *Bauhinia acuminata*.

MUNDARE-KAI, TAM. This fruit grows in the extreme southern parts of the Peninsula, and is eaten by the common people.—*Ainslie*, p. 241.

MUNG-KA-DAL, HIND. *Phaseolus mungo*.

MUNG-KHONG. About the 14th century of the Christian era, the Lau were a powerful and conquering people in the upper portion of the basin of the Irawadi, where their capital was at Mo-gaung (Muang-gaung or Munk-khong) and whence in A. D. 1224, they sent an expedition which subjugated Assam and established Ahom rule. Their native country was a portion of the basins of the Mekong and the Menam, including Yunnan. About the same time, they took possession of a higher portion of the upper basin of the Mili, where their chief seat was at Khamti, whence the name by which this branch is still known. At present, the Lau, under the names of Shan and Khamti, are found in Upper Assam, and scattered over a large portion of the northern half of the basin of the Irawadi, nearly to the confluence of the Khyen-dwen with the principal

MUNIA.

stream. Scattered villages are even found in Arakan; on the eastern side they are scattered along the Sa-luen as far as 18°. The whole of the Menam basin is in their hands, with the exception of a small part of the right side near its head; and they also occupy a large portion of the basin of the Me-kong. The eastern tribes are known as Lo-Lo, Lau and Thai.

MUNG-KUDU, MALAY. *Morinda umbellata*, produces a dye stuff. The best dye is procured from the bark of the roots of three year old plants. It is one of the commonest red dyes in India; though the colour is dull, yet it is considered faster than the brighter tints obtained from other substances.

MUNGLAD, a river near Surahan.

MUNG MYIT. See India.

MUNGOCHAR a valley, southward of that of Moostung, more circular in form, and of much less extent; destitute of trees, save a few stunted mulberries. See Baluchistan, Kelat.

MUNGOH. HIND. A climbing plant of the Himalaya, growing 20 to 30 ft. high.

MUNICIPALITIES.

karka. Lind.

MUNIA PECTORALIS. One of the genus of birds called Munia. See Birds.

MUNICIPALITIES. The Mahratta people have, amongst them, outside every village, the pariah or dher, whom they designate the Mhar; the tanner who is called Mhang, and inside the hamlets dwell the Dhor, or tanner. In Hindustan and Bengal the republic or village system has been greatly disturbed by the repeated inroads and conquests of foreign races and the long period of mahomedan rule and the village officers and servants are less complete. But, even there, the headman and the accountant are almost invariably retained and some of the other officers and servants are also to be found and in most instances the offices are hereditary, are capable of being mortgaged or sold; are paid by recognized fees and perquisites, by allotments of grain at the time of harvest or sometimes by portions of land held rent free or at a low quit rent. In the Canarese and Mahratta countries the village authorities are still ruling. They greatly vary in number and in duties, but there are office holders who claim to be descendants of the persons who first settled and at dates long before the oldest of the European dynasties were established. Potails in the Mahratta country, trace their descent from persons who settled a thousand years ago and more in the villages they now hold and the same is to be found amongst the Reddi and Gauda of the South and East, it is this that preserves the Indian villages from the changes which would otherwise have occurred from the irruptions of the Aryan, Brahui, Jat, Persian, Tartar, Rajput, Arab, Moghul, Afghan, Portuguese, French and British. Amongst the Mahratta, office bearers are known as Balute or Alute; amongst the Canarese, as Ayakarru, Ayagarru or Ayangaulu. The following Municipal officers may be enumerated:

Head officer, styled Potal, Reddi, Gauda.
Assistant do. or Changah.
Accountant, or Kalkarni.
District do. or Despandi.
Chaudari, or convener of trades.
Money-changer, assayer, gold and silver-smith, or Potadar.
Barber or Bhawi or Nai.
Washerman, Parit, Dhoobi.
Temple servant, or Garao.
Carpenter or Sutar.
Potter or kumhar.
Gatekeeper or watchman, usually a pariah or Mhar, Mhang, Ramusi or Bhil, called eskar, veskar, tallari.
Waterman do. do. do.

MUNIPORE.

Astrologer or Josi.

Shoemaker or Mhang.

Bhat or Bard.

Maulana or Mulla, a mahomedan priest.

Corn meter.

Blacksmith.

Notary.

Sweeper.

Tailor.

Physician.

Musician.

The Mahratta village head, the potail, rents the lands to cultivators, collects the Government land tax, and forwards it to the tahsildar. He is also the Civil Magistrate, and settles petty civil matters to the extent of two maunds of grain, or four or six rupees and sends higher claims to the tahsildar. In criminal matters he is only the police, and sends all to the Amin. In lieu of pay for the above services, the potail is allowed from 25 to 50 bighas of land, rent free, the land tax being about Rupees 3 or 4 the bighah. For the cultivation of his rent free lands two to four bullocks would be needed because, from 10 to 16 bighas, according as the rains are heavy or light, are all that a pair of bullocks can get over. There are generally, two or four potails in a village, not always of the same caste, for instance the village of Khanpur, zillah or Nandair has four potails, two Mahratta, a Canarese speaking lingact, and a Kulkargah, and there are a few brahman and mohamedan and pariah potails, but a Christian potail is unknown.—*Wilson's Glossary.*

MUNIET. MALAY. Bezoar.

MUNI GANGARAYI TEL. *Thespesia populneoides.*—*Wall.*—*R.* iii. 191.

MUNI KIRE, TAM. *Premna integrifolia.* *Roxb.*

MUNIPORE, lies between the valley of Cachar and the Burmese provinces, and in the centre lie the 7000 sq. miles of the Munipore territory. It has the Kalanga range of 4800 feet. The Muniporees are in constant dread of raids from Cachar and from Burmah. The Burmese bring ponies, gold and gems from the east. Its population is about 50,000, revenue in money Rs. 12,000 to Rs. 15,000. Munipore, is the ancient Munpara of the Maha Bharata. The country was originally peopled by a Scythic race, known as the Naga, from their worship of the snake. Their conversion to hinduism was so recent as the beginning of the 18th century, but up to the middle of the 19th century, many of the Munipuri remembered the time when in most families, half of the members professed hinduism, and were called clean, and the other half followed their old Naga customs and

MUNIPORE.

were called unclean. Neither the language of Munipore nor those tongues of the people of the N. E. have any affinity with Sanscrit. On the eastern frontier, the people are an entirely different race from the Kuki of the Chittagong jungles. The name by which they are commonly known is "Tipperah." In physiognomy some of them are like the Munipooree, but the greater part bear more resemblance to the Khasiah tribes having strongly marked Calmuk, or Mongolian features, with flat faces and thick lips, not in general shorter in stature than Bengali, and far more muscular and strongly made. Many of them, with fair complexions scarcely darker than a swarthy European. The villages contained perhaps from 100 to 200 inhabitants each, and each house is raised on bamboo piles 4 or 5 feet from the ground. Up to about the year 1714 the annals of Munipore possess but little interest. In that year Gareeb Nawaz succeeded to power. He made several successful invasions of Burmah, but made no permanent conquest. Gareeb Nawaz had three sons, named Sham Shae, Oogut Shae, and Burut Shae. Oogut Shae murdered his father and his elder brother, but was expelled by Burut Shae, who reigned two years, and was succeeded by Gooroo Sham, son of Sham Shae. Gooroo Sham associated with himself his brother Jai Sing, and they ruled alternately until Gooroo Sham's death, about 1764, when the sole authority fell to Jai Sing. After the death of Gareeb Nawaz the Burmese invaded Munipore, and Jai Sing having sought the aid of the British, a treaty of alliance, offensive and defensive, was negotiated on 14th September 1762. On the death of Jai Sing in 1799, the country was distracted for 25 years by the efforts of the sons to succeed, but by the treaty of Yandaboo one of the sons was declared independent but there have been repeated commotions since. The area of Munipore is 7,584 square miles and its population is about 75,840. The money revenue is about Rs. 14,250 a year. Munipore pays no tribute to the British Government, and its relations with the British Government are conducted through a Political Agent of whom the first appointment was made in 1835.

Hills lie between the two British Provinces of Assam and Cachar and the north-western portion of the territory of Burmah. It is an immense extent of mountainous country, inhabited by numerous mountain tribes. And in this great mountain tract one or two valleys occur. The largest—that of Manipur—is, from its connection with the British Government, and from the tribes around it all

MUNIPORE.

admitting its supremacy, the most important. It is between latitude $23^{\circ} 50'$ and $25^{\circ} 30'$ North, and longitude $93^{\circ} 10'$ and $94^{\circ} 30'$ East, the mountain tract in question is bounded on the north and west by the British Provinces of Assam and Cachar, and on the east by the Kubbo valley now subject to Burmah. To the north-east and south, the boundary is not well defined, and would much depend upon the extent to which the Munipore Government might spread its influence amongst the hill tribes in those directions, but in the north-east it may be denoted by a line drawn north from the north-western corner of the Kubbo valley, until it strikes the Assam boundary and in the south by one drawn west from the source of the Numsailung river, the fixed south-east boundary, till its junction with the Tooyai river. Of the space comprised in these bounds, the valley of Munipore occupies nearly the centre. It is called by the Manipuri, "Meitheileipak." The Burmese call it Kathe, the Bengalees, Moglai, and Assamese, Mekle. The area of the whole territory is about 7,584 square miles, and that of the central valley about 650. Much of the valley is at all seasons covered with water. It seems indeed at one time to have formed a large lake, and the piece of water in the south, called the Logtak, appears to be an unfilled but rapidly filling remnant of it. From the most credible traditions, the valley appears originally to have been occupied by several tribes, the principal of which were named Koomul, Looang, Moirang and Meithei, all of whom came from different directions. For a time, the Koomul appear to have been the most powerful, and after its declension, the Moirang tribe. The population is composed of different classes. The principal is the Meithei, next the Phoongnai, after whom the Teng kul, the Ayokpa, the Kei, the Loe and Mahomedan. The Meithei population is divided into four parts called "Punnah" which are designated in the order of their seniority "Kaphum," "Lai phum," "Ahnloop" and "Niharoop." The Loe population consists of people who pay tribute, and is considered so inferior that the name Meithei is not given to it. The inhabitants of the hills around the valley of Munipore, in the west are known under the general appellation of Naga and Kooki. In Munipore they are all embraced in the term Hau, but Koupooce, Quoireng, or Koireng, Khongjai, Kamsol, Anal-Namfan, Aimole, Kom, Cheeroo, Chote, Pooroom, Muntuck, Karnum, Murring, Tangkool, Loochoopa, Moc, Muram, Miyang-khang, and Gnamoi are the names in use amongst Munipore to distinguish the

MUNJA CADAMBA.

principal tribes, and though each of these tribes has a distinctive name of its own, often quite different from the Maniporee one. The Munipur and other tribes inhabiting the hills round Manipur, the Koupooli, the Mowsamuram, and Murring, as M'Lennan points out on the authority of M'Culloch, are each divided into four families, Koomrul, Looang, Angom, and Ningthaja, a member of any of these families may marry a member of any other, but the intermarriage of members of the same family is strictly prohibited. The marshes of the south in the vicinity of the Logtak afford a retreat to serpents of a formidable size, and the whole valley of Manipore is much infested by the serpent tribe. Some of them are exceedingly active and bold as the Tanglei. It is foud of ascending bamboos, along the branches of which it moves with great velocity, and if enraged, throws itself from an extraordinary height upon the object of his anger. His bite is said to be mortal. This, added to his great activity and fierceness makes the Tanglei an object of much terror. The Munipur, a dominion on the east of Bengal is ruled by a hindu rajah, in treaty with the British.—*Wheel. Hist. of India*, p. 421-2. *McCulloch's Records of Government of India Foreign Department*, pp. 34, 41. *Atchison Treaties*, &c. pp. 121-22. *Lubbock civilization* See Munipur. Shan.

MUNI, in the hindu religion, a sage, ancient holy or learned men, styled also Rishi, to whom great deeds and the sacred books are ascribed. The siccation or drying up of the vale of Kashmir and of the Nepaul valley is ascribed to two Muni. See *Brahmadica. Inscriptions* p.389. *Lords of Created Beings*; *Hindoo*.

MUNI KARKUTSANDA. See Buddha.

MUNJ, HIND. *Saccharum sara*, and *S. munja* also *Eriophorum comosum*, very useful grasses, very common in many parts of North India, and known under several names. Two inch ropes, often 50 fathoms in length, made of Munja fibres are sufficient for dragging their largest or 1,200 maund boats up the Indus, against the full force of the stream. The rope is also light, so advantageous for rigging, and bears without injury, alternate exposure to wet and to subsequent drying; both qualities being essential for a tow-rope. The upper leaves, about a foot or so in length, are preferred, they are collected into bundles and kept for use.—*Royle Ind. Fibres*, p. 30. See *Cordage*, *Grass*; *Rope*, *Saccharum*.

MUNJA CADAMBA, TEL. *Nauclea cordifolia*.

MUNORAMA, a river near Amorha in Goruckpoor.

MUNRIVEE, HIND. Eleusine coracana. *Gart. Roeb.*

MUNRO. Sir Thomas, G. C. B., a Madras infantry officer, who rose to the rank of Major-General. He was Collector of the Ceded Districts, of the Bara Mahal, and as Commander of a division of the Madras Army in the third Mahratta War, he took Sholapoor and settled the whole of the country between the Ceded Districts and the Southern Mahratta country. He was afterwards Governor of Madras and died of cholera near Ghooty in 1827 aged 65. He was an able administrator and a statue by Chantrey in which he is seated on a horse in still life, has been erected in Madras to his memory. An inscription to his memory says near this stone are deposited the remains of Major-General Sir Thomas Munro, Bart. K.C.B., Governor of the Presidency of Fort Saint George, who after forty-seven years of distinguished Civil and Military services, seven of which he passed at the head of that Government under which he first served as a cadet, was suddenly called from his labours on the 6th of July 1827, at a moment when in the language of the Honorable Court of Directors. "he was on the point of returning to his native land in the enjoyment of well earned honors from his sovereign and from the Company, having recently manifested a new proof of his zeal and devotion in retaining charge of the Government of Madras after he had intimated his wish to retire therefrom, rendered the discharge of the duties of that high and honorable station peculiarly arduous and important. *Æt. 65.*" Sir Thomas Munro was from the earliest period of his career remarkable amongst other men. All those who were associated with him at the commencement of his service, many of whom have since become illustrious in the annals of India and of their country, yielded to him with common consent that pre-eminence which belonged to the ascendancy of his character. The resources of his mind rose

MUNRO.

superior to every emergency of Civil Government or Military enterprise, and he united to these great qualities an unpretending modesty (that exalted sign of innate worth) which courted no applause, and which would have obstructed his advancement had not his transcendent merits in the cabinet and in the field forced him into public notice and elevated him to the highest office of this Presidency. Another monument says "Major General Sir Thomas Munro Bart and K.C.B., Governor of Madras, died at Puttendah on the 6th of July 1827, and was interred at Guoty, where the Court of Directors have erected a monument to his memory: his remains were afterwards removed to the seat of Government, and his widow has raised this stone to mark the spot where they are deposited." The successful march which he made westwards to Sholapoor, in the third Mahratta war, indicated the highest administrative and military ability and his connection with the ryotwar revenue system in use in Madras was of great value to the country. He was a principal agent in arranging the land settlement of the Madras presidency, which still prevails.

Under British rule the three land tenures are known, as the zemindari or permanent settlement made in 1792 by Lord Cornwallis, of Bengal proper, and since then extended to Behar and Orissa, in which the lands are divided amongst middlemen, who pay a quit-rent to Government, which in Bengal has been definitely settled and something similar to this has been proposed for Oudh as the Talukdari.

Under the Ryotwari tenure in Madras, recognized by Sir T. Munro, the cultivators are the owners of the soil and pay direct to Government. A modification of this has been introduced into Bombay.

The Pattadari tenure was established by Mr. R. Martins Bird in the North West Provinces, and it has since been extended to the Punjab. In this, Government deal direct with village communities who are jointly responsible for the assessment.

In Bombay and Madras, Government transacts its revenue business, direct with the cultivating ryot or farmer, who is regarded as the fencer or proprietor paying a feu duty, and so long as that is paid he cannot be dispossessed; neither in Bombay nor Madras, is there any middleman. In Bengal, however, the British took up the zemindar system, who under mahomedan rule, had been partly a rent-collector and partly a landed proprietor, and elected him to be owner to the exclusion in many cases of the rights of the cultivators. Subsequent-

MUNTA MAMIDI.

ly, the Government, to the exclusion of the real owner elected the tenant or the village community. In Bengal and Oudh, the land tax is still levied on estates: in northern India on villages and proprietary holdings, and on individual fields. But in Madras, and Bombay, the tax is levied on the blocks of 10 or 12 acres according to the convenience of the occupiers.

MUNSA SIJ, BENG. *Euphorbia ligularia*, Roxb.

MUN SEED. *Menispermum cordifolium*.

MUNSHARI in its central part is studied with a multitude of small villages and hamlets, the spring and autumn residences of the Jwari Bhotia, all these places are crowded together.

MUNSAKANTA, BENG. *Cactus Indicus*.

MUNSIF, AR. An officer of a Law Court, a Judge with limited jurisdiction.

MUNSOOR ALI KHAN. An almost direct road from Hoomayoon's tomb near Delhi, leads to a mausoleum of nawab Munsoor Ali Khan, Sufdar Jung, one of the umra of Delhi. Before the accession of the British dominion, he and his ancestors, it is said, held the Soobahdaree of Oudh. This native nobleman's remains were either interred here or the building answers the purpose of a cenotaph. It is a substantial work of red stone so common in many of the edifices of Delhi. It is in many parts relieved with marble, is surmounted by a large white marble dome, forms a structure of some magnitude and is said to have been erected about A.D. 1690. The tomb stone on the upper floor and on a line with the sarcophagus is a chaste piece of sculpture of white marble, and the leaves which surround its base form an excellent and neat specimen of the power of the chisel in the hands of art. The mausoleum is situated in the centre of a large area of enclosed ground laid out into a fine garden and occupies an isolated position on the main road which connects Delhi with the Kootub.—*Tour in India by French*, p. 13.

MUNSOOR COTTAH, a seaport town in Ganjam.

MUNTA, BENG. *Ischemum aristatum*.

MUNWAR PIALA.

Cashew-nut oil, Munta mamidi vittu; the Cashew Nut.

MUNTA MANDU, TEL. *Desmodium triflorum*, D. C. W. and A.—*Hedysarum trif.* R. iii. 353; H. reptans 354.

MUNTJAK of the Sundanese, Kidang of the Javanese and Kijang of the Malays of Sumatra is found in Banka, Borneo, Java and Sumatra, is the *Cervulus vaginalis* of Boddart and Gray and the *Cervus muntjak* of Zimmerman.

MUNTJACUS VAGINALIS; Gray, syn. of *Stylloceros muntjak*—H. Smith.

MUNTOPUM, small open hindoo temples standing near the larger ones, into which the figures of the deities, are placed on being brought from the latter, on days of festivals, for worship.—*Colo. Myth. Hind.* p. 390.

MUNTRA, SANS. in hindooism, a prayer, an invocation, a charm. Mantra is a Sanscrit word derived from matr, to repeat in the mind. The great mantra of the brahminical hindoo is styled the Gaetri, and is deemed the holiest verse of the Vedas; it is an invocation to the sun. There are six descriptions of charms, or mantras known in Goozerat, which are described in a series of works forming the Scriptures on the subject, or the Muntra Shastra. A charm called Marun Muntra has the power of taking away life; Mohun Muntra produces ocular or auricular illusions; Sthambhun Muntra stops what is in motion; Akurshun Muntra calls or makes present anything; Wusheckurun Muntra has the power of entralling; and Oochatun Muntra of causing bodily injury short of death—*Rasmala, Hindoo Annals*, Vol. ii. p. 403. See Gaetri; Hindu.

MUNTRA DROOMA, SANS. from manan to meditate, and drooma, a tree

MUNTYLUM, TAM. Petroleum: naphtha, literally Earth oil.

MUNUDUA MUDDU, TEL. *Desmodium triflorum*.

MUNUGU TAMARA, or Mudugu TEL. *Marsillia quadrifolia*, L. Byoron munugn, meaning submerged, and tamara, an aquatic plant generally.

MUNUSA, SANS. from manas, mind.

MUNASA a hindoo goddess, the queen of the snakes, or she who protects men from their fatal bite. The lower orders crowd to the three annual festivals held in honour of this goddess.

MUNUSIJA, SANS. from munn, mind and jann, birth.

MUNWAR PIALA, amongst the Rajput races, a favourite expression, and a mode of indicating great friendship, "to eat off the same platter (thali), and drink of the same cup

MURÆNIDÆ.

(piala)." (Tod's Rajasthan Vol. I p. 183.) relates how a rajput pledged another's health and forgiveness in the munwar piala, on which they made merry, and in the cup agreed to extinguish the remembrance of the feud.

MUNWAS a principality in subordination to the rajah of Rewa.

MUNWUNTARA, SANS. from Manoo, a sage, and antura, a limit.

MUNYAHJO NAREE, SINDI. species of saccharum. See Graminaceæ; Munj; Saccharum.

MUNYU, HIND. *Artemisia sacrorum*.

MUNZAT, HIND. *Rubia cordifolia*.

MUNZI, HIND. *Eriophorum comosum*.

MUONG or Muang, a tribe who inhabit the mountains on the west of the Tonkinese province of Thanh-Hoa-noi, and stretch into China. They are evidently an extension of the aboriginal or uncivilized Lau of Yunam. The name is the Lau term for town or village which is scattered over so large a portion of the Chinese maps of Yunnan, indicating the present limits of Lau in that province.

MUOOA, BENG. Broad leaved Bassia, *Bassia latifolia*.

MUOOREE, BENG. Anise or sweet fennel. *Foeniculum panmori*.

MUOOL, BENG. *Bassia latifolia*.

MURÆNIDÆ, a family of fishes of the sub-class Teleostei, order Physostomi in the group Murænia. These fishes have an elongated and often cylindrical body, covered by a thick and soft skin in which the scales are deeply imbedded and scarcely apparent. They have no cæca, but nearly all are furnished with a natatory or swimming bladder. In the first group, which constitutes the great genus *Muræna* of Linnaeus, the opercula are small, and enveloped in the skin; the gill-opening is small, and is situated far back, an arrangement which, by more completely protecting the branchiæ, permits these fishes to live a long time out of water. They have no ventral fins. The group comprises 1 species of *Myroconger*, about 100 species of *Muræna*, 6 species of *Gymnomuræna*, 2 species of *Enchelycore*, with species of *Leptocephalus*, *Hyoprus*, *Tilurus*, *Stomiasunculus*, *Esunculus*, *Porobronchus* and *Prymnothomus*. The East Indian genera and species of the Family are;

MURGHAB. The valley of the Murghab is traversed in its whole extent by a river which bears its name. It takes its rise in the Bulverdi, or, perhaps, even the Ardekan hills. It is the same which in Sir Robert Kerr Porter's "Travels in Persia," &c., is called the Kur-ab, and is the Medus of the ancients. After it assumes the name of Polvar, passing close to the ruined city of Istakhr, it enters the plain of Merdasht, having the Hussein-Koh, with the sculptures of Naksh-i-Rastam to the right, and the Koh-i-Rahmat with the bas-reliefs of Naksh-i-Roheb, and the ruins of Takht-i-Jamshid, to the left. The Polvar runs in a southwesterly direction across the plain, and joins the

MURIATE OF AMMONIA.

Kum-Firuz (ancient Araxes) near the bridge of Pul-i-Khan, serving in its latter course as a line of demarcation between the districts of Merdasht to its left, and Hafrek to the right. Across the river is the dam or Bandamir (Bendamir) built by Amir Azan Dilemi.—*Baron C. A. De Bode's Travels in Luristan and Arabistan*, p. 75. Ferrier.

MURGHAB. To the north of Herat and Kabul is a range of undulating country, which in some places assumes a mountainous, in others a hilly character, and in some parts, is well watered, in others bleak and rough, forming a water shed of two natural divisions, from the west of which flows the Murghab, the Tejend and the Furrah-Rud, and from the east, the Helmund, the south eastern feeders of the Oxus and the north western feeders of the Kabul river. The hilly, mountainous, country is occupied by the Aimak or Char Aimak and the Hazara. The Murghab rises in the Hazarah hills, north of the continuation of the Hindoo Koosh ridge and south of Mymuna and, running west 70 miles, turns northwards, and quitting the hills passes through a desert country, for about 200 miles to join the Oxus three marches west of Bokhara. In the cold season its breadth is 270 miles and it is $2\frac{1}{2}$ feet deep.

MURGHABEE also Margali, Duk. Sansoviera Zeylanica Willd. Margabi ka Gudda, its root. See Murga.

MURGHI, HIND. A bird, a fowl, a hen.

Sal-ammoniac,	ENG.	

This salt is met with in every Indian bazaar. It is obtained in Egypt and S.E. Asia from the unburnt extremity of brick kilns in which manure of camels' dung has been used as fuel. It is manufactured largely in the Kurnal district, by the potters or kumhar of the Kaithal and Gula tahsil by submitting refuse matter to sublimation in closed vessels. From 15,000 to 20,000 bricks made of dirty clay are put around a brick kiln and when the kiln is fired, crude muriate of ammonia exudes from the dirty bricks in two forms, the inferior kind, called kham mitti, is 20 to 30 maunds and sells at eight annas the maund; the better kind, called papri, does not exceed one or two maunds and sells at Rs. 2 or Rs. 2½ the maund. The Kham mitti is purified by

MURID.

sifting and repeated solution and crystallization up to the fourth time. It is then boiled for nine hours and the resulting salt resembles the raw. The better kind is then sifted, mixed with, and the product put into a large pear shaped glass vessel with a brick $2\frac{1}{2}$ feet long and 3 inches in diameter and mouth closed. In China, it is obtained in Lau-chan-fu and Ning-hia in Kan-Su. The volcanic mountain of Peh-ting in Turfan is said to yield an ammoniated salt. It is used in the arts, as a flux or solder and also in medicine. *Powell Hand Book* pp 89-90 *Smith. Mat. Med. Waring Manual of Therapeutics.*

MURIATE OF SODA. Salt, common salt, or chloride of sodium, is obtained from sea-water by evaporation, also occurs native and is likewise obtained from saline soils. Mineral salt, of very fair quality is obtained in Mysore, Bellary and Hyderabad, is known to occur also in the Guntoor and Nellore Districts, and to be almost invariably accompanied by gypsum, magnesian limestone, sandstone, sulphur, red and brown iron ores, and alum slate. See Salt, Salt Range.

This acid is a solution of the gas in water. The Arabs were probably acquainted with it, and the Hindoos knew, it by a name equivalent to spirit or sharp water of salt. The commercial acid is always of a yellow colour. It commonly contains as impurities a little sulphuric acid, nitrous acid, perchloride of iron, chlorine, and bromine. It is prepared by pouring the oil of vitriol of commerce on common salt in earthen or iron vessels, especially since the extensive manufacture of carbonate of soda from sulphate of soda. Its density,=1180.—*Royle*, p. 46.

MURICH or Murth BENG HIND. Piper nigrum. Muricha. BENG and HIND. Capsicum frutescens.

MURICIA COCHINCHINENSIS. MURID, AR. Amongst mahomedans a dis-

MURIDÆ.

ciple, a pupil, particularly a pupil of a murshad or head of a sect of the darvesh. Amongst those who crave for other aids to salvation, some seek the spiritual advice of a holy man, who is reckoned a pir, or religious teacher, and by certain secret words and signs are initiated as his murid or disciples. Others, even men of rank, adopt the darvesh or fakir life of the religious mendicant devotee, often attended with solemn rights of investiture, and followed by the severest of ascetic rites; but the bulk of these mendicants are, in India, idle, dissipated men, and a few are of very degraded manners. They arrange themselves into the followers of certain pir or spiritual guides, and those met with in India are the Kadria or Banawa; Chastia; Shutaria; Tabqatia or Madaria; Mallang; Rafai or Gurz-mar; Jalalia; Sohagia; Naksh-bandia and Bawa Piray. All these have their own rules and customs; some of them are ascetic devotees, eating if given to eat, but never begging; some largely use intoxicating fluids and vegetable substances; some, as the Salik have wives, the Majzub and Azad have no wives, and some of the Calendars marry and some do not.

MURIDÆ, the rat tribe of mammals of the order rodentia or gnawing animals. The family includes the Jerboa, the Dipodidæ or Jerboidæ of authors; the tribe may be thus shown,

Shining Brown Rat.

MURIDÆ.

The pindi-koku, or pig-rat, inhabits all the peninsula of India.

Mus sotifor, Horsfield.

M. gigantous, Linn.

Allied to the *M. Baudicota*, but clearly distinct as a species. Inhabits Sumatra Java, Borneo and Penang. "The larger of two individuals, captured in gardens, measured:—head and body $10\frac{1}{2}$ inch, tail $7\frac{1}{2}$ inches. (Cantor.) In his Br. Mus. Catal. Dr. Gray mentions a 'black variety,' and a "brownish variety with face brown" from Tasmania.

Mus rufescens, Gray.

M. flavescens, Elliot.

M. musculus, Cantor.

Inhabits Penang.

Mus decumanus, Pallas, *Glires*, 91; Buffon, H. N. viii. t. 27.

M. javanus, Pallas apud Schinz.

M. norvegicus, Buffon.

To this species Dr. Gray refers (with a mark of doubt), in his Catalogue of Mr. Hodgson's collection, the *M. decumanoides* Hodgson, (neo Waterhouse, nec Horsfield), which does not appear to have been described; also *M. brunneus*, Hodgson's *Ann. Mag.* N. H. xv. (1845) 267.

Mus decumanoides, Temminck (neo Hodgson), is given in Dr. Horsfield's Catalogue of the Mammalia in the Indian House Museum: two specimens, from Bengal, presented by Gen. T. Hardwicke perhaps *M. nemoralis*, Blyth?

Mus rattus, L. (Buffon, H. N. vii 278, t. 30). The European black rat comes from vessels into the ports of Calcutta, it differs in no respect from others received from France. Mr. Elliot in his Catalogue of Mammalia in the Southern Mahratta country notes it as "rare" and Mr. Layard includes it from Ceylon, where Dr. Kelaart obtained one individual in a house, in Trincomali, remarking that he had not seen it from any other part of the island.

Mus rattoides, the black rat of Nepal, is similar to the black rat of Europe.

Mus brunneusculus, the brown rat of Nepal, is similar to the brown rat of Europe.

Mus Andamanensis, Blyth, J. A. S. xxix. 103.

M. nicobariensis? Scherzer, Zoology of Novara Expedition.

The indigenous rat of the Andaman Islands. Length about 8 inches; tail the same, ears much as in *M. decumanus*.

M. nemoralis, Blyth, J. A., S. B. xx. 168, resembles *M. rufescens*, except in being considerably larger, much less rufescent above,

MURIDÆ,

and the under parts are merely paler or dull greyish brown, occasionally somewhat albescent. Length about $8\frac{1}{2}$ inches tail $9\frac{1}{2}$ inches hind-foot $1\frac{1}{2}$ inch.

Mus niviventer, Hodgson, J. A. S. v. 234; *Ann. Mag. N. H.* xv, (1845) p. 267, a house rat. Proportions and characters of the last (*rattoides*), but tail rather shorter, and long piles of the pelage rarer.

Mus robustulus, Blyth, J. A. S. xxviii 294. *M. rufescens*, Gray? var? Blyth. *M. rufescens*, auct. of Burma and Penang *M. rattus* brown var, apud Blyth, J. A. S. xvii. 559? perhaps also *B. Berdmorai*, nobis, J. A. S. xx. 173.

Mus rufescens, Gray, *M. N. H. N. S. I.* (1837) p. 585, apud Gray.

M. flavescens, Elliot. | *M. rufus*, Elliot.

M. arboreus, B. Ham. Horsfield's Catalogue.

M. mountainus, Kel. | *M. kandianus*, Ell.

Tetragonurus, Kelaart, J. A. S. xx. 169. 185 figured by the name of *M. arboreus* in one of B. Hamilton's unpublished coloured drawings. (Vide J. A. S. xx. 168).

Mus palmarum, Scherzer, from the Nicobar Islands, probably belongs to this group.

M. cinnamomeus, Blyth, J. A. S. xxviii. 294. "Like *M. flavescens*, but smaller, with proportionally longer tail and softer fur of a fine bright cinnamon colour, with inconspicuous black tips, the under-parts white, which is abruptly divided from the cinnamon hue above.

M. Berdmorai is thus described:—Length about a foot, of which the tail is not quite half. Ears posteriorly $\frac{3}{4}$ inch. Hind-foot $1\frac{1}{2}$ inch. Fur shortish, even, coarse and hispid, but not spinous, of one quality, with no long hairs intermixed. Its colour grizzled grey (dull brown) above unmixed with rufous below and on the feet, white.

Mus nitidus, Hodgson, *Ann. Mag. N. H.* xv. (1845) p. 267. "Distinguished for its smooth coat or pelage, wherein the long hairy piles are almost wanting. It is a house rat, like *M. niviventer*, but much rarer, and frequents the mountains rather than the valleys.

Mus horietes, Hodgson *Ann. Mag. N. H.* xv. (1845) 268. Dwells in houses and out-houses. A small land species with fine pelage, and no peculiarity of physiognomy or proportion.

Mus fulvescens, Gray, Catalogue of Mr. Hodgson's Specimens, p. 18. "Fur pale fulvous, hair very soft lead coloured, with

MURIDÆ.

bright yellow tips, and interspersed with slender black bristles; throat, belly, and beneath, pure white; tail elongate-nearly bald, cutting teeth, narrow skull about 1 inch, 2 lin.; hind-feet about 1 inch.

Mus æquicaudalis, Hodgson, described in Horsfield's Catalogue, p. 144. "Pure dark brown above; with a very slight rufescent cast in a certain aspect; underneath from the chin to the vent with interior of the thighs, yellowish-white.

Mus concolor, Blyth, J. A. S. xxviii. 295. (the young); and *M.* (unnamed), p. 294 ibid (the adult). Common small thatch rat of Pegu and Tenasserim provinces.

Mus oleraceus, Bennett, P. Z. S. 183, 2 p. 121.

M. oleraceus et (olim) *longi caudatus*, Elliot.

M. dumeticolæ, Hodgson, and the young?

M. porvensis H., Ann. Mag. N. H. xv. (1845) 268-2.

M. dumecolus, Hodgson (undescribed.)

Mus badius, Blyth, J. A. S. xxviii. 295. Like *M. oleraceus*, but the eye fully twice as large and black whiskers; colour of the upper parts a more rufous chestnut or cinnamon hue; of the lower parts white, almost pure.

Mus gliroides, Blyth, J. A. S. xxiv. 721. "This has very much the aspect of the British dormouse (*Myoxos avellanarius*); but the colouring is much less bright, though inclining to the same hue.

Mus peguensis, Blyth, J. A. S. xxviii. 295. A field mouse with tail longer than the head and body, well clad with hairs that become longer to the end.

The series next following consists chiefly or wholly of house mice.

Mus urbanus, Hodgson, Ann. Mag. N. H. xv. (1845), p. 969.

M. dubius? H., ibid. p. 268.

M. musculus, apud, Elliot et Kelaart.

M. mami, Gray, (undescribed.)

Mus homourus, Hodgson, Ann. Mag. N. H., xv. 1845, p. 268.

M. Nipalensis, H. J. A. S. x. 115 (undescribed.)

The common house mouse of the Himalaya hill-stations, from the Punjab to Darjiling.

Mus crassipes, Blyth, J. A. S. xxviii. 295. Like the preceding, but with the tail rather longer than the head and body.

Mus Tyleri, Blyth, J. A. S. xxviii. 296. "Length $2\frac{3}{4}$ inch, tail the same (having about 24 vertebrae).

Mus Bactrianus, Blyth, J. A. S. xv. 140. Presents a very close approximation to *M.*

MURIDÆ.

musculus in size, proportions and structure, inclusive of the conformation of the skull; but the fur is much denser and longer, and its colouring absolutely resembles that of a pale specimen of *Gerbillus indicus*, except that there is no whitish about the eyes, nor is the crown of a deeper hue, and the tail is thinly clad with short pale hairs to the end.

M. gerbillinus. Entire length of male 5 inches of which the tail is $2\frac{3}{4}$ inches, hind-foot $\frac{3}{4}$ inch ear-conch barely $\frac{1}{2}$ inch. Female rather smaller.

Mus Theobaldii like *M. gerbillinus* (Bactrianus) but larger with comparatively shorter tail and larger feet.

M. nitidulus, Blyth, J. A. S. xxviii, 294, House mouse apparently, with tail equal to the head and body; and uniformly furnished with minute setae to the end; ears large and ample. It is the house mouse of Shway Gheen on the Sitang, colours like *M. Decumanus*.

Mus cunicularis, Blyth, J. A. S. xxiv. 721. A small field mouse remarkable for its ample ears, and tail shorter than the head and body.

Mus Darjeelougensis, Hodgson, dusky brown above.

Mus erythrotis, Blyth, J. A. S. xxiv. 721. A very different form of mouse from *M. glioides*, and equally different from the common house mouse.

Mus infralineatus, Elliot M. S.

M. Elliotti, Gray, (undescribed).

nec Golunda Elliotti, Gray, Br. Mus. Catal. Mamm. p. 110.

The largest of the group.

Mus corvicolour, Hodgson, Ann. Mag. N. H. xv. (1845), p. 268.

M. albidiventer, Blyth, J. A. S. xxi. 351.

Distinguished by its short tail.

Mus fulvidiventris, Blyth, J. A. S. xxi. 351.

M. cervicolor? Hodgson, apud Kelaart, Prod) Fauna Ceyl., p. 63.

Length about $2\frac{3}{4}$ inches; tail (vertebræ) $2\frac{1}{2}$; tarsi to tip of claws $\frac{3}{4}$ inch.

Mus atrophiatas, Hodgson, Ann. Mag. N. H. xv., (1845) p. 268. A field mouse closely allied to *M. cervicolor*, but seemingly distinct.

Mus terricolor, Blyth, J. A. S. xv. 172. This much resembles *M. lepidus*, Elliot, in form and colour, but the face is very much shorter and the fur short, soft, and not spinous in the least degree.

MURIDÆ.

Leggada spinulosa, *Blyth*, J. A. S. xxiii, 734. Nearly allied to *M. platythrix*, *Sykes*, but of a dark dusky colour above, with fulvous tips to the softer fur, below and all the feet dull whitish.

Leggada jerdoni, *Bl.*, n.s. Bright, dark ferruginous above, pure white below; some fine long black tips intermingled among the spines of the back, limbs marked with blackish externally, the feet white.

Leggada platythrix.

Mus platythrix, *Bennett*, P. Z. S. 1832, p. 121.
M. saxicola, *Elliot*, M. S. S.

Light sandy brown, white beneath, the flat spines less developed than in the two preceding species.

Leggada lepidus.

Mus lepidus, *Elliot*, *Madr. Journ. L. Sc.* x. 216.
L. booduga, *Gray*, M. N. H. J., 1837 p. 586.

Similar to the last but smaller, and but weakly spinous.

Golunda Elliotti, *Gray*, M. N. H. 2nd series, i (1837), p. 586.

neo *Mus Elliotti*, *Gray*, Br. Mus Cat.

Fur pale brown, with minute, very slender, hair-pointed black tips. Chin, throat, and beneath whitish.

Golunda coffæus.

Mus coffæus, *Kelaart*, *Prodromus* 1852, p. 67.

Head and body $4\frac{1}{2}$ inch, tail 4 inches. This rat in Ceylon is destructive to coffee trees. Whole plantations are sometimes deprived of buds and blossoms by these rats.

Golunda miltada, *Gray*, M. N. H. 2nd series, i, (1837), p. 586. Length of body and head $4\frac{1}{2}$ inches. Fur very soft, mouse-coloured varied with black, chin, and beneath, whitish.

Golunda newera, *Kelaart*, *Ann. M. N. H.* 2nd series viii. (1851), p. 339. Length of body and head $3\frac{1}{4}$ in tail $2\frac{1}{2}$ inches. Fur soft, yellowish-brown varied with black; chin and beneath yellowish-grey; under-fur dark lead colour; soft long hairs on the upper parts of the head and body, with long black-tipped hairs having a subterminal yellowish band, fur of belly dark lead-colour, tipped with yellowish-grey.

Hapalomys longicaudatus, *Bl.*, loc. cit. Received from Schwe Gyne on the Sitang river.

The above is an epitome of the long and perplexing series of Indian Muridæ, so far as the published descriptions of them can help to identify any species under observation.

Dr. Kelaart's *Mus arboreus*, *Buch. Ham.* is *M. nemoralis*, *Blyth*, p. 168. *M. indicus*

MURLI.

Geoffry, apud *Blyth*. *M. Tetragonurus*, *Kelaart*, Mr. Blyth takes to be *M. rufescens*, *Gray*; *M. musculus* apud *Kelaart*, to be *M. mami*; and *M. Asiaticus*, *Gray*, apud *Kelaart*, (*Paddy-field rat*), is undescribed.—*Mr. Blyth in Beng. As. Soc.* 1864, *Journ.* v. 32, p. 327-353.

Mus araneus, *Mygale* or shrew mouse, amongst the Egyptians was, according to Bunsen, sacred to Butu or Mut, and was worshipped in Attribis.

Mus ceylonicus, *Kelaart*, a rat found only in the Ceylon cinnamon gardens.

Mus bandicota, *Bechst.* the Bandicoot rat is a favourite article of food with the coolie labourers who visit Ceylon, it attains on the Ceylon hills the weight of two or three pounds, and grows nearly to the length of 2 feet. It feeds on grain and roots, its flesh is said to be delicate, and much resembling young pork. The sides of the hills of near Yank-arekh, kunduz were found by Moorcroft plentifully peopled by the bushy-tailed rat, the *Mus hamster* of Pallas. A large spotted lizard was also frequent, burrowing in holes in the ground.—*Moorcroft's Travels*, vol. ii. p. 417. *Tennent's Sketches of the Natural History of Ceylon*, p. 44.

MURIKI DUMPA, or Ijedi gaddi, TEL. *Roxburghia gloriosoides*, *Dry.*

MURINA SUILLUS. See Cheiroptera.

MURINGE, MALEAL. *Moringa pterygosperma*, *Gærtn.*

MURKA, a river of Sylhet.

MURKANTA, BENG. *Acalypha Indica*.

MURKING, a river near the Cossyah hills.

MURKI KHEL, in former times fire-worship existed to a certain, if limited, extent in Afghanistan, as is evidenced by the pyrethra, or fire-altars, still crowning the crests of hills at Gard-dez, at Bamian, at Seghan, and at other places. Near Bamian is a cavern, containing enormous quantities of human bones, apparently a common receptacle of the remains of Ghabar corpses. At Murki Khel, in the valley of Jelalabad, and under the Safed Koh, human bones are so abundant on the soil that walls are made of them. There is every reason to suppose it a sepulchral locality of the ancient Ghabar; and, as if to leave no doubt of it, coins are found in some number there. See Kafir.

MURKOO-MAHAM, TAM. *Erythrina Indica*, *Lam.*

MURKUNDA, a river near Narraingurh in the Subathoo circle.

MURLAH, a township in Mewar, inhabited by a community of Charuns.

MURLE, TAM. ? *Sansevieria zeylanica*.

MURLI, several of the Indian races, the

MURLI.

Dhangar, Dher or Pariah, Mang or Chakili, Koli and Manurwara and occasionally, even the higher hindoo castes, under various vows, devote their girls to their gods. The deity to whom the girl is more frequently vowed, is some incarnation of Siva and his consorts. Amongst the Mahratta people on the western side of India, Kandoba, is the usual Siva avatar, to whom the girls are devoted and his chief shrines are at Jejuri, Khanapur near Beder and at Malligaon. The ordinary people believe that from time to time, the shadow of the god comes on the devotee (deo ki chaya ati ang par)—and possesses the devotee's person (Murli ki ang ko bhar deta). These devotees are called Murli in Mahratta, Jogni or Jognidani in Cannarese and Basava in Telugu. They, at times, affect to be possessed, during which they rock the body, and people occasionally make offerings to them as to an oracle or soothsayer laying money at their feet, and await the possessing to hear a decision enunciated. The female deity to whom those near the Bhima river are devoted is Yellamah; the Bhooi-koli race devote their Murli to Mata. Boys also are devoted, and styled Waghiu, from "Wag" a tiger. Near Oomraoti it is to Amba and to Kandoba that the Murli and the Waghiu are devoted. The Waghiu does not associate with the Murli. At Oomraoti, the people say that Kandoba particularly moves on Sunday and selects a clean tree (clean Murli) whose body he fills. This idea of the visits of the gods pervades hindu society; it is not the belief that their visits are restricted to these devoted women but that all women are liable to be selected by the deity, the visitor assuming the appearance of the husband. A comely hindu woman is married but without offspring, is supposed to be the subject of such supernatural visitation. So, of old, when Demaratus, says Herodotus, had spoken, to his mother "the mother answered him in this manner!—"Son, because you so earnestly desire me to speak the truth, I shall conceal nothing from you. The third night after Ariston had conducted me home to his house, a phantom, entirely like him in shape, entered my chamber, and having lain with me, put a crown on my head, and went out again." Similarly in the *Bacchæ* of Euripides, the hero says

"For that the sisters of my mother (least
"Becomes it them) declared that not from Jove,
"I sprang, but pregnant by some mortal's love.
"That Semele on Jove had falsely charged
"Her fault, the poor device of Cadmus."

In British History Merlin, and Arthur himself, were both the sons of Bhoote, (*Vide* Geoffrey's History, Book vi., Chap. xviii.,

MURRAIN.

and Book viii., Chap. xix.) to the former of which cases Spenser thus alludes:—

"And soothe men say that he was not the sonne
"Of mortal sire or other living wighte,
"But wondrously begotten and begonne,
"By false illusion of a guileful sprite
"On a faire ladye nun."

In Scotland the story of the Lady of Drumelzier and the Spirit of the Tweed is related in Note M., Lay of the Last Minstrel. In India, the cases of Shooladitya, of Usa and Anirud, and of Kamala Kunwari are similar and Captain Westmacott relates another in an Article on Chardwar in Assam, in the Journal Bengal Asiatic Society, IV. 187, *et seq.* Butler thus satirically alludes to these stories:—

"Not as the ancient heroes did,
"Who, that their base births might be hid,
"(Knowing that they were of doubtful gender,
"And that they came in at a window)
"Made Jupiter himself, and others,
"O'th' gods gallants to their own mothers,
"To get on them a race of champions,
"Of which old Homer first made lampoons.)"

But this satirist's scornful remarks however applicable to a civilized people, are not so to races like those of India, whose belief in spirits is their chief cult.—*Huddibras*, Part I *Canto* ii. v. 211-8. *Ras Mala Hindoo Annals*, vol. ii. p. 379-80. See Jejuri. Kandoh Rao. Krishna.

MURLIDAR or the Tune-ful, a name of of Krishna, represented playing on his flute.

MURMAR, Guz. HIND. Marble.

MURMARI, a village, ten miles from Bandara; the villagers worship at the tomb of an English lady. Similarly, at Assaye, the villagers worship at the grave of an artillery officer who was killed during the battle.

MURMI, a buddhist tribe bordering between Nepal and Sikkim,

MUROOR, BENG. Eleusine coracana.

MUROODOO, TAM. A small tree of Palghant, wood of a light colour, used for build-
ings.—*Col. Frith*

MUROOGANA TALLOW, ANGLO-MAL. See Oil.

MURTOO, SANS. from mren, to kill.

MURO-POLYNESIA. See India.

MURR, ARAB. Myrrh.

MURRA, HIND. *Cynanathus*. Sp.

MURRAIN, from their constant exposure at all seasons, the cattle of the E. Indies both those employed in agriculture and those on the roads, are subject to devastating murrains, that sweep them away by thousands. So frequent is the recurrence of these calamities and so extended their ravages, that they reduce the facilities of agriculture at critical periods of harvest. A similar disorder, probably peripneumonia, frequently

MURRAYA EXOTICA.

carries off the cattle in Assam and other hill countries on the continent of India, and there, as in Ceylon, the inflammatory symptoms in the lungs and throat, and the internal derangement and external eruptive appearances, seem to indicate that the disease is a feverish influenza, attributable to neglect and exposure in a moist and variable climate; and that its prevention might be hoped for, and the cattle preserved by the simple expedient of more humane and considerate treatment; especially by affording them cover at night.—*Tennent's Sketches of the Natural History of Ceylon*, pp. 50, 51.

MURRAVETTY, TAM. *Hydnocarpus incabriens*.

MURRAYA, a genus of plants, the Maikay tree in Tavoy, a species of *Murraya* has a tough close grained wood used for handles. It is not a large tree, but is highly esteemed for handles to spears, knives, &c. The grain is like boxwood, but tough and elastic. Found only in the lower Burmese provinces. The Ash leaved *Murraya*, the Elteriya, of the SINGH, is a timber tree of the eastern provinces of Ceylon, a cubic foot of the wood weighs lbs. 60 and it is said in last from 10 to 70 years. It is used for handles of anamoties, hammers and bill-hooks and as rafters for cadjan roofs. The Karen sometimes furnished. Mr. Mason with specimens of wood a species of *Murraya* scarcely to be distinguished from the box-wood of Europe. Dr. Wallich found *Nauclaea cordifolia* on the banks of the Irrawaddy, which has "wood coloured like that of the box tree, but much lighter, and at the same time very close grained." It may possibly be the same tree, also the *Tonasseri* wood is not light; or it may be a Tavoy tree, which he says has "a strong tough wood, in grinn like box."—*Dr. Wallich, Malcolm's Travels in South-Eastern Asia*, vol. i. p. 190. *Dr. Mason's Tenasserim. Mr. Mendis.*

This is a small but most beautiful shrub of the East Indies and China. The fragrance of its delicate white flowers is delightful and has procured for it the name of the honey bush. *Murraya exotica*, *M. paniculata* and the *Aglaiia odorata*, are cultivated in China as very fragrant shrubs. A variety grows in Ceylon in gardens only, another variety being common in the warmer parts of the island, and up to an elevation of 3,000 feet. In the Dekkan, it is an ornamental shrub,

MURREE.

with beautiful dark green leaves; flowers white, and fragrant in the evening, is to be found in most gardens, and is easily grown by layers or cuttings. Dr. Hooker found the woods of the Rajahat, in the Soane valley full of monkeys, and amongst other plants, observed *Murraya exotica*, but it was scarce.—*Hooker's Him. Jour.* vol. i. p. 44. *Ainslie's Mat Med* p. 162. *Thw. En. pl. Zeyl. Dr. Williams' Middle Kingdom. Dr. Riddell. Mr. Thomson*

MURRAYA KENIGII, SPRENG. syn. of *Bergera konigii*, Linn.

MURRAYA PANICULATA. The Cosmetic bark tree, indigenous in Burmah above Rangoon. A small ornamental, fragrant, flowering shrub with pinnate leaves; flowers white and fragrant, appear in December and January; fruit reddish. Its fragrant bark is more universally used for a cosmetic than sandal wood.—*Riddell. Mason.*

MURREE, a sanatorium, situated on the summit of a ridge at the western extremity of the Himalaya, overhanging the plateau of Rawal Pindi, from which it is 40 miles distant. Its position is 34° N. lat., 73° E. long. and its elevation above the sea level is about 7,300 feet. On the southern slope the vegetation presents the ordinary features of the Western Himalaya, but in a paucity of forms. The general appearance of the station is very striking; though the back ground is less grand than that of Massuri, Simla, Dharmasala or Dalhousie, yet the varied positions of more than a hundred residences on different heights and acclivities, many of them hid in forest verdure, others on naked points of rock form a picturesque landscape. The forests clothing these hills are composed chiefly of 4 species of pine—the deodar or di-ar, *Cedrus deodara*, is found on Mount Mochpura, extending from 7,000 feet to its summit. It grows on the precipitous limestone cliffs, but is not abundant. It is not seen on the Murree range or outer hills towards the Jelam. The "chil," *Pinus longifolia*, covers the lower hills from 2,000 up to 6,000 feet. It grows to a large size and yields a valuable timber, which is strong and durable so long as it retains its resin. This tree abounds, particularly on the northern slopes. The "biar," *Pinus excelsa*, seldom grows below 6,000 and ranges up to 9,000 feet. It resembles the chil, but is of a darker green color, with shorter and finer triangular leaves, having five in a fascicle instead of three, and with a smooth instead of a rough bark. The cones are much longer than those of the chil, and its wood is superior, forming the chief material for house building at Murree. The "pelundar," *Abies*

MURREE.

smithiana, is very abundant. It is tall, straight, and handsome, ranging from 7,000 to 10,000 feet. Trees 10 feet in circumference, 8 feet above the ground, and 100 feet high are not uncommon. The wood is white, and though occasionally used for boarding, is not so good for beams, as it rots quickly if exposed to damp. There are three species of oak; "rinj" *Quercus incana*, never attains a great size. It has a range from 4,000 to 7,000 feet, and frequently forms fine woods on the northern slopes. "Barungi, *Quercus laxiflora*, is a magnificent forest tree, seldom seen below 6,000 or above 7,500 feet. The leaves of the young trees are covered with prickles which are 12 feet in girth, and from 80 to 100 feet high. "Barcha," *Quercus floribunda*, is not common, its timber is very hard and much valued. The maple, "tre-kudna," *Acer cultratus*, is abundant near Murree, but generally small. On Mochpura there are some very large specimens of plane, *Platanus orientalis*. It has convalescent accommodation for 390 men and 117 women. Its population in the season is about 1,000 Europeans, and 3,600 natives. Cholera broke out there in 1858 and 1867.—*Cleghorn's Punjab Report*, p. 198.

MURREE and Boogtee are tribes dwelling in the hills forming a continuous boundary of Sindh and the Punjab. Near Hurrund, the great Sulimani range having run in almost a straight line parallel to the Indus for 300 miles, approaches its termination and joins the Muru Mount, which leads on to the Murree hills, behind which lies the table land, where Kahun, the capital of the Murree tribe is situated. But in front of these Murree ranges there rises a series of sterile rocky hills, which run towards the Indus, and form themselves into an apex near the Gundheroo peak, approaching to within a few miles of the river bank. It is at this point (Shawulla) that the continuous boundary of Sindh and the Punjab has been marked off. These last-named hills, projecting into the Lower Derajat, opposite the cantonment of Asnee, are very thinly peopled. They are crossed by passes leading towards the Murree hills, and are claimed partly by the Murree tribe and partly by the Boogtee tribe, whose hills lie further to the south; but in fact they are not held in strength by any tribe. It is seen, therefore, that the Murree and Boogtee hills, properly so called, are continuous with the Punjab frontier. The head-quarters of both these tribes are situated within the political circle of the Sindh authorities and the relations with both are generally carried on through that medium. The Murree are a

MURSHID.

strong tribe, numbering 3,000 or 4,000 fighting-men. They occasionally committed raids in British territory, in the lower extremity of the Derajat. In 1860, one case was reported against them; in 1853, two; in 1854, one; in 1855, one. They once threatened Rojhan and Kusmors, but dispersed, seeing that preparations were made to receive them. They once attacked a forager's guard from a Cavalry Regiment at Asnee, and killed several men. Living at some distance in the interior, they cannot well make inroads upon British territory without guides. Some of the Boogtee men are serving in the Punjab Cavalry, and many are in the Sindh service. They are subjects of the Khan of Kelat. The original hindoo inhabitants of the Murree and Boogtee hills were driven out by their present occupants, but the natives of Barkhan (the Khetranoo) inhabiting the more mountainous district to the north-ward, were able to hold their own. See Beluchistan Khelat, Khyber.

MURRHINE CUP. The fragments of a murrhine cup, the little Cambay stone cup still made in Cambay, were exhibited in the theatre of Nero, as if, adds Pliny, they had been the ashes of "no less than Alexander the Great himself!" Seventy thousand sesterces was the price of one of these little Cambay cups in Rome in the days of Pompey. The price in Bombay ranges from Rupees 18 to Rs. 35 and Rs. 75. Nero paid 1,000,000 sesterces for a cup, a fact, slyly remarks Pliny "well worthy of remembrance that the father of his country should have drunk from a vessel of such a costly price."

MURBH NEEN, BURN. A tree of maximum girth 2 cubits and maximum length 15 feet. Found abundant all over the Tenasserim provinces on low grounds. When seasoned it floats in water. It looks exactly like deal, but is stated to have no durability.—*Captain Dence*.

MURRUWAT, AR. Generosity, the noble part of human nature, the qualities which make a man.—*Burton's Pilgrimage to Meccah*, Vol. I, p. 56.

MURSEEA, an elegy, dirge or funeral eulogium, lamentations, mourning over the dead. Murseea Khwancee, repeating or singing Murseea.

MURSHEDABAD, a district of Bengal, on the S. W. of Malda and Rajshy, but separated from these by the Ganges. Murshedabad is 124 miles from Calcutta and is famed for its silk. See Jains.

MURSHID. AR. A religious teacher, head of a body of darvesh or fakirs. Irabad AR. an order. A murshid is allowed to admit murid or disciples into the order, as the

MURWA KOLI.

form of diploma is conferred upon the occasion.

MURT. SANS. a form, an idol.

MURTA or Murti. HIND. *Bauhinia racemosa*.

MURTHY WOOD. See Tunker.

MURTIS. ARAB. Amethyst.

MURTOO. BENG. Sage, *Meriandra strobilifera*.

MURTOOTH, also Leela, or Neela, Too-tiah, GUZ. HIND. Bluestone.

MURTUMAN-KULA, BENG. *Musa sapientum*.

MURUA, BENG. *Elcusino coracana*, Gort. Natchenny.

MURUCULA PULLUM, TAM. *Chiron-gia glabra*.

MURUIPORA, SANS. From mara, a dead body, and poora, to burn.

MURUKKA MARAM, TAM. *Erythrina Indica*, Lam. Roxb. W. & A.

MURU KONDA or Pindi or Knppanti chettu, TEL. *Acalypha Indica*, L.—*Il.* iii 675.

MURUKU NAR, MALEAL. Fibre of *Crotalaria juncea*.

MURU MAMIDI or Bodda mamidi, TEL. *Cnpania canescens*.—*Pers.*

MURUNGY KAI, TAM. Pods of *Hyperanthera moringa*.

MURUNGY KEERAY, TAM. *Hyperanthera moringa*, greens.

MURUNGY POO, TAM. Flowers of *Hyperanthera moringa*.

MURUPINDI, TEL. *Acalypha indica*.—*Lin.* Roxb. *Wight*.

MURUTEN NAR, MALEAL. fibre of *Terminalia alata*.

MURUVA, or Murva, SANS. *Sansevieria Zeylanica*. See *Liliaceae*.

MURVI. The Thakur of Murvi is a Jhareja and was the first in Colonel Walker's time to abandon infanticide. He has possessions in Cutch. See Kattyawar, Junagarh, India.

MURVILINGA, or Marvilingum maram, TAM. a Ceylon tree which grows to about sixteen inches in diameter, and eight feet high. It is prized by the natives for sandals and toys, &c. It produces a kind of pod, which, with the bark and leaves, is used with much success in cases of intermittent fevers.—*Edgc. Ceylon*.

MURWA, a mountain.

MURWA. HIND. Marjoram, sweet marjoram.

MURWY KOLI, one of the balotta, in every village in the northern Konkan, and in Bombay families, they are employed as palanquin bearers. Some Koli are settled as soldiery in Angriah Kolaba, and at Bombay and Kolaba, in 1837 were 1,000 families

MURWUT.

and 500 to 600 families at Bassein, employing themselves as fishermen and seamen. At their meetings, whether for congratulation or condolence, they consume large quantities of spirits.

MURWUT, an agricultural and pastoral race of frontier Affghans within the British territories, stout, active men. The valley of Murwut, with its thirsty Murwutland and fine people is the very opposite of Bannoo with its rich harvests and vicious inhabitants. There are two streams, but no wells or water courses. Derahjat is the term applied to the territories styled Derah Ishmail Khan and Dehra Ghazi Khan. The Dehra Ishmael district is divided into two halves by a range of hills running at nearly right angles from the Sulocmanee range to the Indus. The passage from one part of the district to the other is through the Payzoo and Mulezye passes which intersect the range. Above the passes there is the valley of Bannoo with its Wuziri tribe. The Bunoochee are to a certain extent a vicious race. They cultivate with some industry; and are well affected to the government. Below the valley, and immediately above the range is Murwut. The Murwutee are a fine race, of striking appearance loyal to government and both willing and able to check the depredations of their hill neighbours. In Murwut stands the fort of Lukkee. In the hills near the Payzoo pass dwell the Buttanee: once a robber tribe, but reformed since annexation. Their cooperation against the Mushood Wuzerees could be reckoned upon. Below these are two important families, namely, the Gundapoor of Kolachee, and the chiefs of Tank. These two tracts are exposed to attack from the Sheoranee and Wuzerees. The revenues of Kolachee in 1856 amounted to between Rupees 8,000 and 10,000. Of this the Gundapoor receive 25 per cent. on condition of good service in defending the tract. The Tank chief had a lease of the revenues of that tract; he made the collections, which amount to Rupees 65,000 per annum, and received one-third for himself and the establishment he maintained. This lease was conditional on good service in defence of the fief. The chief, Shah Nawaz, is a Pathan of good family; he was ejected by the Sikhs, and after many vicissitudes of fortune he was restored in 1848, at the instance of Major Edwardes. There is also the nawab of Dehra Ishmael Khan; he belongs to the princely race of Suddoozye, and was formerly the Lieutenant of the Dooranee government in the Upper Derahjat and Lower Sindh Sagur Doab. He

MURWUT.

was deprived of his power by the Sikhs. The principal chiefs in the Dehra Ghazee Khan District belong both to hill and to plain tribes. Those sections of the hill tribes who reside in the plains usually behaved well, even at times when their brethren of the hills were in a state of hostility against British subjects. The plain tribes are the Nookkance, Loond and Dreshuk, all of them well conducted; they can muster a certain number of fighting men, but they are unable to resist effectually the marauding aggressions of the hill-men and are victimized by such tribes as the Bozdar and Goorchanee. The plain of the Indus, generally inhabited by Beloches, and called Muckelwand; in the country of the Murwut; and the plains and low hills (about the roots of the mountains) which constitute Damaun Proper. Muckelwand extends along the Indus for about one hundred and twenty miles. Its mean breadth is from twenty-five to thirty miles. The principal town is Dera Ismael Khan. The people are the Jut and Beluch, dark in complexion, and lean and meagre in form; their ordinary dress in summer is of dark coloured cotton; and in winter greyish or striped great coats of coarse woollen cloth, and quilted silk cap? They are perfectly submissive and obedient to the king and his representative. The country of the Murwut is composed of sandy and arid plains, divided by ranges of hills. It depends entirely on rain for cultivation, and in many parts the inhabitants are even obliged to carry water for several miles to supply their families. Half the Murwut are fixed and employed in agriculture. The rest wander about with their herds of camels; living chiefly in temporary huts of branches of trees, with a wall of thorns, and a roof of straw; some few have black tents of the worst description. They are all tall, fair men, and wear a pair of loose trousers, something thrown over their shoulders, and a handkerchief tied round their heads. Their country is about thirty-five miles square, stretching from Bannoo to Muckelwand, and from near the foot of the Sulimani mountains to the short range of hills which separates Saugor from the Indus. Damaun proper, which lies to the south of the Murwat and extends along the foot of the Sulimani mountains, is inhabited by the Waziri, Sheorani and Zimurree, and is of equal length with Muckelwand, but of various breadth, from eight or ten miles to thirty and upwards. It is inhabited by the Dowlut-khail and Gundehpooray, the Mean-

MUSA.

khail, Baboor and Stoorecannee tribes, with the exception of the Gundehpoor, are included in the general designation of Lohanee. The Esau-khail, Murwut and Khyassore also are comprehended under this denomination. Immediately to the south of the Murwutti are the Gundehpoor and Dowlut-khail of which the former are most easterly. West of the Dowlut-khail are the Tuttur, Meeanee, Bitnee and some other small tribes subject to the Dowlut-khail; their country resembles that just described, but is more arid, and worse cultivated, and towards the west it is hilly.—*Elphinstone's Kingdom of Oudul* p. 368. *Records of the Government of India* See Afghan Khyber.

MUSA, a genus of the Musaceæ, the banana or plantain tribe of plants; those are nearly stemless, and Lindley includes in them four genera. Sprenger and Loudon enumerate 12 species in S. America, 2 in China, 1 in Madagascar, 1 in Mauritius, and in the East Indies 12 species of Musa and 1 of Heliconia have been discovered. The following will exhibit the sections and genera of the Musaceæ in the East Indies,

A. Heliconiæ, A. Rich.

Heliconia buccinata, Roxb. Moluccas.

B. Ravenalæ.

Musa paradisiaca, L. All the tropics.

- " regacea, Jacq. Chittagong, Mauritius,
- " superba, Roxb. Dindigul,
- " nepalensis, Wall. Nepal.
- " glauca, Roxb. Pegu.
- " textilis, Nees. Philippines.
- " coccinea, Andr. China.
- " rubra, Wall. Irawadi.
- " chinensis, Suet. China.
- " maculata, Jacq. Mauritius.
- " balbisiana, Culla. Amboyua.
- " acuminata, " "
- " verticillata, " Moluccas.
- " cavendishii, China.
- " ornata, Chittagong.

The fruits of several species of Musa are used as food and for dessert, but the most esteemed is *M. paradisiaca* L. the *M. sapientum* of Roxburgh and other authors; the plantain or banana is the *Muz* or *mauz* of the Arabian writers, whence the Latin term *musa*, now applied to the genus which produces the fruits commonly known as plantains and bananas; as also the fibre so well known under the name of Manila Hemp. The plantain was undoubtedly known by description both to the Greeks and Romans, for Theophrastus, among the plants of India, describes one as having fruit which serves as food for the wise men of India: and which was remarkable both for its sweetness and

MUSA.

for its size, as one would suffice for four men—referring most probably to a bunch of plantains. In the middle of the 19th century, the natives of the south of the Peninsula of India, seeing the spare form of Sir Arthur Cotton, R.E., and his indifference to food when work was to be done, content with a plantain or two, gave credence to the story that he had a miraculous plantain which never decreased though continually eaten by him. Pliny, evidently describing the same plant, informs us that its name was *Paia*, and in Malayalam it is *Vella* and in Tamil *Valle*. Every part, both of the sheathing and the exposed parts of these leaves, abounds in fibre. In the Philippine Isles, *Musa textilis* is indigenous. In the Indian Archipelago, the edible species are common, they extend northwards as far as Japan; in China are found *Musa coccinea* and *cavendishii*; also along the Malayan Peninsula to Chittagong—*M. glauca* being indigenous in the former, and *M. ornata* in the latter locality. In the valleys of the south of the Peninsula of India and of the Dindigul Mountains, *M. sapientum* is found. The common edible varieties of *M. paradisiaca* flourish even in the poorest soils, and also near brackish water. They are extensively cultivated in the interior of British India. On the Malabar Coast, the plantain is everywhere at home. The fruit of those at Bassein is especially well-flavoured, and the plant is particularly abundant in the district of Broach. The plantain is found in the highest perfection in Tenasserim, especially in the province Amherst. More than 20 varieties are known, of which several are peculiar to the country, and the greatest part of them are superior to any to be got in Bengal. They thrive well everywhere without the slightest care. No Burmah or Karen house is to be found without a plantation of plantains. As the latter leave their abodes, at least every 3 years, in order to migrate to fresh localities, they are, of course, obliged to leave their plantain gardens behind them, and therefore these may be found growing luxuriantly in many uninhabited places, until they become choked up by the growth of the more vigorous jungle trees. Natives of Bengal generally prefer the large and coarse-fruited kinds, while the smaller and more delicately tasted fruit is alone esteemed by Europeans. These are cultivated in the most northern, as well as in the southern parts of India; while along the jungle base of the Himalaya there is a suitable climate as far as 30° of the north latitude, for plants of this genus growing in a wild state. That growing in Nepal has been called *M. nepalensis*. A similar

MUSA PARADISIACA.

species may be seen growing below the Mussoorie range, as well as near Nabu. The fruit, however, in all these situations consists of little else than the hard dry seeds. A similar variety of *Musa sapientum*, having seeds surrounded with a gummy substance, instead of fruit-like pulp, was found by Dr. Finlayson, on Pulo Ubi, near the southern extremity of Cambodia. In Batavia also, there is stated to be a variety full of seeds, which is called *Pisang batu*, or *Pisang bidju*—that is, Seed Plantain. In Kumaon and Gurhwal the plantain is cultivated at as great an elevation as 4,000 and 5,000 feet above the sea, and has been seen as far north as the Chumba range at an equal elevation. Major Munro has seen the wild plantain at 7,000 feet above the sea, in the Kondak slopes of the Neilgherries. Though many of the *Musa* plants have been mentioned as distinct species, it is probable that some, at least, are only varieties. As stated by Mr. R. Brown, nothing has been advanced to prevent all the cultivated varieties being derived from one species, *Musa sapientum* (also called *M. paradisiaca*), of which the original is the wild *Musa*, described by Dr. Roxburgh as grown from seed received from Chittagong. Mr. Brown further adds, that it is not even asserted that the type of any of the supposed species of American Bananas, growing without cultivation and producing perfect seed, have anywhere been found. Plantains and bananas are extensively cultivated in various parts of S. America, and at an elevation of 3,000 feet in the Caraccas. They are abundant in the W. India Islands, as well as at considerable elevations in Mexico. To the negroes in the West Indies, the plantain is invaluable, and like bread to the European, is with them denominated the staff of life. In Guiana, Demerara, Jamaica, Trinidad, and other principal colonies, many thousand acres are planted with the plantain.—*Dr. J. Forbes Royle Illust. of Himal. Bot. p. 355. Royle, Fib. Plants. Drs. Roxb. Fl. Ind. Helfer, Mason Tenasserim, Voigt; Hogg, Veg. King. Drury Useful Plants.*

MUSA CAVENDISHI, called the Chinese Banana, bears abundance of fruit.

Of this delicious fruit there is a great variety in the E. Indies. The natives consider plantains as highly nutritious and eat them with cow's milk and sugar as Europeans do strawberries. Europeans also fry it, with butter, and eat it dusted with sugar. A dye is obtainable from the skin of the fruit. Its leaves afford a fibre suited for certain purposes, but inferior in point of strength to Manilla hemp, the fibre of the *Musa textilis*. The stems also yield a fibre. The stem is placed on a board, and the pulpy mass scraped out with a blunt knife, whilst clean water is poured on to wash away the remains of the pulp; the fibres are then dried in the sun. The stalk seldom exceeds seven or eight inches in diameter, and twenty feet in height, bears but one bunch of fruit, and dies, but it throws off new plants. The leaves, when young, are beautiful, expanding with a smooth surface, and vivid green, to six feet in length, and two or more in breadth, but, soon after attaining full size, the edges become torn by the wind. The flower is very large, purple, and shaped like an ear of Indian corn. At the root of the outer leaf, a double row of the fruit comes out half round the stalk or cob. The stem then elongates a few inches, and another leaf is deflected, revealing another double row. Thus the stem grows on, leaving a leaf of the flower and a bunch of the fruit every few inches, till there come to be twenty-five or thirty bunches, containing about one hundred and fifty or one hundred and eighty plantains, and weighing from sixty to eighty pounds. The weight bends over the end of the stem, and when ripe it hangs within reach. Like the palms, it has no branches. In the E. Indies, it is for the fruit, as a dessert, that this plantain is cultivated, but Humboldt calculates that thirty-three pounds of wheat, and ninety-nine pounds of potatoes, require the same surface of ground, that will produce four thousand pounds of ripe plantains, which is to potatoes as forty-four to one, and to wheat as one hundred and thirty-three to one. There are as many varieties of this fruit in Burmah as there are of the apple in England and America; some preferred for cooking, others for eating in a raw state; some sorts grow wild, but in general it is

MUSA TEXTILIS.

exclusively the result of culture. Banana, is a West Indian and Tropical American term for the plantain tribe the *Musaceae* to which, in India, the term plantain alone is given. The edible varieties extend through the Indian Archipelago, northwards as far as Japan, while in China are found *M. coccinea* and *M. Cavendishii*. Again *M. glauca* is indigenous along the Malayan peninsula. Dr. Helfer mentions that 20 varieties are found in the Tenasserim Provinces, and *M. ornata* grows in Chittagong. The Malays reckon forty varieties of the cultivated banana, and the Philippine islanders carry them to fifty-seven, both people having a distinctive epithet for each variety. The qualities are as various as those of apples and pears in Europe, the ordinary sorts being very indifferent fruit. In Khasia the name of the wild plantain is Kairem, and the cultivated Kakesh.—*Ainslie, Materia Indica*, p. 261. *Cat. Abaca,	Tao,	Piswanz-ntan, MALAY,
" brava,	"	Koffo, Mindareo
Bandala,	"	"

The Fibre.

Bandala, Tao.

A plant of the Philippines, said also to grow wild on the western ghats of the Peninsula of India, from Cape Comorin northward, but, hitherto, it has not, there, been turned to any account; in the northern slopes of the Ghats, the plant does not reach a height fitted to afford a fibre of more than two feet in length. Its strength is well known to the Ghat people who employ it occasionally for domestic purposes in rope-making as well as the stem for food. Professor Bikmore states (p. 340) that in Minahassen, this plant is raised from seed, and in the Philippines its fibre is called "bandala," the plant itself receiving the name of Abaca. The plant grows freely at Singapore, from which it was introduced into Madras by Colonel Balfour C. B. of the Madras Artillery but it seems to have again been lost sight of. It is however a native of the Philippine and of some of the more northerly of the Molacca Islands. On account of its fibres it is extensively cultivated in the first of these, particularly in the provinces of Camarines, and Albay in the

MUSA TEXTILIS.

great Island of Luzon, and in several of the Bisaya Islands, a range lying south and east of it. The name abaca belongs to the Tagala and Bisaya tongues, but is not the generic name of the banana in either of them. By the Spaniards of the Philippines the plant is known under the name of arbol de canamo, or the hemp tree, from which is derived the commercial term "Manilla hemp." The natives distinguish several varieties of the Abaca, viz.

Abaca brava (the wild Abaca), called Agotai by the Bicol.

Mountain Abaca, the fibres of which only serve for making ropes, that are called Agotag and Amoquid in the Bicol language.

The Sagig of the Bisaya.

The Laquis of the Bisaya, by whom the fibres of the original Abaca are called Lamot. Rumphius states that the Malay name is Pissang-utan; that it is called in Amboyna, Kula abbal; in Ternate, Fana; and in Mindanao, Coffo, as also the cloth made from it. He distinguishes the Mindanao kind from that of Amboyna, the natives of the Philippine Islands, are said to apply the same name to the plant and its fibre. It was first called *Musa sylvestris* by Rumphius in his 'Herbarium Amboinense.' It was thought to be a variety of *M. trogloditarum* by Blanco, but called *Musa textilis* by Don Luis Nee, in a memoir which has been translated into English, and published in the 'Annals of Botany,' vol. i; where there may also be seen another memoir, which was sent in French to Sir Joseph Banks. These have been republished in the 'Transactions of the Agric. Soc. of India,' vol. viii. p. 7, together with a translation by Mr. Piddington, of Calcutta, of a notice by Father Blanco, in his 'Flora de las Filipinas.' In addition to these we have a notice in the first volume of the Trans. of the above Society, 1828, by Mr. Piddington himself, one of the gentlemen who escaped the massacre of the English at Amboyna. From these authors we learn that the Abaca is abundant in the volcanic region of the Philippine Islands, from Luzon, in the northern province of Camarines especially, to Mindanao; also in the neighbouring islands, even as far south as the Molucca Islands, that is, in Gilolo. Hence this species may be stated to extend from the Equator to nearly 20° of north latitude. It is propagated easily by the suckers which spring up at the roots of the old plant when it dies. A measure of 5,000 square yards of land will grow 1000 plants. It grows to the height of 13 or 14 feet exclu-

MUSABBAR.

sive of the leaves. The fruit is small, of a disagreeable taste, and not edible. When it is about to form, the plant is cut down, and the stem being cut open longitudinally, is found to contain a great quantity of fibres of various thickness, and usually a couple of yards in length. These are extracted, hackled after the manner of flax, and then sorted. Some of the finest are as slender as a hair of the head, and are reserved for the manufacture of cloth, while the coarser are appropriated for cordage from the smallest rope to a ship's cable. In the husbandry of the Philippines, the abaca is of more importance than cotton. Pigafetta, in his enumeration of the plants of the Philippines on their first discovery, in 1521, does not include the abaca, although he mentions cotton and the esculent banana; Dampier, in his account of Mindanao, where he resided for six months in 1686, gives an ample and accurate description of the textile banana, and the mode of extracting the thread from the trunk. "As the fruit of this tree," says he, "is of great use for food, so is the body no less serviceable to make cloths, but this I never knew till I came to this island. The ordinary people of Mindanao do wear no other cloth." After this follows the account of the process of extracting the fibres, which is well worth perusal. The Dutch have of late years introduced the culture of the abaca into the northern or volcanic peninsula of Celebes, where it seems to be indigenous, and with a fair prospect of success. There is a large exportation of abaca in the forms of raw hemp and cloth, but especially of cordage, from Manilla. Its fibre has latterly been applied to the manufacture of bonnets, tapestry, carpets, hammocks, and net work, the fibre can be bleached and dyed similarly to flax and lint.—*Crawford, Dictionary of the Eastern Archipelago* p. 1. *Bikmore's Travels*, p. 340. *Royle. Fib. Plants*, Voigt.

MUSA, TEL. A Crucible.

MUSA, AR. Moses, the prophet, to whom mahomedans apply the epithet Kalam-ullah, he who spoke with God or the mouth-piece of God, the wells of Moses, the Agun musa, are eight miles down the Red Sea from Suez on the eastern shore. The Ain (Ayun plural) is a natural spring, and differs from the Ber or Bir, a cistern to hold rain water. Jacob's well, Beer Yakoob, or Bir us Samariah is 9 ft. broad and more than 70 ft. deep. In 1855 it still had the stone over its mouth. *John*, iv.

MUSCAT, in lat. 23° 38' N. long. 58° 35' E. on the N. E. coast of Arabia. Sailing northwards from Muscat, the great chain of mountains behind the town known by the name of Jib Akdthur, or the "Green Mountains," is found to be continued on to Ras Mussundum, which forms the western promontory of the Persian Gulf, where they suddenly sink to an altitude of 400 feet, while not more than 30 miles further back there is a point 6,700 feet high. Striking, however, as the contrast is at these two points, there are two mountains within sight

MUSCAT.

of Ras Mussundum on the opposite coast which are respectively 8,800 and from 5 to 6,000 feet above the level of the sea; the first, which is Jibl Shameel, is about 70 miles northward, and the other, called Jibl Bees, about 60 miles eastward. These must be regarded as the two pillars of the straits on the eastern or Asiatic side. Towards the end of the 17th century. Muscat Arabs having driven the Persians from Oman, established their ascendancy in the Persian Gulf, and gained a footing in Zanzibar and several other parts on the African coast. In Nadirshah's reign, the Persian authority was partly re-established, but after the death of that king, Akmad bin Saeed, the Arab Governor of Sohar drove the Persians out, and he was elected Imam. He was succeeded in the Government of Muscat by his second son Syud Sultan, who usurped the rights of his elder brother. Syud Sultan was killed on 14th Nov. 1803 in battle with his enemies the Uttoobi and Joasmi. The rights of his two young sons were disputed by their uncle Syud Ghes of Sohar, who aimed at usurping the government of Muscat. During this disputed succession, Bunder Abbas and Hormuz had been seized by the shahk of Kishm, but these were recovered by the aid of the Wahabi seotarians. The weakness resulting from this disputed succession gave the Wahabees a footing in Muscat, which they have never wholly lost. This sect adopted strict and puritanical doctrines. They denied divine honours to Mahomed, abhorred and destroyed all holy tombs, abstained from the use of tobacco, and waged war against all mahomedans who did not accept their peculiar views. Their doctrines spread with amazing rapidity. In 1800 they made their first appearance in Oman. They reduced all the sea coast of the Persian Gulf from Bussora to Debye, released the chiefs of Zazeera and Sohar from allegiance to Muscat, and forced Syud Sultan to beg for a three years' truce, which they broke soon after. They would probably have conquered all Oman if they had not been stopped by the assassination of their chief. The Wahabees reached the height of their power shortly after the accession of Syud Saeed the second son of Syud Sultan, who succeeded Budr bin Halol in 1807. This chief, to whom the religious title of Imam was not conceded by the Arabs, although he is generally so styled, ruled for 60 years, during which time he cultivated a close intercourse with the British Government. In 1808, the Imam, smarting under the insults of the Wahabees, whose agents were forcibly converting his subjects in his very

MUSCAT.

capital, roused the Arab tribes in Oman to a combination against them. If Muscat had fallen under the Wahabees, the Imam would have been drawn into the general system of piracy which the Wahabees encouraged, and would have been converted from a friend into a dangerous enemy. The British Government, therefore, resolved to support him. An armament was accordingly sent towards the close of 1809, which destroyed the piratical boats at Ras-ool-khyma, Linga, and Luft, and bombarded and took Shinas. No arrangements, however, were made permanently to secure the advantages then obtained. Piracy was soon renewed, and another expedition had to be sent against the pirates in 1819, in which also the Imam co-operated. With these exceptions, till the year 1822, when a treaty was concluded for the suppression of slavery, there is nothing requiring special notice in the intercourse between the British Government and Syud Saced, who was chiefly occupied in wars with his rivals, the Joasmi, and in fruitless attempts to possess himself of the Island of Bahrein. During the later years of his rule the affairs of Syud Saced in his Asiatic dominions fell into much confusion, owing, in a considerable degree, to his prolonged residence at Zanzibar, which, in 1840 he made the permanent seat of his government, and the incapacity of the agents whom he left at Muscat, and latterly of his son Syud Thowaynee. On more than one occasion his power was saved only by the intervention of the British Government. The Wahabees forced him in 1833 to pay them a tribute of 5,000 crowns a year, and to renew the obligation in 1845, raising the tribute to 20,000 crowns 12,000 being for Muscat, and 8,000 for Sohar. About the same time also he got into trouble with Persia regarding his possessions on the Mekran coast. Besides his possessions on the Arabian and African coasts, the Imam holds the Islands of Hormuz and Kishm in the Persian Gulf, and is acknowledged as feudal lord by the Arabs on the Mekran coast between Jask and Bassein. He holds Bunder Abbas and its dependencies on rent from Persia. He also holds the ports of Gwadur and Charbar, his rights to which, according to tradition, were derived from the Khan of Khelat. In 1846 Hussein Khan, the Persian Governor of Fars, despatched a force against Bunder Abbas with the view of extorting a large sum of money from sheikh Seif bin Subhan, the Imam's deputy and governor. The Imam threatened to retaliate by destroying Bushir. It was not till a change of ministry took place on the death of Mahomed

MUSCICAPIDÆ.

Shah that redress was granted to the Imam. In 1853 the Shah of Persia resumed possession of Bunder Abbas and its dependencies; but he restored them to the Imam in 1856 on much less advantageous terms than formerly. The rent was raised from 6,000 to 16,000 tomans a year, and the Islands of Hormuz and Kishm, the Imam's hereditary possessions, were ceded to Persia. In 1854, the Imam ceded to the British Crown the Kooria Moorla Islands on the south coast of Arabia. The islands are valuable only for the guano deposits which are formed on them. Syud Saced died 1856. In 1844 he had intimated his desire to appoint his sons Syud Khalid and Syud Thowaynee as his successors in his African and Asiatic dominions respectively, and had appointed them his deputies. Syud Thowaynee accordingly succeeded to the government of Muscat on his father's death. In virtue of his succession to the chiefship of Oman, he claimed also feudal supremacy over Zanzibar and prepared to establish his claim by force of arms. The dispute was submitted to the arbitration of Lord Canning, who decided that Zanzibar should be independent of Muscat, but should pay an annual subsidy of 40,000 cowns. The present ruling family of Muscat are, as has been already noted, descended from Ahmed bin Saced, the Governor of Sohar, who, in 1730, expelled the Persians and became the first Imam of Muscat. On the death of Syud Saced, his son Syud Toorkee, who had been placed in the government of Sohar made several unsuccessful attempts to make himself independent of his elder brother Syud Thowaynee and to create a rebellion in Oman. Muscat is inhabited $\frac{1}{2}$ by mahomedans the other $\frac{1}{2}$ being Hindus, Ludianas, Sikhs, a few Jews and Parsees, Biadiah and Negroes.—*Palgrave's Treaties, Engagements and Sunnuds*, vol. vii. pp. 200, 208, 199 to 206. *Colonel Chesney, Euphrates and Tigris*, p. 41. See Imam; Kishm Island.

MUSEUM, is a word derived from a Greek term signifying a temple of the muses but as used in Great Britain and in British India, it designates an institution in which are lodged specimens of the animal, vegetable and mineral kingdoms, and those illustrative of Economic Geology. There is a Government Central Museum at Madras, a Mysore Museum, at Bangalore, formed in 1850 and 1865 by the Editor, an Imperial Museum at Calcutta, the foundation of which was

MUSEUM.

the Museum of the Bengal Asiatic Society; there is also a Museum at Bombay, one at Trevandrum and one at Vizagapatam.

The Madras Museum is free to the public, who formed it by their liberal donations to the collections; the number of visitors amounted in the year 1855, to 201,987 and in the year 1856, 542,866. These numbers will be regarded as considerable when it is mentioned that the visitors to the British Museum in 1855 were only 334,089; to the Royal Zoological Gardens in 1854 they were 407,676; and in 1855, to the New Gardens 318,818. Excepting specimens illustrative of Botany, the Government Central Museum at Madras, in 1859, in its objects, embraced Economic Geology and all the branches of Natural History; a Zoological Garden; a Public Library; and collections of coins and antiquities. The probability is that there were many students of Natural History, in the most ancient times; for, in the overwhelmed city of Pompeii, destroyed in A. D. 79, by lava, in the room of a painter, who was probably a naturalist, a large collection of shells was found, comprising a great variety of Mediterranean species, in as good a state of preservation as if they had remained for the same number of years in a museum. We know, moreover, that on the revival of science in western Europe, after the fall of the Greek or Constantinopolitan Empire, the princes and nobles formed collections of relics of art, of specimens of natural objects and other productions, constituting cabinets and museums. The discovery of busts, statues, bas-reliefs, inscriptions, and other antiquities of various kinds, led to the formation of many museums in Italy (where such subjects abound), earlier than in other countries; the Medici, Dukes of Florence, particularly signalizing themselves by the liberality and magnificence they displayed in procuring relics of antiquities, and valuable manuscripts and works of art, at a vast expense. In the 17th and 18th centuries numerous museums, some exclusively appropriated to objects relating to one science only and others of a more miscellaneous nature, were formed: not by kings and princes only but by numbers of private persons: some of whom devoted themselves to the task of collecting during a considerable part of their lives, traversing foreign countries, regardless of all toil or danger: other individuals, favored by fortune, were enabled to employ their wealth in making rich and abundant collections of curiosities, availing themselves of the services of men of science and research, who explored the world at their ex-

MUSEUM.

pense. In England, John Tradescant, collected curiosities of various kinds and his museum constituted the nucleus or foundation of the famous Ashmolean Museum at Oxford. James Petiver, a London apothecary, formed a cabinet of natural history; in Holland, Albert Seba distinguished himself as a collector of similar curiosities; and in that country, also, John Swammerdam devoted much time and labour to the study of entomology or the natural history of the insect tribes, and to the formation of a valuable museum. The Ashmolean Museum, was presented in 1836, to the University of Oxford by Elias Ashmole, an eminent herald and antiquary. It comprised originally specimens to illustrate natural history, and various artificial curiosities, especially Roman antiquities; and since its establishment numerous additions have been made to it. Among the most celebrated collectors in England during the 18th century may be reckoned Richard Mead, an eminent physician, who accumulated a valuable cabinet of coins and medals, besides other interesting objects; his rival, Dr. John Woodward, who applied himself especially, but not exclusively, to the collection and illustration of British minerals and fossil remains; and Sir Hans Sloane who, at his demise, bequeathed to Government his magnificent museum and library, in the formation of which he had expended upwards of 5 lacs of Rs. This formed the foundation of the British Museum to which has since been added the donations of many eminent and great men as well as the extensive collections which the large annual grants from the Imperial Parliament, reaching latterly to 5, 6 and 7 lacs of rupees for all purposes, have enabled the trustees to purchase. The Imperial Parliament granted £85,000 or eight and a half lacs of rupees for the expenses of the British Museum for the year 1856-57. The British Museum is not supplied with professors to instruct those desirous of information, but has a large staff of officers, whose employment it is to superintend the arrangement, preservation and exhibition of the objects of various descriptions comprised in the collection. This consists of a Library of printed books and manuscripts, objects of natural history in the animal and mineral kingdoms and a magnificent collection of sculptures, coins, drawings and engravings. Its objects, it will be observed from this, are few; nevertheless, it is the most extensive in Britain, perhaps in the world, though there are in London, Edinburgh, and Dublin, indeed in nearly every large town in Britain, museums which have attained a considerable size. On the conti-

MUSEUM.

ment of Europe, picture galleries, sculpture galleries, and collections of natural history are to be met with in all the principal towns, and in the United States of America the collections that have been made to rival those of the old world. The oldest museum in India was that of the Asiatic Society of Bengal, which includes a Museum of Natural History and a Museum of Economic Geology, of which Mr. Blyth and Mr. Piddington, for many years had been the respective curators, and under whose care great extensions were made. Dr. Oldham, the Supt. of the Geological Survey established in Calcutta, a Geological Museum, of which that hitherto in charge of Mr. Piddington, formed the nucleus. The Bombay Asiatic Society likewise possessed a museum, particularly rich in specimens of natural history, and which has been greatly indebted to Dr. Carter's efforts, and Bombay also had an Economic Museum which originated in Dr. Buist's exertions and which Lord Elphinstone took under the care of Government, placing Dr. Impey in charge. A museum existed at Singapore; one also at Agra, one at Roorkee, and one at Saugor. These institutions all originated and are nearly all of them supported by the European population of their respective communities, but it is the Madras Government to whom is due the credit of being the first of the governments of this country to establish museums as institutions of the State, and under their auspices, museums of Natural History and Economic Geology authorized six local museums, at Bellary, Cuddalore, Coimbatore, Mangalore, Ootacamund, and Rajahmundry; Lieut. Winscom formed one at Jubbalpure, and His Highness the Rajah of Travancore one. The numbers of such institutions already existing and their steady increase, everywhere, imply that they provide for some want that is generally felt; and such is, in truth, the case; for to all engaged in particular scientific pursuits, museums, whether they be their own private property or belong to the public, are essentially necessary to enable them to follow up their own investigations, and institutions of this kind afford amusement and instruction to all who take an interest in examining the works of nature and of art. On taking a leisurely survey of a well stored and well arranged museum, the thoughtful observer cannot fail to be struck with the endless variety of forms and the wonderful adaptations of means to certain appointed ends which abound in the kingdom of nature. Every single specimen, whether it be of an animal, a plant, or a

MUSEUM.

mineral, has a history to tell, full of design, abounding in instruction, and replete with beauty. All these varied forms, gathered from all parts of the earth, grouped with the method and order of a scientific mind, are, to a certain extent, exponents of the method and order of the divine Architect, who in planning the fabric and willing the existence of the meanest of His creatures, had in view certain wise and benevolent ends, which it is our duty and privilege to study, and as far as possible to understand. It may in many cases be difficult to see the uses of beings and objects on which so much care has been bestowed, and for whose propagation and preservation so many precautions have been taken; but we must bear in mind, that the use of an object does not always mean its direct application to the wants or the pleasures of man. It doubtless has its uses in the great scheme of nature, and as such the naturalist regards its economic application as of secondary importance. Hence, if rightly viewed, there is not a single object, however mean, which does not in some way or other appeal to our sympathies, excite our interest, and confirm our belief in the constant care of a protecting Providence. But visitors who saunter listlessly and purposeless in and out of a museum can never hope to experience such pleasing emotions as these, and it is to be feared that it is but too common an occurrence for many who enter institutions of this kind to quit them again with only some vague indistinct idea of having seen many curious things of which they know neither the objects nor the uses. Such profitless termination of a sight seeing is the result solely of the collections being examined without any definite purpose. By attempting too much; by trying to learn at one or even at a few visits all that a museum can teach, the mind becomes bewildered amongst the multitude of things that meet the eye, and in reality acquires no distinct knowledge of any thing it contains, for it is as impossible for a person to profit from a cursory examination of a museum, however methodically arranged it be, as to acquire a knowledge of all in the animal, vegetable and mineral kingdoms, and in the arts and manufactures (of specimens from all which museums are composed), without that close attention and prolonged study which the acquisition of every branch of knowledge demands. If visitors desire to economize their time and profit by their sight seeing they must enter such institutions with some definite object, otherwise they will return carrying with them only indistinct glimmerings of information, vague, undefined notions of the many curious

MUSEUM.

things that they had just seen, the nature, uses, or even forms of which, however, had made so little impression upon their minds that they cannot be recalled with vividness sufficient for any useful purpose. In establishing at Madras, the Government Central Museum, it was from the first intended to form a central institution connected with branch museums or repositories in the provinces, all working together and affording mutual aid by an exchange of specimens. The notification of the 14th August 1851, also mentioned that the central institution should combine the objects of a Museum of Natural History and a Museum of Economic Geology, and that the Officer in charge would occasionally print and circulate notes and extracts from publications on points connected with subjects likely to be of use. Of these objects some have been fully carried out. Amongst the periodical returns transmitted to Government, reports on woods, iron ores, marbles, sandstones, grinding materials also were published, and arrangements were made for establishing local museums in the larger towns. It consists of a Museum of Natural History, of Geographical Geology; of Economic Geology, and a public library. In the latter considerable progress has been made, and the foundation having been laid it can be rapidly increased whenever desired. The Museum of Economic Geology has aided in extending amongst the community a knowledge of the raw and manufactured products of this country; a report on the marbles of Southern India and another on this country's iron ores and iron and steel, have already appeared, there are ample materials in this collection for hundreds of such resumes. The articles in the Economic Museum have been arranged upon the plan adopted in the Grand Exhibition of 1851, under the four Sections of Raw Materials in the mineral, vegetable, and animal kingdoms; Machinery; Manufactures; and Sculptures, Models and the Plastic Art; the progress may be judged of by mentioning that this department contains about 10,000 specimens in all its sections. The Museum of Geographical Geology contains a very extensive collection of specimens of the rocks and minerals from the provinces over which the army of the Madras Presidency extends, and all so arranged that the geological features of each civil and military division can be studied separately. Museums were formed at six places, namely, Bellary, Coimbatore, Cuddalore, Mangalore, Ootacamund, Rajahmundry. All within the civil provinces of the Madras Presidency. But in addition to these, there is a

MUSEUM.

museum which has, for some years past, been in existence at Singapore; another was established at Jubbulpore, and a third at Travandrum.

The Visitors to the Govt. Central Museum, Madras, during the following years were,

MUSHK WALL.

An institution was commenced in Calcutta, in 1866, as a National Museum for India, of which the extensive and valuable collections of the Bengal Asiatic Society formed the nucleus of this Museum. It has rapidly increased since 1866 in the Natural History department and a two storied building to cost about £100,000 is to be erected for its reception. The building faces the Maidan and is of great extent. Dr. Anderson, who was in charge of it sent collectors out to various parts of India, and the neighbouring countries, in 1870; he had a man in Persia, another in Yarkand, and a third in Nepal, one in the hilly region of eastern Assam, and another in Arakan. Collectors for this Museum accompanied the Abyssinian Expedition, Dr. Anderson was naturalist to the Yunan Expedition with two collectors attached to him. The present officers are the Curator, the Assistant Curator and the Librarian who is also Assistant Secretary. It is the intention of Government to form a Library on a large scale in connection with the Museum but in the meantime and until the new building is completed, it is confined almost exclusively to Natural History.

MUSHAEKH, ARAB. A patriarch or devout man, a religious teacher.

MUSHARI, See Kummaler.

MUSHED, the capital of Khorasan. It was for some years the residence of the court of Nadir Shah—*Malcolm's History of Persia*, vol. ii. p. 216. See Kuzzilbash, Kafir.

MUSHINA, also Musina, BENG. *Linum usitatissimum*, Linn.

MUSHI-RANG, HIND. rat color.

MUSHK, AR. HIND. PERS. Musk.

MUSHKAN, TEL. *Bignonia*, sp.

MUSHK-DANA, HIND. or Hubb-ool-mooshk. AR. *Abelmoschus moschatus* *March?*

MUSHKI, a western division of Beluchistan. Mushki has several towns and castles, and is occupied by the Mehmasani, the Nonshorwani and Mirwari tribes. The Mirwari Brahui are located in Mushk, Jhow and Kolwah. The Brahui entered from the west and point to Khozdar as the capital prior to occupying Kalat. See Kelat.

MUSHKI also Mushkan, HIND. a scented kind of rice.

MUSHKIARA, HIND. *Sambucus obulus*.

MUSHK-KAFUR, HIND. *Laurus camphora*.

MUSHK-NAFA, HIND. the musk bag of the musk deer: *nafa-i-Khatai*, Chinese musk, the finest quality.

MUSHK TARA MUSHI, HIND. *Mentha incana*.

MUSHK WALLI, HIND. *Valeriana Wallichii*, bed-i-mushk, HIND. is *Salix caprea*

MUSHROOM.

faranj mushk, Hind. is *Calamintha umbrosa*, also *Ocimum basilicum*.

MUSHOOD WAZIRI, a tribe of the Waziri Afghans, near the Khyber pass.

MUSHRIFF, ARAB. PERS. HIND. A cashier.

MUSHRIK, AR. One who gives a companion to the Almighty; a term used by Mohamed in the Koran to designate Christians.

MUSHROO, HIND. stuff of silk and cotton. Satins, the back or warp of which consists of cotton.

MUSHROOM. The Agaricaceae, the Mushroom Tribe of plants, the Fungaceae of Lindley, comprise mushrooms, puff-balls and Mildews. They grow on the earth, and on decayed animal and vegetable substances, scarcely ever on living bodies of either kingdom, in which respect they differ from lichens which commonly grow on the living bark of trees. Dr. Royle's collections in the Himalaya, amounted to about forty specimens. Some of the fungi are used as food, others are poisonous, others are parasitic and destructive to the plants on which they grow. The *Agaricus campestris*, the common mushroom, the various species of the *Helvella* or morel and of the tuber or truffle are all useful as food, but there is great difficulty experienced in distinguishing the poisonous from the edible kinds and only such should be eaten as are raised in gardens in mushroom beds. The *Koodrati* mushroom is found throughout the Dekhan. Mushrooms are often seen in the Tenasserim bazaar, and the Karens have names for sixty-four different species of mushrooms and the allied fungi. They distinguish the edible from the poisonous kinds, they say, by touching them with the lime that they eat with the betel. If the fungus turned red when touched, it is regarded as poisonous. But they are so careless or ignorant, that sickness and death often ensue after eating them. A new mushroom collected from the stumps of trees *Agaricus* (*Pleurotus*) *subocreatus* is a dendrophytal species, drying readily, is employed in the Straits settlements as an article of food and is nearly allied to the British *Agaricus ulmarius*, from which it is separated by the volva, remains of which may be traced at the base of the stem. Mr. Powell says, there are three kinds of edible fungi in the Punjab, viz. The mushroom (*Agaricus campestris* the Samarak or Samarugh of the Punjab) also the morel *Morchella esculenta*, (*Phallus esculentus*) and the truffle *Tuber cibarium*, or allied species, called khumba, and khambur. The *Agaricus campestris* mush-

MUSIC.

room is usually called "pad bahera;" and the morel, "guchi," or "kama guchu." Dr. Henderson mentions that in Shahpur and other districts, where there is "kalr" in the soil, the morel and mushroom are both abundant, the former in August and September, the latter in the end of the cold season, after heavy falls of rain. Mohamedans eat only the morel, and consider the mushroom as "haram" or unlawful food. Natives say that every mushroom having a pleasant smell and taste is wholesome. In the Jhang district, an underground morel, called "phaphor," is found in fields of Jawar (*Holcus sorghum*), and Edgeworth, in the "Flofula Mallica," mentions an esculent morel, which he calls "banphal, literally wild fruit." It is said that the morel and agaricus have both narcotic effects when eaten. Quantities of the morel are brought from Kashmir to Amritsar. The khumba, or khambur of Mazaffargarh, is of a pure white color, with a powdery surface and destitute of gills; it is very common in the rains, and is much esteemed as an article of food. Fried in the ordinary way they are equal in flavor to English mushrooms. They are called khumba, and when very large khambur. The Morel (*Morchella esculenta*), called "kama also kachu," are imported into India from Kashmir.—*Royle Ill. Himalayan Botany*, 440. *Riddell. Dr. Mason's Tenasserim*, Dr. O'Shaughnessy, *Beng. Disp.* Dr. Honingberger, p. 223. See *Agaricus*; *Fungus*.

MUSHTARI, or Mushtri. AR. the planet. Jupiter.

MUSHTEE, also Mushtighanga musidi, TEL. *Strychnos nux vomica*.

MUSHTIGAR, KARN. A tribe in Mysore calling themselves Kshatriya and following agriculture but in some respects resembling the Jatti or boxers. This seems a misprint for Kushtigar, a wrestler.

MUSIC. An account of the state of musical science amongst the Hindus of early ages, and a comparison between it and that of Europe, is yet a desideratum in Oriental literature. From what we already know of the science, it appears to have attained a theoretical precision yet unknown to Europe, at a period when even Greece was little removed from barbarism. The inspirations of the bards of the first ages were all set to music; and the children of the most powerful potentates sang the episodes of the great epics of Valmiki and Vyasa. In music, there are two things which should be very carefully distinguished,—the time, and the words or sentences

MUSIC.

which are adjusted to the time; they are respectively called in Sanskrit *awara* and *sahittya*. For instance, we may compose a verse and adapt it to a certain tune and sing it. When we understand the sense of the verse, there is one sort of pleasure, and when we hear the song, there is another, independent of the former. Though these two sorts of pleasure intensify each other in combination, they are not identical, and some persons confound one of these with the other. In India the hindoo who attentively listens to a Thangam pattu passes for one possessing a fine musical taste, while in reality, he takes no delight in the tune, but revels in the obscene pictures which that vicious ballad recalls to his mind. Such a one as this, when he attends a party where there are able musicians, would ask for a hriti of Muttuvirayi, a vulgar ballad; and when the musician declines, he will burst into a vociferous criticism against him and say that the fellow knows no music. Some people though they take delight in music and are daily in the habit of frequenting musical parties, erroneously suppose that each one of twenty-four steps of the Veena or lyre, will utter some letter such as ha, hha, ga, gha, &c! Here are two things confounded, viz., the tune and the letter; there are such absurd hindooos as will say "How pleasant it will be if a musician sings Kalyani ragam on a mritthanga or drum" or "if a dancing girl dance to an alapana or suruti." While the reading of the vedas, puranas and other religious books was monopolized by the Vydika religious men and poetry, rhetoric and kindred branches of learning became the hobby of the Lokika or men of the world, music, left without any place and protection, took refuge in brothels. The religious brahmins went so far as to hurl their thunders against those who practised it and said "Gayata na thayam" (that we should not give them any thing). Much attention has not, however, been paid to this injunction and it has often been violated. Europeans have a very low opinion of native music, not certainly founded upon good grounds. Music delights us in two ways, viz., by harmony and melody. The former consists in the agreeableness of two or more sounds uttered at the same time, while the latter is seen in the succession of many sounds. If you take a veena and tightening the strings up to their proper pitch, arrange the sruti properly and touch all of them at once, you have harmony. Your veena may be accompanied by a fiddle having the same sruti, the harmony will be still more pleasing. But if in your veena you touch some of the

MUSICAL INSTRUMENTS.

steps with your finger in succession, you have melody. For instance touch the second, third, fifth, seventh, ninth, tenth, and twelfth steps, you have a melodious succession of sounds. This succession is called *biravi* by the hindoos. In Sanskrit, harmony is termed *sruti* and melody *raga*. The natives of India know both harmony and melody and are distinguished for their skill in both. The vocal music of Europeans is generally thought by hindus to be unattractive. But when ladies sing, their naturally sweet voices are deemed to make up a little for the defects of their music. Hindoo music is vaster and more various than that of Europe as may be exemplified in the following manner. Take a *veena* or guitar, and press the string in one of the steps, and move it to and fro. We may hear a gradual ascension and descension from one note to another. Thus we produce an intervening note between two notes. A variety of notes is thus produced to make the melody more rich.

MUSICAL INSTRUMENTS.

The mahomedans of India have the following wind instruments, viz.,

Zuleeree.

Puttee, a leaf of the *Holcus saccharatus*, *Lin.* held between the lips and sounded.

Moorchung, or Jew's harp.

Shuhnæe, a kind of clarinet, a cubit long, and having a leaf mouth-piece; commonly called *Soornæe*.

Soor, a bass or drone to the *shuhnæe*.

Algoa, a small flageolet, a span long.

Nagaysur.

Poongee. Of this there are two varieties, one made of leather and sometimes accompanies the *kunchnee-ka-tæfa*, the other of pumpkin, usually played upon by jugglers and snake dancers, &c.

Qurna, a straight or carved horn, twelve feet long.

Toorree, or *Toortoorree*, commonly denominated by Europeans colliery horn, consists of three pieces fixed into one another, of a semi-circular shape.

Banka, is the *Toorree*, with the upper piece turned from the performer, forming it into the shape of the letter S.

Banslee, or flute.

Sunkh, the Chank or conch shell. It is the trumpet of the hindoo temples frequently used by devotees, also as an accompaniment to the *tumkæe*. Sometimes they play trios and quartettes on the chank shells alone.

Nursinga, a sort of horn.

The following are the drums, guitars, cymbals, castanets, &c., &c., of the mahomedans, viz.,

MUSICAL INSTRUMENTS.

Chitkæe, or snapping the fingers.

Tælee, or clapping the hands.

Khunjree, a sort of small tambourin, played upon with the fingers.

Duff or *Duffra*, the tambour de basque; "tympanum," according to Gentius, *Sadi Resar. Polit.* p. 303. A sort of bass tambourin, played upon with a stick.

Dæera, the largest variety of tambourin, being from a foot and a half to two feet in diameter, played upon with a stick.

Dhol, a larger drum than any of the following, both sides covered with leather, and played upon with the hands.

D'holuk, or *Dholkee*, smaller than the preceding, and only one side covered with leather.

Meerdung, a kind of drum which is an accompaniment to the *kunchnee ka tæfa*.

Pukhawaj, a kind of drum, a timbrel.

Tabla, a couple of drums, played upon at the same time, one with each hand.

Nurga.

Nugara, or a kettle drum.

Ghurreeal, a plate of brass for beating time, a brass gong.

Tukkoray, or *Zayrbum*, are small kettle drums; one is called *zayr*, the other *bum*.

Dunka, or a bass kettle drum, middle size, between the *nugara* and *tukkoray*.

Tasa, or *Tasha-murfa*, a drum of a semi-circular shape, played upon with two sticks, and invariably accompanied by the *murfa*.

Murfa, a drum like a *d'hol*, covered at both ends with leather, but played upon only on one side with a stick.

Tubal, an enormously large variety of drum, used in the field of battle.

Tumkæe, a small circular brass plate, played on by striking with a piece of wood, having a knob at the end.

Dhubboos, consists of a rod of iron about a foot long, with a knob at one end and a sharp point at the other, having from fifty to a hundred hollow rings, which when shook rattle against one another: used by fugers, who wield it about, striking their abdomen of a sudden with the sharp point.

G'hurra, or empty earthen vessels, or water pots, played upon with the hand.

Si-tara three wires, or *Ek Tara*, when with one steel wire, called by the latter name: sometimes it has nine or eleven steel wires; but generally three, whence its name, from three, and string or wire.

Tumboora, a sort of seetar, (guitar), having catgut strings instead of wire.

Sarung, or *Sarungee*, a musical instrument like a fiddle, played upon with a bow.

Rubah, a kind of violin a rebeck.

MUSICAL INSTRUMENTS.

Been, or Vina, a sort of seetar but having two dried hollow pumpkins (*Cucurbita melopepo*, Willd.) fixed to the end of it, with five or seven steel strings; described by Sir William Jones in the *Asiat. Researches*.

Keenggree, similar to the preceding, but having three or four pumpkins, and only two steel strings generally used by hindoos.

Qanoon, a species of dulcimer, or harp.

Urugan, a kind of organ.

Ragmala.

Chukara, a kind of violin.

Thalee, a flat earthen dish on which they rub and rattle a stick with both hands.

Theekree, two bits of sticks or fragments of earthen vessels used as castanets.

Doroo, a small double headed hand drum.

Surod, a kind of guitar (or seetar), having catgut or silk strings.

Duppra.

Munjeera, or Jhanjh, a kind of small cymbals in the shape of cups, struck against each other, and accompanying most bands.

Tal, cymbals, used by devotees, and frequently as an accompaniment to the tafia.

Ghugree, one or two hollow rings with pebbles in them, worn on one or both thumbs, and rattled.

Goonghroo, little bells fastened to a string, which is wound round the wrists and ankles, and which jingle at every motion of the limbs.

Saz.

Seekhan, a piece of iron about a cubit long, with which fingers pierce their necks and cheeks. Also;—An Arab musical instrument, used by the Arabians who frequent the Malabar Coast.

The following are the musical instruments played as accompaniments to the performances of the dancing girls.

Drums.—Of these there are two, a large oval shaped one termed a d'hol, and a smaller one of the same shape and make, called a malum moorathungum or mathalum. These are hollow wooden cylinders, large in the centre, and narrowed at either extremity, and covered by parchment at both ends.

Thoothe or santoothe, a wind bag, somewhat like a bagpipe, this comprises the entire skin of a sheep or goat, freed of hair and having all the openings closed, excepting two pipes of reed, one of which is inserted in the neck, and the other, at one of the extremities, one to blow with, and the other through which the air issues, producing a low moaning sound.

Thalum. Two pairs of cymbals, (large and small) termed peria and chinna, thalum.

A piccolo, termed poolan kushul.

A small flageolet, called mogovoni.

MUSICAL INSTRUMENTS.

A large flageolet, called peria walum mogovoni.

In addition, they sometimes have a clarinet, violin, tambourine, and guitar, but these are innovations of late introduction. In the performance of the hindoo dancing girls in the two dances termed avaneum and kancheeno naeteum, their movements are combined with great agility, ease, and gracefulness, and with their pimple steps, the turning and twisting of their hands, eyes, face, features and trunk agree, whilst they beat time with their feet. The feet generally placed flat as they seldom dance on their toes—the movements and position combine something of the waltz and Spanish cachucha—they advance, retire, whirl around, drop down and rise again with ease and rapidity, whilst the several movements are kept in order with the twirling and twisting of their hands, features, trunk, &c. Some portions of the step resemble the hornpipe and jig, whilst they hop and dance from one leg to another, keeping time, now turning, now whirling, now capering, and now drooping, performing a coquettish pantomime with their antics, then affecting coyness, and dancing away from the assembly, by suddenly turning away as if careless of their allurements, but returning to the attack with greater vigor and increased blandishments. It is indeed, surprising to witness their feats of strength and bodily powers of endurance, for notwithstanding their frail make and delicate appearance, the amount of fatigue they endure, dancing as they do from nightfall to early hours of the morning is astonishing. Their dancing is perfection, and the bodily fatigue they must undergo, from the attitudes and positions they combine in their dances, must be great. In what is called the "Sterria Cothoo" athletic feats are performed, resting their hands on the ground and flinging their feet in the air with great rapidity and thus twirling round and round, successively performing various somersaults, lying full length on the ground with their hands and feet resting, contorting; twirling, and twisting their bodies in various ways, or whilst resting on the hands and legs with their backs to the ground and their chest and abdomen turned upwards, drawing the hands and feet as close together as possible; whilst their bodies are thus arched they with their mouths pick up rupees from the ground. In this arched position beating time with their hands and feet, they work round and round in a circle. During their performance they join their attendants in the songs that are sung and regulate the various movements of their bodies to the expression given vent to in the song.

MUSICAL INSTRUMENTS.

Modiye doocooroothoo.—In this dance the word "mod" is a term used to designate a craft or enchantment practised by a conjuror who places or hides money or other valuables in a certain place, and often in the presence of his opponent, with the view of testing his ability, and challenges him to remove it, which the opponent endeavours to do by playing on a pipe termed "maked," and if he be not equally skilled, he is struck to the ground in a mysterious manner sick and ill, frequently bleeding from the nose and mouth profusely. The dance is in imitation of this by the girl playing on a maked, dancing at the same time and throwing herself on the ground—the right leg is stretched out at full length, forming a perfect angle with her body out on one side; on the other, the left leg doubled under the knee is stretched out in like manner on the opposite side, producing a most singular appearance, and as if there were no joint in the hips.

Colu Autum, or the stick dance, is formed by a number of girls of the same age, size, and dress, numbering from twelve to twenty-four, or more, each having two sticks, one in each hand, about eighteen inches long, well turned, and painted with circular stripes of yellow, green and red. Either to the roof or across a piece of wood raised in support for the purpose, a stout skein of thread in different colours is suspended, and having as many strands as there are girls, the free ends of the strands are tied to the ends of the painted sticks each hold; the dance begins with the usual song and accompaniment of music, when each girl striking her sticks dances a kind of jig and hops from place to place exchanging places with each other. This is done with such order and regularity that the several strands are plaited with the utmost regularity into a stout cord or tapo of many colours, according to the design. At a sign from the conductor the same is undone, with equal order and regularity, the girls dancing and exchanging places with each other without a single mistake or false step, either in the plaiting or unplaiting of the strands of thread. The readiness, grace, and ease with which the several movements are effected are worthy of admiration. At some places on festive occasions, during the peregrinations of the hindoo idol around the town in procession, these girls perform the stick dance on a platform, which is carried and precedes the idol. More frequently these and other dances are performed on foot in front and at some distance from the procession, which stands still at a certain distance to allow of its being properly carried out.

MUSICAL INSTRUMENTS.

Of the Burmese musical instruments, the chief in size and power, is called *Patahsing*, and may be styled a *Drum Harmonicon*. It consists of a circular tub-like frame, about thirty inches high and four feet six inches in diameter. This frame is formed of separate wooden staves fancifully carved, and fitting by tennon into a hoop which keeps them in place. Round the interior of the frame are suspended vertically some eighteen or twenty drums, or tom-toms, graduated in tone, and in size from about 2½ inches diameter up to ten. In tuning, the tone of each drum is modified as required, by the application of a little moist clay with a sweep of the thumb, in the centre of the parchment. The whole system then forms a sort of harmonicon, on which the performer, squatted in the middle, plays with the natural plectra of his fingers and palms,—and with great dexterity and musical effect.

Another somewhat similar instrument has a frame about four feet in diameter, and fourteen inches high. The player sits within the inner circle and strikes the gongs with small drum-sticks. This instrument is one of singular sweetness and melody.

The harp of Burmah is held across the lap when played, the curved horn being to the left, and the right hand passed round and over the strings instead of being kept upright like the Welsh harp. Tasselled cords attached to the ends of the strings and twisted round the curved head, serve for tuning. This is done by pushing them up or down, so that the curvature of the head increases or diminishes the tension. These cords are at the same time ornamental appendages to the harp. This harp is a pleasing instrument by itself, but it is usually only an accompaniment to unmelodious chants of intolerable proximity.

The bamboo Harmonicon or staccato is a musical instrument used throughout Burmah and the Eastern Archipelago. In Java they have a number of such instruments, made in wood and metal, and only slightly differing from one another, though distinguished by different names. In that of Burmah, eighteen to twenty slips of bamboo, about an inch and a half broad and of graduated length, are strung upon a double string, and suspended in a catenary over the mouth of a trough-like sounding box. The roundish side of the bamboo is uppermost, and whilst the extremities of the slips are left to their original thickness, the middle part of each is thinned and hollowed out below. The tuning is accomplished partly by the regulating of this thinning of the middle part. The scale so formed is played with one or two drum-

MUSICANUS

sticks, and the instrument is one of very mellow and pleasing tone. Though the materials are of no value, a good old Harmonicon is prized by the owner, like a good old Cremona, and he can rarely be induced to part with it.

The musical instruments of Java are the Bonang, Kromo and Gambang.—*Tod's Rajasthan*, vol. i. p. 539. *Native Public Opinion*. Herklot. *Yule's Mission*.

MUSICAL-FISH, or Drum-fish, a sea-fish near the Pearl river near Macao. Every evening, they assemble around a ship and continue their musical humming till about mid-night. The noise rises and falls or suddenly ceases at times as they quit the ship in search of food.—*Adams*, p. 63.

MUSICANI, an ancient people of upper Sindh, whose capital was Alor.

MUSICANUS, a chief mentioned in the account of the Voyage of Nearchus, Pottinger finds a similarity between Musicanus and Moo-Selwan, the names of two contiguous districts in Sind, and usually connected in utterance. They lie exactly where we are told the Greeks found that chief's territories. From the territory of the Sogdi or Sodrae, Alexander continued his voyage down the Indus to the capital of a king named Musikanus, according to Strabo, Diodorus, and Arrian or of a people named Musicani, according to Curtius. These statements can only apply to the rich and powerful kingdom of Upper Sindh, of which Alor is known to have been the capital for many ages. There is however nothing to guide us but the general description that the kingdom of Musikanus was "the richest and most populous throughout all India," and that the territory of Alor was rich and fertile, is known from the early Arab geographers, who are unanimous in its praise. The ruins of Alor are situated to the south of a gap in the low range of limestone-hills which stretches from Bukkur or Bhakar towards the south for about 20 miles, until it is lost in the broad belt of sand-hills which bound the Nara, or old bed of the Indus on the west. Through this gap a branch of the Indus once flowed, which protected the city on the north-west. To the north-east it was covered by a second branch, of the river, which flowed nearly at right angles to the other, at a distance of three miles. At the accession of raja Dahir, in A. D. 680, the latter was probably the main stream of the Indus which had been gradually working to the westward from its original bed in the old Nara. According to the native histories, the final change was hastened by the excavation of a channel through the northern end of

MUSK.

the range of hills between Bhakar and Rori. The correct name of Alor is not quite certain. The common pronunciation at present is Aror, but General Cunningham thinks it probable that the original name was Rora, and that the initial vowel was derived from the Arabic prefix Al, as it is written Alror in Biladuri, Edrisi, and other Arab authors. The city of Musikanus was evidently a position of some consequence as Arrian relates that Alexander "ordered Kraterus to build a castle in the city, and himself tarried there to see it finished. *Pottinger, Travels in Beloochistan, Asiatic Researches*, vol. 15 p. 14. *Cunningham Ancient Geography of India*, pp. 256, 259. See Kabul.

MUSINA, a little mammal of Japan, very like a racoon.

MUSINA, or musnee. **BENG. HIND.** Linn. usitatissimu.

MUSIRIS. A port known to the Greeks on the coast of Malabar, in all probability, Mangalore. It is alluded to in the Periplus of the Erythrean Sea (supposed to have been written by Arrian) to whom we are indebted for the earliest mention of the peninsula of the Dekhan, and we are informed of Hippalus, the commander of a vessel in the Indian trade, having the hardihood to stretch out to sea, from the mouth of the Arabian gulf and practically test the more theoretical observations of his predecessors: this experiment was successful, and he found himself carried by the south-west monsoon to Musiris. This bold adventure, gained for him the honour of having his name attached to the wind by which he was enabled to perform this novel voyage.—*Ind. in 15th Century*.

MUSJID, AR. a mosque. Musjid-ul-Haram, the sacred or inviolable temple, i. e., Kaaba. The English letter j, amongst the people of Egypt and Turkey, has the hard sound of g, hence musjid is pronounced musgid, from which is the English word mosque.

Musk is a secretion in the preputial follicles of the musk deer, the *Moschus moschiferus*, and is sometimes adulterated with dried blood or catechu. If the former

MUSK.

be present, agitation with distilled water will often form a solution, coagulated by heat. The latter is detected by adding a solution of muriate of iron to the water in which the musk was diffused: a deep black colour is produced if catechu be present. Globules of lead are often fraudulently introduced into the sacs; the best test is the strength of the alcoholic solution. The Musk deer is found in the Himalaya, Siberia, Tonquin, and Cochiu-China. A substance analogous to musk (in Hyracium) is brought to Bombay by merchants from Zanzibar. True musk is only found in the follicle of the musk deer, in the rutting season and in the early winter. Good musk is in irregular, unctuous, light, dry, reddish-black, or dark purple grains, concreted in a slightly oval bag, about $1\frac{1}{2}$ inches in diameter, hairy on one side and not on the other; they weigh from 200 to 250 grains a piece. The small dark bags with the grayish hairs arranged evenly around the centre are the best. In the living animal, the musk has the consistence of honey, is of a brownish-red color, and has a strong odour. When dry, the musk is almost solid, granular, and of a dark-brown color. It feels unctuous and fatty, has a bitter aromatic taste and its smell is powerful. Each sac does not contain more than 370 grains in an adult, and 123 in an old animal. Two kinds of musk are known in commerce, the Tonquin, or Chinese, which is the best; and the Habardur, or Russian. The musk that reaches Britain is imported from China in chests of from 60 to 100 ounces each. An inferior kind, of hill produce is imported from Bengal. There is also a Siberian or Russian musk. The China musk bags are always observed to have been opened and sewn up again, and it is probable that adulteration is largely practised: the blood of the animal is often mixed with the musk. The Simla musk balls, which are presented as complimentary nazars by hill chiefs, are an inferior kind, and do not command anything like the price of the genuine Thibet balls. About 100 musk bags are imported from Changthan via Yarkand of which about 40 go to Yarkand: the rest go to Kashmir and Jammu, and are taken by Yarkandi pilgrims to Mecca for sale in India or other Asiatic countries: they are produced in the north-west of Rodokh and Nepal, and their value, at Le, 7 to 15 Rs.; but all supply from that quarter has long ceased. In 1857, the import of musk into England was 10,728 ounces. The pod is obtained from the male, the largest are the size of about a pullet's egg and worth about 25

MUSK-DEER.

shillings. Edrisi, the Moorish geographer, writing in the twelfth century, enumerates musk as one of the productions then exported from Ceylon; but this must have been the civet of the glossy genet, the civet cat of Europeans, which is common in the northern province, where the Tamil people confine it in cages for the sake of its musk, which they collect from the wooden bars on which it rubs itself. The musk bag of the musk deer consists of a sac, which is only present in the male; it is placed on the median line of the abdomen, between the navel and the orifice of the prepuce and near the latter. The sac is of a rounded oval form, flat on its superior and, adherent surface, but convex and covered with hair on its inferior or free surface. In adults the sac is from two to three inches long, and 7 to 10 lines in depth. The envelope of the sac consists of three separate membranes. These small bodies are glands for the secretion of the musk. Toward the middle of the external surface of the sac is a short canal, which passes obliquely, and has its internal opening marked by a number of converging hairs.—O'Shaughnessy.

MUSK-DEER.

<i>Moschus moschiferus</i>	Rouz,	Tib.
<i>Long Labu or Lay,</i>	Tib.	

The musk-deer, is about the size of a young roebuck six months old. The color of the skin is blackish with a mixture of yellow and reddish brown. The tail has a heart-shaped space around it, naked in the male and always moistened with a strong smelling secretion, the females, during the whole of life, and the males up to two years of age, have the tail covered with hair on its upper part, and with wool on its under part: the animal has no horns. It is timid and nocturnal in its habits, very rapid in its course; it has a leaping motion, something like that of the hare; it leads a solitary life, except in autumn; it feeds upon the leaves, bark, and roots of trees; its flesh is good to eat. The male animal produces the musk; it is a native of Eastern Asia, between the 30° and 60° north latitude. It is found in the steppes of the Altai on the Irtysh river, extending eastward as far as the river Yenosei and lake Baikal.

The musk-deer is rather more than three feet long, and stands nearly two feet high at the shoulder; but they vary considerably in size, those found in thick shady woods being invariably larger than those on rocky open ground. The head is small, the ears long and erect. The male has a tusk depending from each upper jaw, which, in a full-grown animal is about three inches long, the thickness of a goose-quill; sharp pointed, and curving

MUSK-DEER.

slightly backwards. The general colour is a dark speckled brownish gray, deepening to nearly black on the hind quarters, where it is edged down the inside of the thighs with reddish yellow. The throat, belly, and legs, are of a lighter gray. Legs long and slender; toes long and pointed; the hind heels are long, and as well as the toes rest on the ground. The fur is composed of thick spiral hairs, not unlike miniature porcupine quills; they are very brittle, breaking with a slight pull, and so thickly set, that numbers may be pulled out without altering the outward appearance of the fur. It is white from the roots to nearly the tips, where it gradually becomes dark. The fur is much longer and thicker on the hind parts than on the fore, and gives the animal the appearance of being much larger in the hind quarters, than the shoulder. The tail which is not seen unless the fur is parted, is an inch long, and about the thickness of a thumb; in females and young animals it is covered with hair; but in adult males is quite naked, except a slight tuft at the end; and often covered, as well as all the parts near it, with a yellowish waxy substance. The musk, which is much better known than the deer itself, is only found in adult males; the females have none, neither has any portion of their bodies the slightest odour of musk. The dung of the males smells nearly as strong as musk, but singularly enough neither in the contents of the stomach, nor bladder, nor in any other part of the body, is there any perceptible scent of musk. The pod, which is placed near the navel, and between the flesh and the skin, is composed of several layers of thin skin, in which the musk is confined, and has much the appearance of the craw or stomach of a partridge, or other small gallinaceous bird, when full of food. There is an orifice outwards through the skin, into which, by a slight pressure, the finger will pass, but it has no connection whatever with the body. It is probable that musk is at times discharged through this orifice, as the pod is often found not half full, and sometimes even nearly void. The musk itself is in grains, from the size of a small bullet to a small shot, of irregular shape, but generally round or oblong, together with more or less in coarse powder. When fresh it is of a dark reddish brown colour; but when taken out of the pod and kept for any length of time, becomes nearly black. In autumn and winter the grains are firm, hard, and nearly dry; but in summer they become damp and soft. The musk-deer may be found upon every hill of an elevation above 8,000 feet, which is clothed with

MUSK-RATS' TAILS.

forest. On the lower ranges it is comparatively a rare animal. Exclusively a forest animal, it inhabits all kinds of forest indiscriminately, from the oaks of the lower hills to the stunted bushes near the limits of vegetation the preference seems to be given to the birch forests, where the underwood consists chiefly of the white rhododendron and juniper.

The annual exports of musk from India were as under:

1857-58..... £ 1,956|1859-60..... £ 1,792
1858-59..... „ 3,236|1860-61..... „ 3,671

Nearly all of it was from Bengal, none from Madras, and in these four years only to the value of £132 from Bombay. A white musk deer is said to have been brought from Banka, of the size of a kitten, white all over, and apparently full grown.—*Markham's Shooting in the Himalayas*, p. 85-90. *O'Shaughnessy's Bengal Dispensary*; *O'Shaughnessy's Bengal Pharmacopœia*. *Smith's Chinese Materia Medica*, p. 153. *Royle's Mat. A fine cotton fabric, extensively manufactured in India, in Europe and America. There are a great variety of kinds and qualities, as, book-muslin, cambric-muslin, mull-muslin, &c. Formerly all muslins were made in British India, and Dacca in Bengal and Arnee in Chingleput were celebrated; Dacca, especially, was formerly celebrated for "its webs of woven wind." The Dacca muslin manufacture once employed thousands of hands, but towards the middle of the 19th Century it was quite at an end, so that it was with great difficulty that the specimens of the fabrics sent to the Great Exhibition of 1851, were procured. The kind of cotton (which is very short in the staple) employed, was hardly grown, and scarcely a loom then existed which was fit for the the finest fabrics. The Dacca

MUSLIN.

jewellers still excel in gold and silver filigree. At the Madras Exhibition of 1855, the Cambric muslin bleached and the Isree muslin exhibited by Veerabomma Kristnama Chetty were of a very superior quality and the Jury considered the manufacturer entitled to a reward of a 2nd class medal. The most celebrated of Indian muslins was that of Dacca, made from cotton grown in the vicinity, the thread from which does not swell. Chicacole, and Upada, a few miles north of Cocanada, formerly produced fine muslins and, in 1862, a strong muslin, generally checked, is procurable at Chicacole, at 3 to 6 rupees per piece of 8 yards, or made to order of very good, quality at 11 rupees the piece. The famous Arnee muslins, of which Book muslins are an imitation are prepared at Arnee in the Chingleput district: they sell according to quality. At the 1851 and 1862 Exhibitions, Dacca muslins stood successful in comparison with those of Europe, and in the Industrial museum at London is a piece 20 yards \times 1 yard, weighing only $7\frac{1}{2}$ oz. At that of 1862, an excellent specimen of Dacca manufacture was superior to any shown in 1851, the best specimen on that occasion proving to be of No. 357s yarn and that of 1862 38s. As then, however, some machine made muslin in the Exhibition was superior in point of fineness, according to the mode of computation adopted; there were exhibited also,

Charkana muslin.	Ab-rowan
Junglekhassa.	Sircar-i-Ali
Striped muslin, or Dooreah.	Maimi Khas
Spotted muslin, or Bootee.	Naynrook
Allabully muslin.	Figured muslin.
Red spotted muslin, or Boote	Chunderkooma Mulmul,
Jamdanee	Kurnool muslin, 1st quality,
	Maderpak muslin, from North Arcot.

The thread used in weaving muslin of the finest kind is spun from a peculiar kind of cotton, known by the vernacular name of 'Pu Parthi.' The weavers state that they purchase this thread ready spun from a colony of pariahs, who have settled in the neighbourhood, and who have the speciality of its preparation. It is not stated wherein this peculiarity of manufacture chiefly consists, as all that the local report says on this head is, that after the cotton is carefully cleaned and picked it is laid by in cloth bundles for two or three years, when it is rolled in plantain bark and then wound off. The weavers of the Philippines succeed in reducing the harsh filaments of the Abaca palm-tree, to such a degree of fineness, that they afterwards convert them into textures equal to the best muslins of Bengal.

MUSKITO.

The manufacture of the exceedingly fine Dacca muslins is slowly dying out. There is now no demand for those of the finest quality—the ab-rowan or running-water and shubnam or night-dew. The Native nobility of India do not patronize the finest sort, and there is no market for them elsewhere. In 1862, there was only a single family of weavers in Dacca who can manufacture the very finest quality; and it takes them six months to make up one piece, but even for this piece they get no orders. Besides, the particular kind of cotton, kapas, supposed to be finer than the finest new Orleans staple, from which alone the thread was spun, is now never grown. The principal varieties of plain muslins manufactured at Dacca, are Mnlmul Khas, Abrawan, Shab-nam, Khasa, Jhna Circar Ali, Tan-zeb, Alabullee, Nynsook, Buddun Khas, Turandam, Surbutee and Surbund—names which denote fineness, beauty or transparency of texture, or the uses to which they are put. *Hooker Him. Jour.* vol. ii. p. 254. *Rhade, MSS. M. E. J. R. Walton's state* p. 55-6. *Cut. Ezh.* 1862.

MUSLI. HIND. A term by which the roots of several plants are designated, Musli Sufed *Asparagus filicinus*, Musli Siyah. *Aneilema tuberosa*. See Moosli.

MUSMUSA.—*Bryonia scabra*.

MUSNUD, ARAB. HIND. The throne of a mahomedan prince of India.

MUSOOR, BENG. Hairy tare, *Ervum hirsutum*.

MUSQUASH. A species of *Ondatra* the musk-rat, a diminutive species of beaver, the skin is largely used as a hatting fur. Its tail is sold in Russia and India for its odour of musk.—*Waterston*.

Agih,	"		

Some writers have supposed the musquitos to be the flies alluded to in Scripture, sent as plagues, but Bruce thought this Egyptian plague might be the Bimb of Abyssinia, and this is probably correct. Four species are known, *Culex laniger*, *C. fuscianus*, *C. circumvolens* and *C. regius* a few sprigs of wormwood placed about the pillow, will generally protect the sleeper from their attacks or rub the worm-wood gently over the forehead and wrists, the last thing at night, and neither musquitoses or other noxious insects will give annoyance. These insects chiefly abound near stagnant water and near the great rivers. Along the banks of the Irawadi, every Burman

MUSKITO.

sleeps under a musquito curtain the insects are so numerous. Their passage from a river or tank is intercepted by trees and at Kimmendyne myriads hang about the trees. Captain Elphinstone Erskine also mentions that whenever the musquitoses were uncommonly numerous in Rewa (which was five miles from Niunque), he always used to be told that the boys had been disturbing the akan ni namu. This tree was completely covered with musquitoses, and so thick were they, that one could easily have taken a capful from any branch at one scoop. Every part of the tree, from the very top to the root, and in the same manner the branches, appeared to be one solid trunk composed of musquitoses. He was told by Thakonau that it had been so that since he was a boy; that it was the property of the tree to attract the musquitoses, and that, if never disturbed, the country would be entirely free from these troublesome insects. In India they are smoked out of a room by burning chips of wood. Various substances are employed by the Chinese to drive them away. Our boatmen, says Fortune, who heard him talking about the musquito, asked Sing-Hoo why he did not buy some musquito tobacco, which they said might be had in the village, and which would drive all the musquitoses out of the boat. Immediately, he says, I despatched him to procure some of this invaluable substance. In a few minutes he returned with four long sticks in his hand, not unlike the pastilles commonly used for burning incense in the temples, only somewhat longer and coarser in appearance. They cost only two cash each—made with the sawings of resinous woods—procured, he supposes, from juniper-trees—and mixed with some combustible matter to make it burn. A piece of split bamboo, three or four feet in length, is then covered all over with this substance. When finished it is as thick as a rattan or a small cane. The upper end of the bamboo has a slit in it for hooking on to any nail in the wall, or to the roof of a boat. When once lighted, it goes on burning upwards until within six inches of the hook, beyond which there is no combustible matter, and it then dies out. A somewhat fragrant smell is given out during combustion, which at a distance, is not disagreeable. Sometimes the sawdust is put up in coils of paper, and is then burned on the floors of the houses. Various species of wormwood are likewise employed for the same purpose. The stems and leaves of these plants are twisted and dried, and probably dipped in some preparation to make them burn. The musquito

MUSRINU.

has a mortal aversion to all these substances and wherever they are burning, there the little tormentors will not come. I procured, he adds, the sticks in question, and burnt them daily, after this; and although the insects were often swarming when I entered the boat or an inn, the moment their "tobacco" was lighted they quickly disappeared, and left me to sit at my ease, or to enjoy a refreshing sleep. A person informed him that they used the sawings of juniper or pine trees (pih heang fun, or sing shoo), artemisia-leaves reduced to powder (nai-hai) tobacco-leaves (can fun), a small portion of arsenic (po-za), and a mineral called nu-wang. To thirty pounds of the pine or juniper sawings, about twenty of artemisia, five of tobacco, and a small quantity of arsenic were added. From subsequent inquiries, he ascertained the composition to be pine and juniper sawings, wormwood leaves, and tobacco-leaves, reduced to powder, a small portion of nuwang and arsenic. Each article was well beaten up with water, then the whole mixed together, and in the form of a thick paste rolled on a slip of bamboo. On exposure to the air the substance dried quickly, and was then put away for sale. When finished the sticks are somewhat like the common joss-sticks of the country, or about the thickness and length of a light walking cane. Another substance, much cheaper than the last, is found in every town and village in the central and eastern provinces of the empire, but no doubt it is in use over the greater part of China. Long, narrow bags of paper—say half an inch in diameter and two feet long—are filled with the following substances, namely, the sawings of pine or juniper mixed with a small portion of nuwang and arsenic. The proportions are thirty pounds of sawings, two ounces of nuwang, and one ounce of arsenic. This mixture is not made up in the form of a paste like the latter but simply well mixed, and then run into the bags in a dry state. Each bag being filled is closed at the mouth, and then coiled up like a rope and fastened in this position with a bit of thread. Many hundreds of these coils neatly done up and placed one above another, may be seen exposed for sale in shops during the hot season, when mosquitoes are numerous.—*Davies' Chinese; Algiers in 1857*, p. 15. *Capt. Elphinstone Erskine, Islands of the Western Pacific*, p. 469. *Fortune's Tea Districts*, p. 180; *A Residence among the Chinese* p. 111. See Mosquito.

MUSSOI, a medicinal bark of the Archipelago, largely an article of trade.

MUSSOOR, HIND. the pulse *Ervum lens*.

MUSSORIE, HIND. *Coriaria Nepalensis*, Wall.

MUSSOORIE or Masuri, a sanatorium or hill station, in the Himalaya, which adjoins Landour on the west and consists of a series of ridges about 5 miles in extent running off almost east and west with frequent peaks, and with spurs or shoulders issuing irregularly down to the valley of Deyrah Dhoon on the south, and to the river Uglar or Uggulwar on the north, with deep wooded gorges between. Banog, a hill to the west of the settlement has been ascertained to be 7,545 feet above the level of the sea and to be in 30° 28' 29" N. lat. and 78° 32' 3" E. long. The river Jumna flows around the northern face of Banog and Badray bounds the settlement of Mussoorie on the west. Mussoorie was first resorted to as a sanatorium in 1823. It is built upon heights varying from 6,400 to 7,200 feet, the majority of houses being situated at probably the mean elevation of 6,800 feet. There is no table land of any extent and almost every building stands on a site, which it was necessary to level either on a peak or ridge, on the southern slope of the mountains. There are few houses on the northern face. The buildings are generally a considerable distance apart, but they are closer together towards the east and in the centre than towards the west, which is the direction in which the settlement is extending: The view of the snowy mountains to the north, (which on a clear day appears to be within a few hours journey) and of the beautiful valley of the Dhoon, spread out like a painted map at the foot of the hills to the south, has been greatly admired. The river Ganges and Jumna are visible from many parts of Mussoorie not only as they foam over their rocky beds in their impetuous race through the valley but stretching far away into the plains. The sta-

MUSSULMAN.

tion of Saharanpore is also to be distinguished with a glass, bounding the horizon over the Sawalik range of hills which shuts in the valley of the Dhoon to the south. Comparisons have been made between Simla and Mussoorie to the disadvantage of the latter on account of the nakedness of the hills, or at least the want of forest trees, and particularly of the deodar which gives such a peculiar character to the scenery, at the first mentioned station. In January and February the weather is wintry always with frost more or less intense, and occasional falls of snow. In the course of March the frost entirely disappears, and many trees put forth their new leaves. Showers of rain, and sometimes of hail with thunder storms are experienced in this month and in April, after which till the setting in of the rains in the middle of June there is generally settled summer weather. The rains are considerably heavier than at the neighbouring stations of the plains. They cease on or before the 18th of September and are succeeded by a beautiful agreeable season, which lasts till Christmas, and sometimes till the middle or end of January. In this period of the year scarcely a closed door is to be seen and the temperature gradually sinks from 64° in the shade, in the beginning of October into that of sharp winter, the frost becoming strong in the course of November. The temperature of a spring on the north face of Mussoorie is nearly 54½° which may be assumed to be the mean temperature of the place and the mean extreme daily range (as determined by a thermometer in an open north verandah in March 1838), the most variable month of the year, was less than 5½°. Mussoorie is found to be 20° to 25° degrees cooler than the neighbouring stations.

MUSSOOR PURPOO, TAM. *Ervum lens*.

MUSSUCK, or mushak HIND. inflated skins, generally of bullocks and goats, used for carrying water.

MUSSULMAN, AR. properly musulmin, a person of the mahomedan religion, it is the plural form of the Arabic muslim. A woman is called musulmani and the creed Islam. There are, in British India, about seventeen millions of this faith, principally of Arab, Persian and Moghul descent, with many converts, however, particularly in lower eastern Bengal. They are of two sects, sunni and shiah. Arabia, Persia, Asiatic Turkey, Central Asia, Egypt and Afghanistan, are largely mahomedan or mussulman. In European Turkey the mahomedans form about a sixth part of the population. The Afghans are mussulmans of the sunni sect with the

MUSTAJAR.

exception of the tribe of Beritchee, who belong to that of the shiah. The Parsivau and Eimak, who are subject to the Afghans, equally profess the faith of Islam but besides the two sects just mentioned some of them are of a third called Ali-Ilahae. The mussulman or mahomedan sects are very numerous one of them is the Wahabi. Derayah the Wahabi capital, is situated on the Wadi Beni Hanifah, one of the defiles by which alone the Nejjid-el-Arid can be entered. The Wahabi calls himself a Muwahhid, or Unitarian, in opposition to Mushrik—Polytheist—any other sect but his own, and at Meccah follows out his two principal tenets, public prayer for men daily. The founder of this religion was Abdul Wahab a native of Aijaene, a town in the district of El Aved. This man, in his youth, first studied at home those sciences which are chiefly cultivated in Arabia, he afterwards spent some time at Bursa, and made several journeys to Bagdad, and through Persia. After his return to his native place, he began to propagate his opinions among his countrymen, and succeeded in converting several independent Shaikhs, whose subjects consequently became followers of this leader.—*Ferrier's Hist. of the Afghans*, p. 291. *Jahuk Numa*, p. 523. *Wellsted's Travels*, vol. i. p. 5. *Burton's pilgrimage to Meccah*, vol. iii. p. 272. *Niebuhr's Travels*, vol. ii. p. 131.

MUSSUMBRA, SINGH. Ambergis.

MUSUMBRUM, TEL. Aloes.

MUSSING, a river at Cherrapunji.

MUST, HIND. Madda, SINGH. a period of temporary fury to which elephants are subject in the rutting season, and during which it is not safe even for the mahout or driver to approach them.

MUSTA, HIND. A kind of yellow color in silk.

MUSTA, SANS. *Cyperus juncifolius*.

MUSTAFA. See Kara-chi or Kara-tchi.

MUS-TAGH, a name of the Kowen Lun mountain chain. Aksu, a city of Chinese Tartary, lies to the south of the glacier pass, over the Mustagh in $L. 78^{\circ} 58'$, $L. 41^{\circ} 9'$, it contains twelve thousand houses, though Tinkowski states the number more probably at six thousand. It stands at the confluence of the rivers Aksu (white water) and Kokshai; it is the central point of the Chinese trade, and from it diverge all the great routes towards China, the Ili country and the cities both of Eastern and Western Turkestan.—*Yule Cathay*, vol. ii. p. 572. See Kuen-lun; Mountain.

MUSTAJAR, AR. A contractor.

MUSTARD.

MUSTAKAMU, or Tunga muste, TEL. *Cyperus hexastachys*, Rottl.

MUSTAKH, HIND. *Chenopodium*.

MUSTAKI-ROOMI, HIND. Mastio. The Mustagi-rumi, or mustagi of Amritsar is a Terebinthate resin, but the real mustagi-rumi is produced by the *Pistacia lentiscus* or *P. atlantica*.—*Powell's Hand Book*, vol. i. p. 411.

MUSTANG. See Bangolzye, Kelat.

MUSTARD, of commerce, is of a light yellow colour. The seeds of both black and white mustard are first crashed between rollers, and then pounded in mortars. The pounded seeds are then sifted. The residue in the sieve is called dressings, or siftings; what passes through is impure flour of mustard. The latter by a second sifting, yields pure flour of mustard, and a second quantity of dressings: by pressure, the dressings yield a fixed oil which is used for mixing with raps and other oils. Immense quantities of wheaten flour are employed in the adulteration of mustard, and many samples almost entirely consist of it: pea-flour is sometimes used: out of fifty samples of mustard which Dr. Hassall submitted to examination he had not met with a single instance of adulteration with any other farina than wheaten flour: genuine mustard, whatever be the price paid for it, is scarcely ever to be obtained; forty-two samples submitted to examination were all found adulterated, the adulteration practised, in every case, was the same in kind, varying only in degree, and consisted in the admixture of genuine mustard with immense quantities of wheaten flour, highly coloured with turmeric. Turmeric powder is the ground tuber of *Curcuma longa* one of the Zingiberaceae, it is of a dark yellow colour and consists of large cells, some of these are loosely imbedded in a reticular tissue, but others, and these the majority, are quite free: they may be recognised with facility under the microscope by their size and bright yellow colour. Although Dr. Hassall examined a large number of samples of mustard in no instance did he find turmeric powder absent. By some means or other probably by moisture and heat the turmeric powder is made to part with a portion of its colouring-matter to the flour which enters so largely into the composition of the mustard of the shops. Four qualities of mustard are supplied by the manufacturer. The first is called "second" it is usually of a bright yellow colour, but is thickly studded over with numerous black or reddish-black points: these are fragments of the husks of black mustard seeds. The next

MUSTARD OIL.

quality is termed "fine," it also presents a considerable number of black specks, but fewer than in the former case. The third quality is called "superfine," it is spotted to a much less extent, although minute specks are still visible. The fourth, or best quality, is the "double-superfine," in this the eye can scarcely detect husk at all, although with the microscope, a little may still be discovered. These several qualities are vend- ed to the public by a wholesale and retail establishment in the city of London at the following rates: "seconds," 5*d.*; "fine," 8*d.*; "superfine," 11*d.*; "double-superfine," 1*s.* 2*d.*, per lb. The qualities of samples varied much—from "second" to "double-superfine." The price also varied greatly—from 1*s.* to 2*s.* the pound, the ordinary charge made being 1*s.* and 1*s.* 4*d.* the pound.—*Hassall, Food and its Adulteration*, p. 123. See *Sinapis*.

MUSTARD SEED, Black.

MUSTELIDÆ.

Mustard oil is expressed in various parts of India from the seeds of different species of *sinapis*, especially from the black mustard seed. *S. glauca*, *S. bichotoma*, and *S. juncea*, are also extensively cultivated in the east for their oil, and *S. alba*, *S. arvensis*, *S. nigra* are also grown. The oil, as prepared from the seeds of different species of *sinapis*, is used in the northern parts of Hindustan, and in many parts of Malabar, for culinary purposes, in the same way as butter and ghee is on the Coromandel Coast. Mustard oil has of late been exported from Bombay to England and France. Five or six species of *sinapis* are cultivated in all parts of India, for the sake of the valuable oil they yield: those most frequently seen are *S. glauca*, *S. toria* and *S. racemosa*. The seeds of the "*Sinapis alba*" yield by expression 36 per cent. of a bright yellow, pleasant tasted, edible oil, having a strong smell, and slight taste of mustard. The seeds of "*Sinapis nigra*," yield only 28 per cent. of an oil in all respects similar to the above. The average price of mustard seed in eighteen large stations, in all parts of the Madras Presidency, for the quarter ending 31st October 1854, was Rs. 1-2-8 per maund of 25lbs., the maximum being Rs. 1-11-6 at Cannanore, and the minimum Rs. 10-5 at Nagpore. In Vizagapatam it costs Rs. 208 per sicca garce. The oil is not exported from Madras, but the seeds have been shipped as follows:

1847-48...	Cwt. 5,828	1850-51...	Cwt. 9,909
1848-49...	" 6,767	1851-52...	" 3,636
1849-50...	" 9,435	1852-53...	" 16,075

It is used in most parts of India in cookery, and is considered superior to all other oils for anointing the body, which it is supposed to invigorate. In medicine, it is sometimes given internally, but is more frequently applied as a rubefacient.—*Ainslie Materia Indica, Faulkner Commercial Dictionary, Madras Exhibition Juries Reports*.

MUSTARD-TREE. The plant referred to by this name in Scripture is, according to Dr. Royle, the *Salvadora persica*, a native of the East Indies.

MUSTAROO, DUK. *Artemisia indica*. Willd.

MUSTARU, TEL. *Grangea Maderaspatana*, Poir.

MUSTER, ANGLO-INDIAN, a pattern, from Portuguese mostro.

MUSTER, GER. Mustard Seed.

MUSTI-GHENZA also *Musuli*, *TEL.* *Nux vomica*, *Strychnos nux vomica*, *Linna.*

MUSTIKA, amongst the Malays of Java, means an amulet, which is always some very scarce substance and being worn about the person they suppose to act as a talisman, and ward off evil. The *Mustika Kerbo* or Buffalo amulet is quite white, and round like marble, nearly an inch in diameter, and semi-transparent: it is stated to be found at Panggal. The *Mustika Waringin* a calcareous concretion is found at Ngadi Rejo. It is quite black and a little smaller than the *Mustika Kerbo*. *Waringin* is the

MUTAWALI.

name of the Ficus Benjamina tree, which always adorns the open plain in front of the houses of Javanese chiefs. Amulets, are, however, worn by almost all eastern nations. They are especially prized by mahomedans, of whom both young and old wear them. They are usually put on the young to ward off disease and to guard from the evil eye, and consist of figures with numbers on pieces of paper, or Arabic words, often extracts from the Koran, engraved on pot stone or silver or gold and worn from the neck. They are also put over the door porch or on the house wall.—*Journal of the Indian Archipelago*, No. vi.—xii. June—December 1853, p. 274. See Charm; Nadoli.

MUSTUNG has a healthy climate and fertile soil. It contains no Afghans, the fixed inhabitants are Dehwar, mixed with the Raisani, Sherwani, Mahomed Shahi, Bangul-zye, Lari, and Sirpherra tribes of Brahui. The Bangul-zye exclusively occupy Ispriji, but reside also at Shall and Mustung and in winter repair to Talli near Lehri.

MUSUMBAR, DUK. Aloes.

MUSUR. HIND. SANS. Ervum lens. See Dholi.

MUT, HIND. Carex indica. It is used to form those parts of the snow shoes in Pangi and Lahaul which are most liable to be torn—it grows at a great altitude. Eriophorum comosum or babur, is much used in the outer Himalaya for making rope.—*Powell, Hand-book*, vol. i. p. 521.

MUTA, Mahomedans of the shiah sect are allowed to marry by the Muta form. This may be for a mutually recognized temporary period, or a permanent marriage with a person of inferior rank in life.

MUTA KURMUL, DUK. Dillenia speciosa.

MUTTALKAM. MALEAL. The headman of the Chagon, low caste.—*Wilson*.

MUTALPATTA, is the office of the Chagon headman.

MUTAMI, MALEAL. Eleusine coracana, Gaert. See Natchenny.

MUTARFA. AR. A tax on trades.

MUTASA. HIND. Sugared cakes. qu? Batasa.

MUTASADDI. PERS. HIND. A writer, a clerk.

MUTATI WANLOO. TEL. the Reddi of the Tannil and Teluga races and the potail of the mahrutta; the head of the village authorities. See Bara Baluti.

MUTAUMY, MALEAL. Eleusine coracana.

MUTAWALI, AR. The trustee of any religious building, a trustee of a mosque.

MUTAWALI, an inconsiderable tribe occupying the plain of the Beccah in Lebanon,

MUTHURA.

between the Libanus and Anti-Libanus, the sides of the Anti-Libanus and the lower part of the southern Libanus, extending to the north-east of Sur or Tyre; but at present, they form only an inconsiderable portion of the population of this part of Syria. See Lebanon.

MUTCHE, TAM. Lablab vulgaris. Savi.

MUTCHI KA UNDA, DUK. Fish roe properly Mat'shi-ka-unda.

MUTER, HIND. Carex Indica. See Mut.

MUTE SWANS. See Crane.

MUTHERA, MALEAL. Dolichos uniflorus. Lam.

MUTHERI, TAM. of Ceylon, satinwood, by the Portuguese called Buratu. A handsome and valuable wood, the most durable of any in Ceylon for general uses, provided it be seasoned in the shade, it may be converted into handsome furniture &c. In consequence of its weight all trees are cut in lengths of from ten to twelve feet, for the purpose of getting it floated down the rivers from the forests, which is done in canoes. It may be obtained from twenty-five to forty feet long, and the largest diameter thirty-six to forty inches.—*Edye, Ceylon*.

MUTHERI KOTTA YENNAI, TAM. oil of nut of Anacardium occidentale.

MUTHI, HIND. a handful, the right granted to religieuses to take a handful at harvest.

MUTHITA, the modern Tirhut. The country north of the Ganges, between the Gandak and Kosi rivers, comprehending the modern provinces of Purniya and Tirhut. The remains of the capital founded by Janaka and thence termed Janakipur, the Janickpur of the maps are still to be seen, according to Buchanan, on the northern frontier.—*Hind. Th.* vol. i. p. 298.

MUTHOO COOPOO. TAM. An article of jewellery.

MUTHRAN. HIND. Cyperus longus, C. rotundus, &c.

MUTHRAS, a Bactrian word signifying the sun. See Mat'hra, Mithrasun.

MUTHUN. See India.

MUTHUNKA PILLOO, TAM. Grass Corn, a grass, which grows wild, but was first cultivated in Chittoor by Miss Pereira. It produces abundantly, and the grain is cooked in the same way as paddy and ruggy.—*M. E. J. R.*

MUTHURA, BENG. Callicarpa incana.

MUTHURA, Muttra or Mathura, a holy city of India, one of the most ancient places in Hindusthan. It is famous in the history of Krishna, as the stronghold of his enemy raja Kansa; and it is noticed by Arrian,

MUTHURA.

on the authority of Megasthenes as the capital of the Suraseni. Surasena was the grand father of Krishna, and from him Krishna and his descendants, who held Mathura after the death of Kansa, were called the Surasena. According to Arrian, the Suraseni possessed two great cities, Methoras and Klisoboras, and the navigable river Jobares flowed through their territories. Pliny names the river Jomanes, that is, the Jumna, and says that it passed between the towns of Methora and Klisobora. Ptolemy mentions only Mathura, under the form of *Modura*, *Modoupa*, to which he adds *ἡ ἁγία πόλις*, that is "the city of the gods," or holy city. In the seventh century the famous city of Mathura was the capital of a large kingdom, which is said to have been 5,000 li, or 833 miles, in circuit. If this estimate be correct, the province must have included not only the whole of the country lying between the districts of Bairat and Atranji, but a still larger tract beyond Agra, as far as Norwar and Seopuri on the south, and the Sindh river on the east. Within these limits the circuit of the province is 650 miles measured direct, or upwards of 750 miles by road distance. It includes the present district of Mathura, with the small states of Bharatpur, Khiraoli and Dholpur, and the northern half of the Gwalior territory. To the east it would have been bounded by the kingdom of Jijhaoti, and on the south by Malwa, both of which are described by Hwen Thsang as separate kingdoms. The city is surrounded by numbers of high mounds; several of which are no doubt old brick kilns; but many of them are the remains of extensive buildings, which having been dug over for ages in search of bricks, are now mere heaps of brick-dust and broken brick. Taking Muttra as a centre the circle described by a radius of eighty-four miles would give the extent of ancient Vrij, the seat of all that was refused in hindooism and the language of which, Vrij-boli, was the purest and the most melodious dialect of India. In all Vrij, the most classic spot is Brindabun. As the birth place of Krishna, Muttra is as sacred to the Vishnavites as Bethlehem is to the Christians. A Dwaita prince had overthrown the Sena dynasty and re-established the aboriginal domination at Muttra. But Krishna was born in August, during the height of the rains. The most sacred spot in all Muttra is the Bismraghaut, where Krishna and Buldeo rested from their labours of slaying Kansa, and dragging his corpse to the river side. In Hwen Thsang's time there were only five brahminical temples in Muttra—in the

MUTHYAN-JO-ZOR.

middle of the nineteenth century, there was only one Jain temple in Brindabun. Fa Hian and his companions halted at Muttra for a whole month during which time the clergy held a great assembly and discoursed upon the law. After the meeting they proceeded to the stupa of Sariputra, to which they made an offering of all sorts of perfumes, and before which they kept lamps burning the whole night. In Hwen Thsang's time the number of towers and monasteries was the same, but that of the monks had been reduced to 2,000. The king and his ministers were all zealous buddhists. In the Bismraghaut is annually held a great bathing mela, or assembly, called Jumna-ka-Boorkee, on which occasion the gathering of men from Behar, Bundelcund and other remote parts of India exceeds more than a hundred thousand. To the Chowbay race, the occasion proves a great harvest of gain. The pittances offered to the images of Krishna and Buldeo at the ghant sometimes amount to thirty or forty thousand rupees. The Greeks saw the Hindoos worship Bacchus in ancient Methora. This may possibly refer to, 'the curious Greek-clad statue,' which, with his portly carcass, drunken lassitude, and vine-wreathed forehead, is considered by the antiquarians to be the 'well-known figure of the wine-bibbing Silenus.' The statue was discovered along with a Bacchic altar in 1836. It does not appear probable to have been worshipped by the buddhist or hindoo of olden time, and the way in which the question of its presence can most reasonably be solved, is to assume the residence of a body of Bactrian Greek sculptors who found employment for their services amongst the tolerant buddhists of the great city of Muttra, about the beginning of the christian era. Long has any buddhist or Greek god ceased to be worshipped in Muttra. The most favourite local deity now is Krishna, who is adored in nearly all the temples, abounding in the town which owns his exclusive jurisdiction. Contiguous to Muttra are those great sandstone quarries which for ages have furnished materials to the architects of Upper India for building the houses, shops, temples, and ghauts of its principle cities. In Muttra, the ghauts are light and graceful, in Benares, they are severe and simple. Buddhism in one shape or another, seems to have always existed in Muttra maintaining its ground under the modified form of Jainism, after the votaries of Sakya Muni had lost their footing.—Cunningham's *Ancient Geography of India*, p. 373, 374. *Tr. of Hind.* vol. ii. p. 22-44. See Vrij.

MUTHYAN-JO-ZOR, a popular exer-

MUTINY.

cise in Sindh, of placing the fists on the ground, and raising up a boy or a man who stands upon them. Chambo Wathan, another feat, consists of interlacing the fingers and trying to disengage them from the grasp of the adversary. Pera to Uthan, squatting on the hams, lifting one leg off the ground, and then slowly rising up by means of the other, no easy task. Kakk Khanan, here the gymnast, in the squatting position with both arms behind the back, picks up with the lips, a bit of straw placed on the ground before him — *Burton's Sindh*, p. 290.

MUTIALAMMA. One of the non-hindu goddesses of the peninsula of India. See Hindu.

MUTI-KOTTE-YENNAL. TAM. Oil of *Strychnos nux vomica*?

MUTILLA ANTIGUENSIS. Linn. *Mutilla occidentalis*, Beer botic, is a most beautiful scarlet velvet colored insect, about the size of a large pen, commonly found in rainy weather, throughout British India. These insects are officinal, and are kept by the druggists. The native doctors use them against snake-bites, and in colic of horses. — *Honigberger*, p. 514.

MUTILLIDÆ, a genus of insects of the order Hymenoptera, comprising two genera *Mutilla*, and *Tiphia*.

MUTINY, has occurred amongst the British Indian Army on several occasions. In June 1764, the sepoys in the service of the E. I. Company mutinied for an increase of pay and blatta, but Major Munro quelled the mutiny by blowing many away from guns. In January 1768, the double blatta was abolished. It had been granted to the E. I. Company's Army by Mir Jafir in gratitude for their services. But on its abolition both officers and men mutinied, and it was only put down in fifteen days by the severe measures which Clive adopted. In 1795, the Bengal officers broke out into open rebellion. Its cause was Lord Cornwallis' abolition of all offices of gain in the military branch of the service. The revolt was settled by the concession which Sir John Shore made to them. Disaffection sprung up amongst the European officers of the Madras Army, in the early part of the nineteenth century, with whom a few regiments of sepoys sympathized, but it was quickly subdued. About the year 1824 at Barrackpore disaffection was again manifested. In 1857 the greater part of the army of Bengal and several Regiments of the Bombay Army revolted. The first signs occurred near Calcutta but the revolt continued by the outbreak of the native cavalry at Meerut, on the 10th May 1857, and before the end of

MUTTALLA.

1857 nearly all the Bengal Army, with several regiments were swept away, but before this could be done, many of the predatory tribes and numbers of the civil population engaged in the rising, and a rebellion of nearly all Upper India was the result. The Sikhs of the Punjab greatly aided in re-subduing the populations. Disaffection occurred amongst the European soldiers of the E. I. Company's Army, on the 2nd May 1859 which resulted in about 10,000 soldiers taking their discharge.

MUTKAR, HIND. *Leptopus cordifolius*.

MUTKEE. or *matki*, HIND. A small earthen pot or jar.

MUTKEE-PULLY, BENG. HIND. *Cymopsis psoraloides*.

MUTKEE SHAH, a mohurrum fiquer.

MUTLOOB, AR. The object or thing wished.

MUTKEKE PHALLI. HIND. *Dolichos fabæformis*, small *sabre benn*. This is grown the same as the larger sort. — *Riddell*.

MUTOO SING. Pearls.

MUTOPOLAGHUM, TEL. *Pavonia odorata*.

MUTRA. HIND. *Sansevieria zeylanica*.

MUTRAJ, a Tiling race, subdivided into Bhooi and Mutraj; the Bhui of Tilingana is merely classed as a Tiling sudra, who occupies himself as a palanquin bearer. But where settled, away from his fields and agricultural pursuits, the Bhui is engaged in catching fish by the net. The Mutraj-Vadu, or in the plural, Mutraj-wauloo, are a Telugu sudra race in Bellary, where, as with the Oor-bhui-wauloo, they are employed as village-watchmen. These two sudra races rarely enter the regular native Army which the British have raised in India, but take employ as mercenary soldiers under native chiefs.

MUTTI, TAM. *Cardium edule*.

MUTTI, GUZ. Pearl.

MUTTI-PAL. The resin of the *Ailanthus malabaricus* tree. See Resins, Mutty-pal.

MUTTI KA TEL, DUK. HIND. Petroleum: properly Matti ka tel.

MUTTIKACHA-VADU, TEL. A sudra caste of the Tiling people. See Mutraj.

MUTRAN, HIND. *Cyperus juncifolius*.

MUTTIAH See Inscriptions.

MUTTU, HIND. Rhamnus virgatus.

MUTTUK, a branch of the Singpho group. The principal tribes on the frontier of Upper Assam are the Mutrak, the Khaunti, and the Singpho. The Bar Senapati or chief of the Muttak branch of the Singpho entered into an engagement in May 1826, whereby he acknowledged the supremacy of the British, and bound himself to supply 300 soldiers in time of war. The management of the country was left in his own hands, except as regards capital offences. In January 1835 the obligation to supply troops was commuted to a money payment of Rs. 1,800 a year. In 1826, similar agreements were made with the Khauntee chief of Saddeyn, but in 1839 they attacked the town of Saddeyn, and many persons as also Colonel White, the Political Agent, was slain. Agreements were also made in May 1836 with the Singpho. These tribes were implicated in the Khauntee rising in 1839, but they were allowed to surrender under conditions. Many of the Singpho clans have become extinct and the main body have left Assam for Hongkong in upper Burmah.—*Aitchison's Treaties*, &c., p. 127. See India. Singpho.

MUTTUMARI See Hindoo.

MUTTY PAL, the resinoid exudation of Ailanthus malabaricus D. C., is a peculiar substance, first mentioned by Buchanan, who observed it in the Anaimalai forests but found also in Cochin and Travancore, and is said to be used as incense. M. E. J. R.

MUTUR, BENG. Common pea, Pisum sativum.

MUTYA, HIND. Jasminum sambac.

MUVI, or Muvvi, Tel. Alphonsen latera, Hook. & Th.—Uvaria latera, R. iii. 160.

MUYETTI COITAY YENNAI, TAM. See Oil.

MUYYAKU PONNA, Tel. Psendarthria viscosa, W. & A. Hedysarum vis. R. iii. 356, also Smithia sensitiva, Ait. R. iii. 342. Br. makes it an Acacia, to which the name muy-

MUZHABI.

ya "to shunt," has reference, but it also means "trifoliate."

MUYN also **MAINPHUL**, HIND. Vangueria spinosa? also Morinda spinosa.

MUZARI, a wild predatory tribe of Baluch, on the western bank of the Indus near Shikarpore who submitted to Sir A. Burnes at Khyrpore. They rode mares in their chapans or forays. The Muzareo, formerly dwelt in the hills, but migrated to the plains where they have since remained, and have been a thorn in the side of successive governments. They can muster 4,000 fighting men, and more than a hundred horse-men. Their head-quarters are now at Rojha below Mithankote, and near the confines of Sind. When Mithankote was conquered by the Sikhs, they harassed the new-comers and hid waste the acquisition. The vicinity of Mithankote still bears traces of desolation. A strong Sikh force moved against them, and thus the lower extremity of the Derajat, down to Shawullee, was then added to the Sikh dominions, and at annexation became included in British territory. Maharajah Ranjeet Sing subsequently received the Muzareo chief at Lahore. The Muzareo are not disloyal subjects, and aid in keeping the Marree in check, against whom they are bitterly opposed. But they are unfortunately addicted to cattle-lifting. In fact they varied on more or less an organized system of theft, not only in British territory on both sides the Indus, but also in Bahawalpoor territory. To prevent this, the formation of river police was commenced, and their depredations diminished. See Khyber.

MUZAR-OOL-HARAM, AR. The holy monument near Mecca.

MUZERE also Meknates also Kauntum, SANS. Tel. Loadstone.

MUZHAB, AR. A religious sectarian belief, in distinction from Deen, which means a faith. Christian Deen would be Christian faith. Protestant Mazhab, the protestant form of the Christian faith.

MUZHABI, the Rangretha Sikhs are sometimes styled Muzhabi, or of the religion. The name may also be applied from the circumstance that the converts from Islam are so called, and that many sweepers throughout India have become mahomedans. Chooras, a man of the sweeper caste, brought away the remains of Togh Bahadur from Delhi. Many of that despised, though not oppressed, race have adopted the Sikh faith in the Punjab, and they are commonly known as Rangretha Sikhs. The sheeah mahomedans are also called Muzhabi.

MYURA.

MUZIRIS. Cranganore, on the Malabar coast, in lat. 10° 12' N., is built on the Cranganore or Aycotta river. Cranganore seems to have been one of the most ancient capitals of Malabar, and in some of the ancient copper deeds appears to be called Muyiri-Kodu, which a writer in the Madras Journal indicates as perhaps identifying it with the classical Muziris?—*Cunningham's History of the Sikhs*, pp. 70-75. MYURA. Hwen Thsang describes the town of Mo-yu-lo, or Mayura, as situated on the north-west frontier of Madawar, and on the eastern bank of the Ganges. The vicinity of Ganga-dwara, or the Ganges gate, which was the old name of Haridwar or Gate of Hari, shows that Mayura must be the present ruined site of Mayapura, at the head of the Ganges canal. But both of these places are now on the western bank of the Ganges, instead of on the eastern bank, as stated by Hwen Thsang. The name of Haridwara, or "Vishnu's Gate," would appear to be comparatively modern, as both Abu Riban and Rashid-ud-din mention only Ganga-dwara. Kalidas, also, in his *Meghaduta*, says nothing of Haridwara, although he mentions Kankhal; but as his contemporary Amarasiuha gives Vishnupadi as one of the synonyms of the Ganges, it is

MYCTERIA AUSTRALIS.

certain that the legend of its rise from Vishnu's foot is as old as the fifth century.—*Cunningham's Ancient Geography of India*, pp. 351-353. See Gauges; Gangotri.

MYAS HORMUS. Gibbon says every year about the summer solstice, a fleet of 120 vessels sailed from Myas Hormus, a port of Egypt on the Red Sea. The coast of Malabar, or the Island of Ceylon, was the usual limit of their navigation, and it was in those markets that the merchants from the more remote parts of Asia expected their arrival. Mr. Gubbins has pointed out that in classical days the extremity of the peninsula was the entrepot of commerce between the east and the west.

MYAT-YA, BURM. also Ta-yau. *Grewia floribunda*, Wall.

MYAUK SOOK, BURM. *Artocarpus*, species.

MYAUN-NGO, BURM.? In Amherst, white sissoo; used for rafters. *Cat. Ex.* 1851.

MYAUP-LOAUT, BURM.? In Amherst, a timber tree, a superior kind of Toon wood. supposed of the genus *Cedrela*.—*Cat. Ex.* 1851.

MYAVERAM, a town in Tanjore.

MYAY, BURM.

MYAY, BURM. Earth.

MYA-YA, BURM. *Grewia microcos*, Linn. In Amherst a hard and close-grained wood, used for rafters; it is strong and durable, and would answer for beams, &c., being exempt from the attacks of insects.—*Cat. Ex.* 1851.

MYA YA GYEE, BURM. *Grewia floribunda*, Wall.

MYA-YA-NGAI, BURM.? A tree of Moulmein, wood used for ordinary house building purposes.—*Cal. Cat. Ex.* 1862.

MYAY-GYEE-HLOP-HGYING, BURM. Earthquakes.

MYAGRA, a genus of birds of the family *Tchitreadæ*. The *Tchitreadæ* consists of 6 gen. 12 sp. viz., 3 *Tchitreia*; 2 *Philentoma*; 1 *Rhipidura*; 4 *Leucocerca*; 1 *Myagra*; 1 *Cryptolophia*.

MYA-KA-MAUN. BURM.? A valuable strong, black, Tavoy wood; used for knife handles.—*Wallich*.

MYAM-MA. BURM. The Burman race, this word is the source of the European name Burmah.

MYAMA-GYI. See Burmah; India.

MYANAS a resin said to be produced from the *Calophyllum calaba*.

M'YAN-MA. See India.

MYCOSHEMA. See *Madjcoshema*.

MYCTERIA AUSTRALIS. Al-koku SINGH. called so, meaning man heron, from its great size.

MYGALE FASCIATA.

MYCTERUS LONGICARPUS, *Edwards*. A crustacean of the Cape of Good Hope.

MYE, *Tam.* Ink.

MYEET PYAI, *Burm.* *Melastoma malabathricum*, *Linn.*

MYEK, *PIN. Burm.* Grasses.

MYELAT. See *Shan*.

MYENG-TA-BEP, *Burm.*? A strong, bluish-grey Tavoy wood; adapted for handles.—*Dr. Wallich*.

MYEN-MO, *Burm.* In Burmese cosmology, the great mountain, Maha-Meru, surrounded by its seven concentric and graduated ranges, in the centre of this Sakwala or Mundane system, which again is encompassed by a circular wall of rock called the Sakwalagala. One of the Burmese feasts, at the termination of their Wa or Lent, is called Tsee-mee-myen-mo, or Myen-mo lamp lights. The streets are illuminated and in them are exhibited high round structures, to represent Mount Myen-mo covered with little figures of its spiritual inhabitants. This imaginary central mountain is several millions of miles high, around which, according to the Burmese theory of the solar system, are firmly fixed four great islands, on the southern of which Asia and Europe are situated, the sun which lights them revolving round the central mountain. Myen-mo mountain forms the centre of the Sakwara or Sekhya system of cosmogony. One of the four great islands which surround it is Jambu-dipa, the world we live in.—*Yule*, p. 172.

MYE-WOTE, *Burm.* A goat-sucker? a snipe?

MYFORE. See *India*.

MYGALE AVICULARIA, builds a strong white web and Mr. Bates found two finches involved in it, one dead, the other dying. Madame Merian, in a work on the insects of Surinam, published in 1705, figured the *Mygale avicularia*, in the act of devouring a humming bird. The accuracy of her statement has since been impugned by a correspondent of the Zoological Society of London.—*Bates' Nat. on the Amazons*, vol. i p. 161.

MYGALE FASCIATA, a Ceylon spider, the limbs of which, when expanded, have a diameter of 6 to 8 inches. By day, it remains concealed in its den, whence it issues at night to feed on larvæ and worms, cockroaches and their pupa, its food consisting of soft insects and annelides. It makes its nest in walls, trees, or sheltered by stones. It is lined throughout with a tubular silk tapestry, so fine and closely woven as to be water-tight, and at its mouth is a little platform stayed by braces. In the rainy

MYLABRIS.

season the platform is extended so as to form an awning. The *Mygale fasciata* is not only sluggish in its habits, but disgusting in its form and dimensions. Its colour is a gloomy brown, interrupted by irregular blotches and faint bands (whence its name); it is sparingly sprinkled with hairs, and its limbs, when expanded stretch over an area, of 6 to 8 inches in diameter. It is familiar to Europeans in Ceylon, who have given it the name, and ascribed to it the fabulous propensities of the tarantula. This hideous creature does not weave a broad web or skin, a net like other spiders but nevertheless, it forms a comfortable mansion in the wall of a neglected building, the hollow of a tree, or under the eave of an overhanging stone.—*Tennent's Sketches of the Nat. Hist. of Ceylon* p. 465 to 467.

MYGALE MOSCHATA. See *Sorecides*.

MYHEE a pass in Arracan is in lat. 19° 14', long. 94. 30'. Myhee village is a police station.

MYHERE. This state was originally a dependency of Rewah. On the occupation of Bundelcund, thakoor Doorjun Sing was confirmed in his possession on his executing a deed of allegiance. The area of Myhere is about 400 square miles; the population 70,000, and the revenue Rs. 74,200.

MYHLENAH. *Tam.* Mylelu, *Malay*. A Malabar and Canara wood of a greenish tinge, and very close grained; it grows to about twelve or fifteen feet long, and two and a half feet in diameter. It produces a fruit like green pepper; its leaves resemble the mango: the wood is generally considered strong and durable, and the native carpenters procure from its branches the small crooks for the knees and timbers of boats, &c., and the large limbs for the frames of native vessels. The tree is scarce in the north part of Malabar and Canara, and not known in Ceylon.—*Edye, Forests of Malabar and Canara*.

MYHULA, *Hind.* *Tulipa stellata*.

MYIT, *Burm.* A large river.

MYJERTHEYU. A tribe of Somali.

MYKEK, *Pers.* *Caryophyllus aromaticus*, *Linn.*

MYLABRIS, a genus of insects of the order Coleoptera, possessing properties identical with those of the blistering beetle *Cantharis vesicatoria*. The ancients chiefly employed two species of *Mylabris*, one of which, the *M. cichorii*, the telini of the hindoo, has been used for ages, and is so at present by the European and native physicians of India and China. The blistering flies of India are chiefly the *Mylabris* or *Meloe cichorii*, the *Cantharis gigas*, and the *Cantharis violacea*.

MYLABRIS.

The Meloe or Mylabris cichorii is common in the neighbourhood of Dacca, in the Hydrabad country, in Karnool, and numerous other localities. The insect is about an inch long, and one-third broad; the elytra or wing covers are marked with six cross stripes of deep blue and russet brown. The Buprestis of ancient writers is met with in the bazars under the name of the golden fly (sonamukki.) The Cantharis violacea is often mixed with specimens of Meloe in the bazars. The Telini fly, if procured before the mites have commenced its destruction, yields on an average, one-third more of cantharidin than the Spanish fly of the European shops. The blue fly is of uncertain strength; the Buprestis in all the specimens obtained, was quite inert. A species of Meloe called the *M. trianthema*, from its being usually found on the plant named *Trianthema decandra* (biscopra, HIND) was described by Dr. Fleming. A tincture, acetous tincture, plaster, and ointment of the Meloe cichorii are described in the Bengal Pharmacopœia. Some prejudice exists against the article on account of its alleged excessive severity of action. This is solely owing to the presence of a greater quantity of cantharidin than that contained in the common fly. Diluting the tincture, and adding to the proportion of lard and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects. At the Madras Exhibition of 1855, specimens of the Indian blistering beetles, *Mylabris pustulata*, and *M. punctum* were exhibited by Dr. Collas of Pondicherry, those were accompanied with a full and interesting report on their blistering properties printed in the "Monitor Official" of 2nd March 1855. *M. pustulata*, and *M. punctum* are found in large quantities at certain seasons all over Southern India. The officinal Blistering Fly has had a variety of names. It was called Meloe vesicatorius by Linnaeus, *Lytta vesicatoria* by Fabricius, and *Cantharis vesicatoria* by Geoffroy, and now by the Pharmacopœias. The name *xanthapis* was applied by the Greeks to a species of Coleopterous insect which possessed the properties of the officinal blistering beetle, but it was distinguished by yellow transverse bands. This is the characteristic of species of *Mylabris*, one of which, *M. Fusseleni*, occurs in the south of Europe, and another, *M. cichorii* throughout the east. In India it is called teloe or felini, and teloe mukhee, or the Oily Fly, from the oil-like exudation which the insects of this genus give out from the articulations of their legs when seized. Another species, *M. trianthema*, is mentioned by Dr. Fleming, and the *Lytta gigas*. *Fab.* is

MYMENSING.

found in India as well as in Senegal. One is mentioned by the Arabs under the name of zurareh. *Mylabris cichorei* and *M. pustulatus* are used by the Chinese. About 180 lbs. forwarded in 1860 from Bombay by Dr. Birdwood to test the market value in England, were sold at 5s. 8d. per lb.—*Royle, O'Shaughnessy*, p. 684; *M. E. J. R. Cat. Bo.* 1862. *Dr. Hunter, Tr. Beng. As. Soc. vol. v.* p. 216. *Smith Mat. Med. of China.*

MYLABRIS CICHORII.

Pan mau,	CHIN	Telini,	HIND,
Teli Makhi,	HIND		

Of southern Europe, southern and eastern Asia, is obtainable from June till December in the granite district of the Nizams territories and can be gathered for a rupee a pound. In China they are met with on species of Faba, Dolichos, Euonymus, Silene and other plants. It is considered in China useful in scrofula, renal ailments, syphilis and hydrophobia.—*Smith Mat. Med. of China.*

MALABRIS SCHONHERII.

TS-AN-mau, CHIN,

Occurs in China and is found on the *Zizyphus*.—*Smith.*

MYLE ELLAH, TAM. ? In Travancore, a wood of a light green colour, specific gravity 0.896. Used for building houses only.—*Col. Frith.*

MYLI KONNI. TAM. Poinciana pulcherrima.—*Linn.*

MYLITTA, the goddess of the Babylonians, at whose temple every woman had once in her life to sacrifice as the necessary preliminary to marriage. See Ken.

MYLITTA LAPIDESCENS.

Lui-hwan,	CHIN.	Fah-ling,	CHIN,
-----------	-------	-----------	-------

A fungus of China resembling a truffle, also the fruit of *Gynocardia odorata*, and similar to the vegetable substance dug out of the chalk beds in the mountains separating Travancore and Tinnevely.—*Smith.*

MYLOG. The sunnad of this Rajpoot state, dated 4th September 1815, contains the usual conditions and the tributary payment is Rupees 1,450. Revenue, Rs. 8,000, population 7,358.

MYMANA, an independent state S. W. of Balkh.

MYMENSING, a district of Bengal, west of Silhet, watered by the Brahmaputra, chief town Nussurabad. The district can furnish specimens of the best sunn (*Crotalaria juncea*) and the best pat or jute (*Corchorus olitorius*) and maestoc pat, (*Hibiscus cannabinus*) grown in Bengal. The fibres of these plants are commonly used for making twine, ropes, sails, screens, bags, and paper, they are

MYOUK-GNAU.

dressed and exported, in large quantities, from Serajegunge and other parts of this district of Bengal, to Calcutta for shipment to Europe. This district also produces oil seeds, as mustard, sesamum, rape and linseed. The two latter are of a superior quality and are now valuable exports to England.—*Taylor*. See Kooch.

MYN. HIND. *Randia dumetorum*. *Linn.*

MYNPAT. A table-land, about 30 m. S. E. from Sirgoojah town, and about 3,000 or 3,500 ft. high. On the South West frontier of Bengal, are Chota-Nagpore, Sirgoojah, Palamow, Rangunrh, Hazareebagh, Mynpat and Amarkantak. The elevation of Chota-Nagpore, is 3,000 feet with hills running E. and W., but of little height; Sirgoojah, is mountainous, rising 600 to 700 feet above the level of Chota-Nagpore. Palamow district is very mountainous. Hazareebagh town, 24° ; $85^{\circ} 54'$; 1,750 feet. Slope of country to S. towards Sumbulpore N. and E. parts of district, very mountainous, but level, and even depressed towards the Mubanddy. Sumbulpore town, only 400 feet. Orissa table-land then rises on the southern side of the Mahanuddy, in some places to 1,700 feet backed by the chain of E. Ghauts. Amarkantak, jungly table-land, $22^{\circ} 40'$, $81^{\circ} 5'$; 3,500 feet. The soil in the plains is generally fertile, producing abundant crops of wheat, barley, rice, pulse, excellent vegetables, cotton and sugar-cane. The uncultivated parts are overrun with a coarse grass.

MYN-PHAL, HIND. Fruit of *Gardenia dumetorum*.

MYRCIA ACRIS, *D. C.* and *M. pimontoides*, *D. C.* *Syns.* of *Eugenia acris*.—*Wight*.

MYRICACEÆ. *Lindl.* The Gale tribe of plants comprising in India, 2 Gen. 3 species, viz., 2 *Myrica*; 1 *Putranjiva*, drupe 1-seeded; seed erect. They are common in the temperate parts of the world, especially in North America, and the Cape of Good Hope. The order embraces 3 genera and about 20 species. It is the Greek *Myrica*. There are several species, shrubs or small trees. *Wight* gives *Myrica integrifolia*, and *M. Nilagirica*, *Fortune* says, the Yang mae, of China appears to be a species of *Myrica*, allied to the Himalayan *M. sapida*, noticed by *Frazer*, *Royle*, and other writers. The Chinese variety is, however, much superior to the Indian. Indeed he believes the Chinese have both, but use the Indian one as a stock for grafting upon. There is a very large plantation of this tree in Chusan, on the sides of the inland hills forming striking objects on the hill sides. The trees were bushy, round-headed, and from fifteen to twenty feet in height, loaded with dark-red fruit, not unlike, at first sight, the fruit of England's *Arbutus*, although very differently formed and much larger. He observed two kinds, one with red fruit, and the other with fruit of a yellowish colour; grafted plants were secured for India. This fine fruit will no doubt succeed admirably in the Himalaya, for already there is a variety—far inferior indeed to the Chinese kind, but yet a plant requiring the same soil and temperature—common on these hills. It is the Kaiphul of the hill-tribes of India. The fine variety of Yang-mae is grafted upon the wild kind, which the Chinese call the san or hill variety of *Myrica sapida*. The properties of the species are of no great importance: the fruits of *M. integrifolia*, *M. sapida* are eaten.

Myrica integrifolia, *Roxb.* *Khasiya*.

MYRICA SAPIDA.

M. sapida, Wall. Himalaya, Sutlej to Silhet.

Putranjiva Roxburgii Wall Coromandel, Kennery, Kandalla, Salsette, Belgaum, Concans, Silhet, Assam, Ondh. Himalaya.—*Eng. Cyc. Fortune*, pages 344; 345; 354; *Fortune's. A Residence among the Chinese* p. 64.

MYRICA CERIFERA, the Candleberry myrtle abounds in the Bahama islands and might be introduced into India. The shrub produces a small green berry, which, like the hog plum, puts out from the trunk and larger limbs. Much patient labor is required in gathering these berries, and from them is obtained a beautiful green wax, which burns very nearly, if not fully, as well as the spermaceti, or composition candles. The method of procuring this wax is by boiling the berries in a copper or brass vessel for some time. Iron pots are found to darken and cloud the wax. The vessel after a sufficient time is taken from the fire, and when cool the hardened wax, floating on the top of the water, is skimmed off.

MYRICA CORDIFOLIA. The wax tree of Louisiana contains immense quantities of wax. According to the experiments of M. Cadet and Dr. Bostok, myrtle wax differs in many respects from bees' wax. Specimens of it assume shades of a yellowish green color. Its smell is also different; myrtle wax, when fresh, emitting a fragrant balsamic odor. It has in part the unctuousity of bees' wax, and somewhat of the brittleness of resin. Its specific gravity is greater, inasmuch that it sinks in water, whereas bees' wax floats upon it; and it is not so easily bleached to form white wax. The wax of the *Myrica cordifolia* of the Cape, is used for candles.—*Simmonds. O'Shaughnessy, Bengal Dispensatory* p. 612.

MYRICA GERMANICA.—Desf.

Bia.	JHELAM.	Kathi,	CHENAB,
Shalikal,	KANGRA,	Humbu,	SUTLEJ,
Hambukh,	"	Joaraktse,	LADAK

Not uncommon in various parts of the basins of the Jhelam, Chenab, and Sutlej, and in Spiti and Ladak, from 6,000 to over 16,000 feet.—*J. L. Stewart, M. D.*

MYRICA INTEGRIFOLIA. Roxburgh *Fl. Ind.* iii. p. 765, from the N. E. frontier, and Khassya mountains seems to be different from *M. sapida*, its fruit is acid and used for pickling.—*O'Shaughnessy*, p. 611.

MYRICA SAPIDA.—Wall.

Box-myrtle,	ENG	Kai-phal,	HIND.
Kai-daryamu,	TEL.	Kahikahela?	"

This tree occurs in different parts of the Himalaya from the Sutlej to Nepal and Silhet; fruit agreeably flavoured. The same,

MYRISTICACEÆ.

or a nearly allied species, is found in China and Japan, in the Sutlej valley between Rampur and Sungnam. Fruit used for making sherbet. The fruit is edible, with a sweetish bitter taste: it ripens in June. In the Himalaya it is generally met with at an altitude of from 4,000 to 6,000 feet, and its bark is exported to the plains as a dyo and as medicine. On the lower Sutlej, it is common and a few trees may be seen at from 3,200 to 6,000 feet up to the Ravi. The bark is aromatic and stimulant, and a favourite native medicine. The fruit has not much flesh, but is a pleasant sour sweet. It is mostly used in sherbets. The bark is official in the plains, being considered hot, and given in rheumatism, and mixed in plaster.—*Dr. J. L. Stewart, M. D. Powell's Handbook*, vol. i. p. 314. *Oleghorn Panjab Rep.* p. 65.—*Hogg. Vegetable Kingdom*.

MYRICARIA ELEGANS, Royle.

Humbu, umbu, of Sutlej, and Ladak.

This is one of the Tamariscinæ. Dr. Stewart found it at 9,000 feet sparingly on the Sutlej, and it grows from 10,000 feet on the Upper chenab to 15,000 in Ladak. The leaves are often covered with a saline efflorescence; in Lahoul its leaves are applied to bruises, &c. The twigs are in Ladak browsed by sheep and goats.

MYRICARIA HERBACEA, a plant of the Tamaricaceæ, growing in Mongolia.

MYRIOGYNE MINUTA.—Less.

Cotula minuta Forst Willd.	Artemisia minima
" cuneifolia, Willd.	Thunb. not L.

" decumbens Desf.	

Nak-chikni, HIND.

India and Madagascar to Japan and New Holland. Considered by natives a hot and dry medicine useful in paralysis, pains in joints, and special diseases, also as a vermifuge. It promotes sneezing, hence its vernacular name.—*Roxb. iii.* 423. *Powell's Hand-book*, vol. i. p. 358. *Voiyt* p. 420.

MYRIOPHYLLUM VERTICILLATUM. Linn.

Punatsu, TEL.

A small aquatic plant, the flowers of which become detached and swim on the surface of the water. Sugar refiners cover their moist sugar with the plant, as clay is used in the West Indies. See Haloragaceæ.

MYRIOPODA, one of these, the Craspedosoma vagabunda, inhabits China.—*Adams* p. 95.

MYRISTICACEÆ, Lindl. The nutmeg tribe of plants, are trees often yielding a red juice, and arranged under their genera,

MYRISTICA CINEREA.

Myristica, *L.*, *Virola*, *Aubl.*, and *Knema*, *Lour.* These contain 48 species. The genus *Myristica* numbers 46 species, 29 inhabiting the Moluccas, Cochin, China, Java, Ceylon, and the ultra-gangetic Peninsula of India; 4, the intra-gangetic Peninsula of India; 3, S. America; 2, Madagascar; 1, Aleppo; 1, Mauritius; 2, Chittagong; 2, the Khasya Mountains; and 2 New Holland. The Nutmeg of the shops, which is the seed of *M. officinalis*, is the only product of the order employed officially. Other species bear fruit that may be employed as a substitute, but they are all inferior to the real oriental *Myristica*. The species of the E. Indies are as under:

Myristica moschata, *Thunb.*, Moluccas.
M. Horsfieldii, *Sprenger.*, Ceylon, Java.
M. tomentosa, *Thunb.*, Moluccas, Malabar.
M. peltata, *Rozb.*, Moluccas.

Jae-putri,	DUK.		

A tree with small, pale yellow, and inodorous flowers, successfully cultivated in Sumatra, Bencoolen, and Penang. The girth is 6 to 10 inches, a foot above the ground. It branches like the laurel and its loftiest sprays are frequently fifty feet high. The fruit when ripening resembles a peach, and on removing the epicarp or fleshy outer rind, is a spherical nut, black, clasped by a fine branching aril, of a vermilion colour, which is the mace of commerce. When ripe the fruit is picked, the outer part removed, the mace taken off and dried in shallow baskets in the sun. The nut contains a volatile, as well as a fixed oil. The wood is said to be hard and close grained, the culture of the nutmeg tree has been successfully commenced both at Mergui and Maulmain. Behind the hill at Maulmain, the trees appear to thrive; and at Mergui the trees were thriving. Nutmeg butter is prepared by beating up the nutmegs, enclosing the paste in a bag and exposing it to the vapour of water, and afterwards expressing the fat by means of heated plates. The nutmeg tree is monœcious as well as dioecious, but no means exist of discovering the sexes, before the period of inflorescence, is known. Upon an average, the nutmeg tree fruits at the age of seven years, and increases in produce till the fifteenth year, and is said to continue prolific for sixty or eighty years. Seven months in general elapse between the appearance of the blossom and the ripening of the fruit: and the produce of one bearing tree with another, under good cultivation, in the

MYRISTICA MOSCHATA.

fifteenth year, may be calculated at five pounds of nutmegs, and a pound and a quarter of mace. It bears all the year round, but more plentifully in some months than others, and generally yields more abundantly every other year. It is necessary that the roots of the trees during their growth should be kept well covered with mould, for they have a tendency to seek the surface. The growth of the lateral branches is to be alone encouraged, and all suckers, or dead and unproductive branches, are to be removed with the pruning knife, and the lower shoots lopped off, with the view of establishing an unimpeded circulation of air."

The *arillus* or mace is thick, between horny and fleshy, much lacerated, folded and anastomosing towards the extremity, almost enveloping the nut; when fresh, brilliant scarlet, when dry, more horny, yellowish brown and brittle. The smell and taste of the *arillus* are peculiarly fragrant and agreeable. It softens, but does not dissolve in the mouth. Beneath the *arillus* is found a bony shell, which covers the almond or kernel; this shell is thin, hard, brittle, brown and shining above, pale grey within, insipid and inodorous and encloses the nutmeg of commerce.

The *kernel* is large, rounded, obtuse at both ends, the size of a small myrobalan nut, smooth, marked with reticulated chinks, those transversely placed being less evident than the longitudinal; grey externally. In the chinks occurs a whitish powder, apparently chalk; internally the almond is traversed by branching, reddish, irregular greasy veins, giving it a marble appearance. The nut is hard and easily cut, scraped, or grated, very inflammable, but the smoke is devoid of the fragrance of the acid. The odour of the nutmeg is most agreeably aromatic: its taste hot, and analogous to the smell. The nut readily divides under the teeth, and is partially soluble in the saliva. Nutmegs are much injured by time, becoming the prey of insects, which perforate them in every direction; sometimes good nutmegs are adulterated with others from which the valuable principles have been extracted by alcohol. Worm-eaten nuts are also fraudulently repaired by the introduction of a paste of flour and nutmeg oil into the holes.

The *Essential Oil of Nutmegs* is white, lighter than water, acrid, pungent taste, and very powerful nutmeg odour.

The *Fixed Oil, or Butter of Nutmegs* occurs in the commerce of Europe in flattened masses, of square form, yellowish, solid, internally marbled, 500 parts containing about 50 of essential oil. This substance is much adulterated, particularly with suet, spec-

MYRISTICA OTOBA.

maceti, marrow, wax, the oil of the *Moringa pterygosperma* coloured with alkanet or rocou, &c., &c. The fixed oil is obtained by bruising the nutmegs into a paste, which is compressed in bags between hot metallic plates. Two kinds are found in commerce—one in small earthen pots, of mace colour, and very agreeable smell, is exported from the Moluccas, to Holland, chiefly; the second kind is obtained from Holland, occurs in flat cakes, is far inferior to the first, and is usually adulterated with spermaceti. The chief use of nutmegs is as a spice, and for the preparation of perfumes and scented soaps. The tree, according to M. Fee, was altogether unknown to the ancients, and *Капуанов* of Theophrastus and the *Cinnamomum* of Pliny have been erroneously regarded as identical with this. Avicenna seems to have been the first who described it under the name "Jauzboa." The tree itself, however, has only been identified clearly within the last few years. The nutmeg tree is chiefly cultivated in the Banda islands, but plantations are now numerous at the Mauritius, Bourbon, Cayenne, Martinique, and in the English possessions to the Eastward, especially in Province Wellesley, Penang, and also in the Tinnevely district of Southern India. The natives of the Moluccas gather the nutmeg fruit by the hand, strip off and reject the pulpy pericarp, detach the mace carefully, and expose it to the sun, which soon changes its blood-red colour to a light brown, it is then sprinkled with sea-water to render it flexible, and to preserve it. The nuts are first sun-dried, and then smoked, until the kernel rattles against the shell. This envelope is then broken, and the kernels dipped twice or thrice in lime-water. They are then heaped together for two or three days, wiped, and packed in bales or barrels. The nutmegs thus prepared have been long termed, "female," or "cultivated," in commerce, to distinguish them from a kind named the "wild" or male, which is less esteemed, and seldom found in European trade.—*Bikmore* 223. *Penang Gazette. Riddell. O'Shaughnessy*, pp 535, 536. *Ainslie's Mat. Med.*, p. 264. *Royle Mat. Med. McCulloch's Commercial Dict.* p. 852. See Nutmeg.

MYRISTICA OTOBA.

Virola sebifera, Lamarck. | *Myristica sebifera*, S. Fe.

A large tree of Cayenne and Guiana yields aromatic nuts which when boiled with water give out a large quantity of a fixed oil, used for making candles. An acrid juice also exudes from incisions in the bark, and is employed as a popular medicine.—*O'Shaughnessy*, p. 537.

MYRMELEON GRAVIS.

MYRISTICA PARVIFLORA. *Roxb.* A tree of the Moluccas.

MYRISTICA PELTATA. *Roxb.* F. I. iii, 846 Mountains of the Moluccas.

MYRISTICA SPICATA. *Roxb.* A tree of the Moluccas. No part of the tree possesses any fragrance.—*Roxb. Fl. ind.* 3, p. 847.

MYRISTICA SPHÆROCARPA.—*Wall.*

Ky-wai-thwu, Burm.

A plant of Martaban.—*Wall. Pl. As. rar.*, p. 895.

MYRISTICA SPURIA, its fruit, in the Archipelago, is substituted for the true nutmeg.

MYRISTICA SYLVESTRIS, *Telf.* A plant of the Mauritius.

MYRISTICA, TOMENTOSA *Thunb. Spreng.* p. 65; *J. Grak. Cat. B. pl.* p. 175.

M. matabarica, *Lam.* | Male nutmeg tree, *Eng.*

A tree of the Moluccas, Malabar, S. Ceylon. Small yellowish flowers.

The fruit is downy, its substance fleshy, more solid, and firm. The kernel is covered by a hard shell provided with a pale arillus, the kernel is $1\frac{1}{2}$ to 2 inches long, elliptical, the parenchyme devoid of marbling. Its odour is weak, flavour disagreeable. The mace of this nutmeg is distinguished from the true mace by being formed of three or four regular bands united at the summit. The chemical composition of the article is analogous to that of the true nutmeg, but the oils are so inferior in proportion, that the "male" nutmeg is but of little commercial value in Penang, its fruit is used as a substitute for the true nutmeg.—*O'Shaughnessy*, p. 537.

MYRMELEON GRAVIS, *Walker*, one of the ant-lions of India whose larvæ have earned a bad renown from their predaceous ingenuity. Ceylon has, at least, four species, which seem peculiar to the island, viz., *Palpares contrarius*, *Walker*, *Myrmeleon gravis*, *Walker*, *M. dirus*, *Walker*, *M. barbarus*, *Walker*. The form of the larvæ at the lower part resembles that of a spider, but the head is armed with a sharp strong pair of claws. They excavate, in fields, gardens and roadways, small cup shaped cavities, with exquisitely smooth edges and sides, at the bottom of which they lurk, so that any insect approaching near, immediately falls below to the ambush and is seized and destroyed. Their excavations are usually carried on at night, but in the

MYRMICIDES.

process they throw up the sand and gravel to a considerable height, the soil around their cups is very level. They often throw up a particle of sand towards any adhering insect, which, by moving the mass, brings down the insect with it. One of the large black ants was seen to fall into one of the cups, and was seized by the ant lion, but its comrades adhered to the captive to release it.—*Walker in Tennent's Sketches of the Nat. Hist. of Ceylon*, p. 411.

MYRMICIDES. A tribe of insects comprising the ants.

The genus *Atta*, comprises 6 species of ants, all of small size, having a sting, two knots in the first segment of the abdomen, antennæ not concealed in a cleft, thorax without spines, and short palpi.

Atta minuta, *Jerdon*. Worker, barely 1-12th of an inch long, head oblong. This minute species makes a temporary nest in various situations, in any empty box, between the back of a book and its leaves, even among the loose pages of a book, in an empty shell, &c. &c. Nothing is used in its construction, a shelter from the light merely being sought for. It is perhaps not very numerous in individuals, one wingless female is generally found in the nest. It is very common in the Carnatic and most parts of India, but not seen in Malabar. It appears to prefer dead animal matter to saccharine or vegetable products.

Atta destructor, *Jerdon*. Worker, about 1-10th of an inch long, head oblong, not so long in proportion as in the last; eyes small, colour rufous, abdomen glossy brown. They live in holes in the ground, or in walls, &c., and are very numerous in individuals. They prefer animal to vegetable substances, destroying dead insects, bird skins, &c. &c., but also feed greedily on sugar. They are common in all parts of India, and often prove very troublesome and destructive to the naturalist.

Atta domicola, *Jerdon*. Worker, about 1-6th of an inch long, head oblong; eyes moderate size, head, thorax, and legs, deep red brown, abdomen blackish. This species of ant does not seem to be common, only hitherto procured at Nellore in a hole in a house and only one kind of individual seen.

Atta rufa, *Jerdon*. Worker, 1-8th to 1-6th of an inch long, head short, oblong; eyes rather small, medial; of an uniform glossy rufous colour, with the end of the abdomen somewhat darker. Warrior variable, about $\frac{1}{4}$ th inch long, head large, very square. Female about 7-24th of an inch long. It is very

MYRMICIDES.

common in Malabar, also found in the Carnatic: in holes under ground, about gravel walks, mud walls, and often appears in houses, coming through a hole or crevice in the floor, or wall. From a colony of them, every now and then, vast numbers of winged females, (and males) issue forth just before sunset attended as far as the window by swarms of the neuters of both kinds. Its favorite food is dead insects and other matter, but it also carries off seeds, chaff, &c. &c. like the *Ocodoma*. It stings very severely, leaving a burning pain that lasts for several minutes.

Atta dissimilis, *Jerdon*. About 1-10th of an inch long, head oblong, abdomen long, oval, colour blackish throughout. This ant is found in small numbers on trees in Malabar.

Gen. *Myrmica*. Antennæ sufficiently exposed; head triangular, without spines; maxillary palpi long, of six joints; jaws triangular; three cubital cells in the upper wings, the third incomplete, &c.

Myrmica diffusa, *Jerdon*. Worker, rather more than 1-9th inch long; head and body rufous; abdomen dark glossy brown. Female—length 5-12th of an inch wings not so long as abdomen. Male—; head very small, eyes large; length 1-7th of an inch found throughout India. It makes its nest in holes in branches of trees, runs with its abdomen turned upwards almost over its head, especially when excited, and feeds on honey and other vegetable secretions. Occasionally they appear to form their nest among the roots of moss, orchides, and various epiphytic plants; at least this is the case in Malabar. It is very pugnacious, and bites very severely, not appearing to use its sting much.

Myrmica rufa, *Jerdon*. Worker, length 9-48th of an inch, entirely of a rufous colour. This is a very closely allied species, and is found in the same localities as the last. Its habits are similar.

Myrmica Kirbyi, *Sykes*? Head, thorax and legs dark maroon; abdomen dark brown. Length 7-48th of an inch; found chiefly in the elevated forests of the Wynad. It forms a considerable nest of some papyraceous-materials, usually of an oval form, and placed round a small branch which supports it. It is very numerous in individuals, countless swarms issuing from it on being disturbed and boldly attacking the assailants both with teeth and sting. It feeds on honey or flowers and other vegetable secretions. The nests are built on different kinds of trees and shrubs; the *Syzygium jambolana*, *Coffea Arabica*, *Psidium*

MYRMICIDES.

pomiferum, *Citrus aurantium*, &c. A nest taken from a *Syzygium jambolana* at Nagalore, Shervaroy Hills, weighed 3lbs. 8oz., irregularly oval in form, extreme length 19½ inches, girth or circumference in the centre, 32½ inches, and sufficiently solid to withstand moderate force. The nest was situated about 30 feet from the ground, on a fork of the tree, and was built round some of the branches, which protruded through it in various directions; the girth of the thickest or lowermost branch of the fork measured 1½ inch; all the other branches that protruded through the nest were much smaller. The structure was made up of a fine mixture of cowdung and leaves of various kinds; but the outside was well smeared with cowdung, and honeycombed with tile-like appendages, which, whilst they permitted the free ventilation of the interior, at the same time, by a slight projection of the scale-like leaves, rendered the nest impervious to rain. These diminutive creatures put on, threatening attitudes with their abdomens flexed over their back or thorax, and their mandibles extended. They ran to and fro in a state of excitement in search of the enemy, on whom, when found, they at once advanced, and used their expanded jaws to such purpose as to cause extreme pain to the individual attacked. Considering their small size, the ferocity and undaunted courage they exhibited, and their readiness to attack man or beast who approached them were very remarkable. A battle had taken place between the inhabitants of two nests; numbers even in death clinging to each other: and the survivors were but few in number. The victors were already busily engaged in plundering the nest of the vanquished of its cocoons, and carrying them off to their own.

Myrmica fodicus, *Jerdon*. Worker, length 4-12th of an inch; head, thorax, legs and abdominal pedicles maroon colour, abdomen shining brown. Female, head rather smaller proportionally. This is one of the most common and abundant ants in Malabar, not seen in the Carnatic. It seldom enters houses, it otherwise appears to take the place of *Formica indefessa*, which is not found in Malabar. It feeds chiefly on honey and other vegetable secretions, but also will take dead animal matter. It is also found in the train of caterpillars feeding on leaves. It makes large excavations under ground, generally having the entrance round the trunk of a tree, and it forms considerable heaps of fine earth round the mouth of the nest. It runs with its abdomen turned downwards under the abdominal pedicles.

Myrmica tarda, *Jerdon*. Worker, length

MYROBOLON.

1-6th of an inch; head, thorax, legs abdominal pedicels, brick red; abdomen dusky, dark blue. This very curious looking ant, is found both in the Carnatic and Malabar, lives in holes in the ground in small societies, and feeds on vegetable secretions. It moves very slowly.

Myrmica cosca, Jerdon. *Ocodoma*? Worker, length 1-5th of an inch; head, thorax, and legs reddish brown; abdomen glossy brown; found once under a stone in the Wynaad.—*Dr. Jerdon in Madras Lit. Society's Journal. A brief account of the Myrmica Kirbii as found in Southern India, By John Shortt M. D., F. L. S. in Linnean.*

MYROBOLON, also myrabolan and myrabalan. The substances known by this name are the fruits of several East Indian trees, and are used in India as substitutes for galls. When ripe, the fruit is pear shaped, deeply wrinkled, of a brownish, yellow colour, and weighs from 70 to 100 grains. The husk contains the whole of the astringent matter, some mucilage, and a brownish yellow colouring substance, which is used in India for dyeing yellow. The husk is usually separated by bruising the nut, which it encloses. The tannin of myrobalans differs slightly from that of galls. Gallic acid is present in rather large proportion. The price of myrobalans in June 1852 was quoted at from 5l. to 10l. per ton; 8s. to 12s. the cwt. Six kinds of Chebulic myrobalans all known as Helleh are used in India Helleh-Zira, the fruit is dried when just formed, and the size of a cummin seed or Zira. H-i-Jawi, the fruit dried when the size of a jao, or barley-corn. H-i-Zingi, the fruit dried when of a larger size and black like a negro. H-i-Chini, larger than H-i-Zingi, and greenish. H-i-Asfar, the fruit near maturity and yellow (Asfar). H-i-Kabuli, the fruit at full maturity. Mature Cabul myrobalans sell for a rupee a piece in the Bombay market, under the name of Sarwar-i-Hindi.

The Unguent corn or Myrobalan of Pliny, the *Salaavos* of Theophrastus and the Greeks referred to a species of Moringa, probably *M. aptera* of Africa and Arabia, though *M. pterygosperma* has been named.

The Myrobalans of commerce yielded by the *Terminalia chebula*, *T. belerica* and *T. citrina* are called also gallnuts and are oval fruits of a dingy yellow colour, containing much tannin; hence, they are useful to the tanner as well as to the dyer. With alum, this fruit yields a good durable yellow; and with salts of iron, a black colour, little inferior to that produced by oak galls. The myrobalans although a very common dyeing

MYROBOLON.

and tanning material of India from time immemorial, have not been many years introduced into European commerce, but so useful have they been found, that, by the year 1852, they had become a very important article of trade, and the consumption rose to fully 2,000 tons annually. On this subject, the Canara Local Committee, writing in 1855, observed as follows:—"During the last season a sudden demand arose for the gallnut, (myrobalan) and large profits were made by the persons who collected it from the jungles. The exports for five years had been as follows:—"

Fusly 1256....	Candies. 207	Mds. 3	Ra. 918
1260....	380	16	1,877.
1261....	537	19	2,860
1262....	530	17	2,614
1263....	2,154	4	3,029

In 1853-4 the exports from Madras were 4145 cwt. value Rs. 8,447.

All the three myrobalon trees are to be met with throughout India. In Bengal they grow in abundance. In Java, we are told by Buntius, that the Dutch were in the habit of employing the emblic and beleric sorts daily in their hospitals, in dysenteric, and bilious affections.

Har or Harra, from *Terminalia chebula* and other species, three in number, comprise all the discarded myrobalans of the old pharmacopæas.

The myrobalans as brought into Cashmere from Delhue and Harowtee, Hindustan and the Dukhan, are of four kinds namely,

Gural harra.—Astringent and purgative: used in mesalish: given in medicine to children: four seers for one rupee.

Jawal harra.—Used in the same way: eight seers for one rupee.

Chaipeh harra, used only in dyeing, ten seers for one rupee. The whole are much used in dyeing. According to the size of the myrobalan its value augments, so that a very large one may be worth one hundred rupees or more, the natives believing that the very large ones have the virtue of causing purging by being merely retained in the hands. The *Har or Harra*, says Dr. Irvine, is one among the articles of the native *materia medica* than which no one is more vaunted. It is considered to possess wonderful general deobstruent and purgative qualities, &c., &c., while those who thus belaud it, are apparently not aware that this is the chebulic myrobalan (*Terminalia chebula*) of English pharmacopæias of the sixteenth century and long since deservedly

MYROBOLON, CHEBULIC.

neglected.—*Archer. Tomlinson. M. F. J. R. Ainslie. Gen. Med. Top. pp. 136, 153. Poole Statistics of Commerce.*

MYROBOLON, BELLERIC.

Myrobolanus taria, Buch.	Tani,	Rheede
Beyleluj,	AR. Kudondong	MALAY.
A-mo-loh-kia-kwo	CHIN. Belclah, Beylelaj,	PERS.
Bella,	DEK. Behira, Vibtaka,	SANS.
Behoyra, Bida,	HIND. Boloos; Bulu,	SINGH.
Malaku,	HIND. Tanikui,	TAM.

The belleric myrobolon, is the fruit of the *Terminalia bellerica*: in its dried state, is little larger than a gall-nut, but not so regular in shape, of a dirty brown colour, and astringent taste. It is supposed to be similar in its properties to the chebulic myrobolon, but in a much weaker degree. It is much used in India as the basis of several colours, and also in medicine. Small quantities have of late years been exported from Bombay to Britain. This article is sometimes used by the natives in its dried state in cases requiring slight astringents. The large tree which produces it is common in Mysore, where it is called Tari.—*Faulkner. Ainslie's Mat. Med. p. 28. Mason.*

MYROBOLON, BLACK, or INDIAN.

Holeclaj aswad,	ARAB. Holeclah seeb,	PERS.
Zengi-har,	BENG. Kurkadaga,	SANS.
Hemuz, Hemuj	Guz. HIND. Smbgi,	TAM.

Is the muripe dried fruit of the *Terminalia chebula*. It is about the size of a pistachio nut and of a deep black colour, oblong, pointed at both ends, slender, and has scarcely the rudiment of the nut. It is used by the natives of India as a brisk purge; and also as a dye. In Bengal and in most parts of the Western Presidency, they are grown in abundance. They are largely exported from Bombay to the Arabian and Persian Gulfs.—*McCulloch Com. Dict. Faulkner.*

MYROBOLON, CHEBULIC.

Heliluj Kabuli,	AR. Harcla Har,	HIND.
A-mo-loh-kia-kwo,	CHIN. Helilah,	PERS.
Huldah,	DEK. Haritaka,	SANS.
Chebolic myrobolan,	ENG. Aralu,	SINGH.
Country galls,	.. Kadukai,	TAM.
Humbether, Guz. HIND.	Cara-kaia,	TFL.

This is the fruit of the *Terminalia chebula*. In its dried state, it is about the size of a large Spanish olive, of an oblong ovate shape, yellow brown colour, and is marked with edges and furrows alternately. The tree is common in the Mysore country, Bengal, and in some parts of the Western Presidency. This fruit is very astringent and is extensively used by the natives of India in their arts and manufactures. They are ex-

MYROLE.

ported from Bombay to London and Liverpool in large quantities; it is more astringent than the Aleppo galls. This myrobolon well rubbed in conjunction with galls and catechu is considered by the Vyteans as an excellent external application in the aphthous affections of children, and adults.—*McCulloch. Faulkner. Ainslie's Mat. Med. See Dyes.*

MYROBOLON, CITRINE.

Harra,	Guz. Alay gara,	TAM.
Liba,	SANS.	

The citrine myrobolan, of the *Myrobolanus citrina* or *Terminalia citrina* which grows in Canara is about the size of a French plum, is often made into pickle, and when green, is used as a gentle purgative. It is frequently met with in most parts of lower India.—*Ainslie.*

MYROBOLON, EMBLIC.

Amulj,	AR. Amla, Anvelcutty, Di K.	
Amla; Anola,	BENG. Aunwera,	Guz.
Cay-houng-Ngot,	Coch. Amla; Anola,	HIND.
	CHIN. Buah-Malaka,	MALAY.
Hac-min-sou,	.. Amleh; Amuleh,	PERS.
Amla, Amlej,	DEK. Amalaka, Amrita,	SANS.
Phyllanthus emblica,	LAT. Awusdanelli,	SINGH.
Emblia officinalis,	.. Nelli kai,	TAM.
Phyllanthus, Wushmi kaia,	TFL.

This is the fruit of the *Phyllanthus emblica*, *Linn*, in its dried state, it is about the size of a small marble, of a dirty, dark-brown colour, and irregular surface, possessing a considerable degree of astringency. It is to be met with in most parts of India in its green state, it is frequently made into preserve and pickle; it is also with other articles of similar qualities, made into a cooling and opening pisan. The tree which produces this article is the Nilica maram of the Hort. Mal. and the Boa Malacca of the Malays.—*Faulkner. Ains. Mat. Med. p. 29.*

MYROBALANUS BELLERICA, *Brogn.*
Syn. of *Terminalia bellerica*, *Roxb.*

MYROBALANUS of Pliny, the Unguent corn is supposed to be the seed of the *Moringa aptera*.

MYROBALANUS CHEBULUS, *Wesling*, is the Egleg of the Egyptians and Arabs, quite distinct from the true Chebulic myrobolan.—*Birdie.*

MYROBALANUS EMBLICA, *Bauhin.*
Syn. of *Emblia officinalis*.—*Garten.*

MYROLE or **Mirole**, TAM. MALAY. a Malabar wood, of much value, but scarce. It is very heavy and strong, and grows to about twelve inches in diameter, and fifteen or twenty feet high. It is generally used where strength and durability are required.—*Edye. Mal. and Can.*

MYRRH.

MYRRH. See Hydridae.

MYROSPERMUM, a genus of plants belonging to the natural order Amyridaceæ. The species are trees with dotted leaves.

MYROSPERMUM PERUIFERUM.

Myroxylon peruiferum, Linn.

This tree of Central America is supposed to yield the Balsam of Peru. The article known in commerce as White Balsam, or myrrh seed or quinquino is made from this tree and from *M. pubescens*. The stem has a thick smooth straight trunk with a gray coarse bark, which is filled with resin. This, by distillation with water, yields a volatile oil; by exposure to the air it hardens, and it is then termed *Opobalsamum Siccum*. The true *Opobalsamum* and Balsam of Tolu is also sometimes called *Opobalsamum*.—*Eng. Cyc.*

MYROSPERMUM TOLUIFERUM, balsam of tolu.

The myrrh of commerce is believed to be produced from several trees, *Balsamodendron gileadense Knuth*, the Balsam of Bruce and a synonym of *Amyris opobalsamum*, Forskal, and of *Balsamodendron opobalsamum*.

The *Balsamodendron myrrha* of Ners, the Karbeta of the natives, seemingly identical with *B. Kua* of Mr. Brown's MSS.

Myrrh is mentioned in Gen. xxxvii v. 25, and in Exod. xxx. 23, by the name of Mor or Mur. The Greeks called it *μυρρα*, and also *Σμυρρα*. Herodotus mentions it as produced in the south with Frankincense, &c. Dioscorides states the variety called *Troglodytica* to be the best. In the *Periplus* of the Red Sea, Arrian mentions myrrh with olibanum as exported from the coast of Barbaria, that is, the modern Berbera. Bruce learnt that it as well as Frankincense, was produced, in the country behind Azab, or in that of the Dankali. The embassy to Abyssinia under Major Harris met with it on the hills, in the comparatively flat country which extends from Abyssinia to the Red Sea, near the Straits of Bab-el-Mandeb, or from the Doomi Valley to the

MYRRH.

banks of the Hawash. Mr. Johnston (Trav. i. p. 249) met with it in nearly the same locality. Both authors describe the myrrh as exuding from wounds made in the bark, and say that it is collected in January and March, but chiefly in July and August, and in small quantities at other times of the year and exchanged for tobacco with the merchants who proceed to Berbera, &c., whence it is exported to the coast of Arabia.

Myrrh reaches Europe chiefly from Bombay, having been imported there from the Arabian and Persian G-ffs. It used formerly to be obtained also from Turkey. Ehrenberg and Memrich found a small tree in Arabia near Gison, on the borders of Arabia Felix, from off which they collected some very fine myrrh.

The Balsam of Bruce was found by him at Azab, and said to extend to the Straits of Bab-el-Mandeb. Gerloch found it at Bederhumin, a village between Mecca and Medina. Forskal found his *Opobalsamum* at Hues in Arabia Felix. At Aden it is called Beshan. Dr. Roth, in the Appendix to Harris' Abyssinia (ii. p. 144) mentions *B. Opobalsamum* as occurring in the Adel country and the jungles of the Hawash along with the Myrrh tree. The bark when wounded exudes the fragrant Balm of Gilead balsam, which seems to have been cultivated in Palestine near the town of Jericho. It is no doubt possessed of stimulant properties.

Balsamodendron myrrha. Dr. Ehrenberg collected from off this tree very fine myrrh on the borders of Arabia Felix. It is stated in the Appendix to Harris' Abyssinia (ii. 414.) that the "*Balsamodendron myrrha* (Karbeta of the natives) grows on the borders of Elat and in the jungle of the Hawash, and in the Adel desert. The resinous gum called Hofali is collected for exportation.

B. Opobalsamum (Beshan) grows commonly with the former, and grows even at Cape Aden."

Mr. Johnston, says "there are in the country of Adel two varieties, one a low, thorny, ragged-looking tree, with bright green leaves, trifoliate, and an undulating edge, is that which has been described by Ehrenberg. This produces the finest kind of Myrrh in our shops. This may be either *B. Myrrha* or one of the forms of *B. Opobalsamum*. The other is a more leafy tree, with the appearance of the hawthorn, having the same largely serrated, dark-green leaves, growing in bunches of four or five, springing by several leaf-stalks from a common centre. The

MYRRH.

flowers are small, of a light-green colour, hanging in pairs beneath the leaves. The fruit when ripe easily throws off the dry shell in two pieces, and the two seeds it contains escape. The outer bark is thin, transparent, and easily detached; the inner, thick, woody. When wounded, a yellow turbid fluid (the gum-myrrh) immediately makes its appearance. Naturally, the gum exudes from cracks in the bark of the trunk near the root, and flows freely upon the stones immediately underneath. Artificially, it is obtained by bruising made with stones."

Balsamodendron Africanum Arnott.—*Hendelotia africana*, Guill. et. Per. first found on the west of Africa, occurs also in the Abyssinian collection, having been found in the flat country of the Adel. Mr. Johnston immediately recognized it as one of the trees yielding gum-resin. The leaflets are like those of *B. Kna*, Br. It yields African Bdellium, or that imported into France from Guinea and the Senegal, according to M. Porrottet. M. Adanson mentions it by the Senegal name of Niotout as producing Bdellium. It may also yield the Bdellium which is exported from the west coast of Africa. Dr. Malcolmson wrote to Dr. Royle that "bdellium is produced in Africa by a tree similar to the myrtle; none is obtained in Arabia, it is very similar to myrrh, and sometimes sold for it."

One kind of bdellium is produced in India, which Dr. Royle was informed is yielded by a tree called googul by the natives and which is the *Amyris commiphora* Roeb. referred by Messrs. Wight and Arnott to *Balsamodendron*. Dr. Walker, in his account of the drugs produced near Aurungabad, states "a gum-resin, called by the natives googool, is produced by a tree (Dr. W. calls it *Amyris bdellium* P. Roeb.) which grows in the neighbourhood of Umer. a town twenty miles to the westward of Aurungabad. Roxburgh imagined that Googool was identical with Myrrh."

Myrrh is generally in pieces of irregular form and size, formed apparently by agglutinated tears, dry, and covered with a fine dust, commonly of a reddish-brown colour; brittle, fracture irregular, conchoidal, shining with the surface apparently dotted with volatile oil, often varied, with opaque, whitish, semicircular marks; the smaller pieces angular shining, semi-transparent; taste bitter and aromatic, the smell peculiar and balsamic. Specimens brought by the Abyssinian embassy have granular fragments mixed with roundish tears; and some of a pale, even whitish, colour may be seen on

MYRRHE.

the same piece of bark with ordinary coloured myrrh. Specimens which have not been exposed to the air, are darker coloured, moister, and of a more powerful and agreeable smell.

Indian Bdellium is sometimes sold for and considered as an inferior kind of myrrh. It is in roundish pieces of a dull dark-red colour, more moist than myrrh, and not brittle like it, softening even with the heat of the hand; bitter and a little acrid in taste, with a less agreeable odour. It often has portions of the birch-like bark adhering to it.

The sort met with in India, and brought from the Arabian and African coasts, is in large opaque pieces, generally covered with a brownish white powder. An inferior kind of myrrh, termed in India Bysabole, is also imported from the above places. It has a great resemblance to bdellium, for which it is not unfrequently mistaken. Myrrh is largely imported into Bombay, and is chiefly re-exported to England. Myrrh has long been in repute in low fevers in Europe, and occasionally in agues, Dr. Kirk found it very useful in the typhoid state which in India is frequently the second stage of paroxysmal fever and also in the low adynamic fever of jails. In Arabia there is an inferior kind called "baisa bol," or "hebbakhade," by the Somali. Pliny says, that in his time six different kinds of myrrh grow in Arabia, he says myrrh was often adulterated with mastix. In India, there is a substance having the closest resemblance to myrrh which is imported into and known in Europe as Indian myrrh. This is also said very closely to resemble, if indeed it at all differs from, bdellium; it is probable, therefore, that it is what in India is known by the name of googul (moogl of the Arabians), as it forms the bdellium of commerce, and resembles an inferior kind of myrrh, as indeed bdellium is frequently described to be. That it is also the bdellium of the ancients would appear from the Persian authors giving bulleyoon and madikoon as the Greek name of moogl. Turkey myrrh is considered the finest, the East Indian being the second in quality, it is employed medicinally, as a dentifrice, and in the preparation of fumigating pastiles.—*McCulloch. Fnullner. MYRTUS COMMUNIS.

phyllus aromaticus; and allspice is the dried berries of *Eugenia pimenta*, plants belonging to the same section of the Myrtaceæ as the common myrtle; the aromatic fruits of the myrtle were indeed used as a spice before cloves and allspice became common. *Punica granatum*, the pomegranate tree, is remarkable for an almost total absence of aromatic qualities and distended so much after the flower has fallen off, that the fruit is nothing but a collection of cavities filled with seeds, and having no apparent relation to each other.

Calyptanthus caryophyllata, is a native of Jamaica, Cuba, and Ceylon. The bark is compact, very hard but brittle, found in commerce in sticks composed of pieces rolled one within the other, of deep brown colour, and greyish white epidermis; the odour is strongly that of the clove, taste aromatic, hot and sharp, slightly bitter and astringent. It contains tannic acid, resin, and essential oil, and is employed chiefly as a spice.

Caryophyllus aromaticus, the clove-tree, is a native of the Molucca Islands. It is a moderately sized tree. The cloves of the shops are the dried compressed flower-buds. — *Roxb. Fl. Indica Voigt. O'Shaughnessy Bengal Dispensatory* p. 334. *Hogg. Vegetable Kingdom*.

The myrtle is a native of Asia Minor and south of Europe, it assumes the shrubby or arborescent form according to the latitude. The plant in all its parts is most agreeably perfumed. 10 lbs. of the leaves afford about a drachm of yellow essential oil of most delightful fragrance. The berries were employed by the Romans as a spice. The Tuscaus still use them and they also prepare from the berries a kind of wine called *Myrtid-enum*. A distilled water prepared from

MYSORE.

all parts of the plant is employed as a cosmetic, and called *Eau d'ange* by the French perfumers. The leaves are given in cerebral affections, for flatulence, diarrhoea, internal ulcerations, and rheumatism. The habb-ul-as, though nominally always the fruit of the myrtle, appears at times to be the small fruit of some other plants not yet identified with certainty. The myrtle grows well by layers, and even cuttings, but requires careful pruning, and after the rains all the leaves, on which insects have deposited larvæ must be removed, or the plant will lose its verdure and beauty by the destructiveness of the young caterpillars. — *Linclley, p. 75. MYSOLE, a large island of the Eastern Archipelago, in the Pitt Passage, extending E. and W. 42 miles and about 20 miles broad.

MYSORE, Maisur or Maheshwar, a kingdom in the peninsula of India, with a hindu Maharajah whose territories since A. D. 1831, have been administered by a Commissioner. It was usurped by Hyder Ali, a mahomedan soldier, about 1767; but when his son, Tippoo, fell, in 1799, at the storm of Seringapatam, the territory was restored to a descendant of the native sovereign. That chieftain, after he came of age, ruled the country till 1831, when, during Lord W. Bentinck's administration, owing to frequent insurrections, Commissioners were appointed for its management. The rajah died childless in the beginning of 1868, but he adopted a successor who, when of age,

MYSORE.

will take the Government into his hands. Mysore is a table land from 2,000 to 3,000 feet above the sea, fed by the Tunga, the Badra and Cavery rivers. Bangalore, Mysore and Seringapatam are its chief towns. The genealogy of this family is traced from the Yadu line of Chandravansa. The first in authentic history is Timma Raja Vadyar son of Betta, A. D. 1530, and the dynasty ruled until A. D. 1767. When Mysore was destroyed by Hyder Ali and the rajah Chamaraja Vadyar dethroned, but the late sovereign, Krishna Raja Vadyar, was restored by the British in 1799. The teakwood used by the Commissariat, and furnished to the Ordnance Department in the Mysore country, was, until about A. D. 1830, supplied entirely from the Mysore forests, in the vicinity of Shemogah. The jungle however was much thinned towards 1841, and supplies were got from Hullihal, from which to Bangalore is about 170 miles; the roads are tolerably good, the forest is distant from the village about 15 miles. Sheep of the Merino breed were introduced into Mysore by Sir Mark Cubbon. The coat is of wool, and the article manufactured from it was superior. A quantity of wool that was sent home to test the market value attracted the marked attention of the mercantile community. The principal difficulty appeared to be the cleansing the fleece from the penetrating spear grasses, with which the pastures of Southern India abound. Colonel Onslow also sent home some specimens of cotton to the same Chamber, who reported very favourably of it, and put upon it very high prices. A sample of Mysore gamboge, was sent to Dr. Royle, who pronounced it to be identical with the gamboge of Siam. The coffee is very fine, and a price is obtained for it in England nearly equal to that of the best Mocha. It is carried through the ghauts, to Mangalore. Fraserpet is situated on the road to Mysore from Mercara, and it is also 20 miles from the latter place. The river Cauvery runs past Fraserpet, and forms the boundary between Coorg and Mysore.

The great central table land of the peninsula of India includes Mysore, the Baramahal, the Ceded Districts (Bellary and Cuddapah), Berar, Hyderabad, the Southern Mahratta country, and the four Bombay collectorates in the western Deccan. The whole of these countries, with the exception of the parts immediately bordering on the ghauts, consist of a vast undulating plain of various height, almost entirely devoid of trees, except close to villages and towns, and with but little low jungle. Here and there low ranges of hills appear, and isolated rocks, or

MYSORE.

droogs, mostly bare, others covered with low brushwood. Towards the north and west large steppes occur, and the country is more broken by hills and ravines than in the southern part. Here too we have greater abundance of low jungle, and even stunted trees, and in many of the ravines wood abounds. Considerable tracts of long grass, or 'rumnaha' occur here and there, especially towards the more northern portion. The whole of this district was formerly named the Deccan meaning the south.

Hyder Ali brought Mysore proper, Coorg with the Carnatic and much of the Dekkan under subjugation, and was at the height of his successes when Chum Raj the titular ruler died. Up to this time Hyder Ali had professed to rule Mysore in behalf of the hindu rajah, and, every Dassara, Chum Raj appeared before the people in the state balcony, seated on an ivory throne, Hyder Ali being present as Commander-in-Chief and Minister, but he selected a successor, also named Chum Raj, from amongst the collateral relations, and Hyder continued to rule in reality until his death, on the 7th December 1782.

The climate of Bangalore or South Eastern Division of Mysore, is favorable to Europeans. The thermometer rarely rises above 90 degrees, and the nights all the year round are cool and refreshing. The elevation of the Chittledroog or North Eastern division is somewhat less than that of Bangalore. In climate it is similar, but the temperature must be higher; even for natives, this division is not considered so healthy as Bangalore, chiefly on account of its hills being feverish. The South Eastern division called Astagram, is very different in every respect from the two first named divisions. Its southern and western parts are covered with fine jungle extending to the slopes of the western ghats on the one side, and to the base of the Neilgherry Hills on the other. There is more rain and it is hotter in this division than in Bangalore; fever prevails during some seasons of the year, but on the whole the climate is generally a healthy one. The Nugger division to the north of Astagram possesses an elevation generally from 2,000 to 2,400 feet above the level of the sea; but there are some parts especially the Bababooden Hills which rise above 5,000 feet. The open country is described as healthy while the western half is more or less the reverse. Two talooks in this division are said to be higher and healthier than other parts. They are called Wustara and Chikmoogloor, and there are a good many situations in them where Europeans might settle with every probability of enjoying good health. On

MYSCORE.

this account these talooks appear to have been selected for the cultivation of coffee, and that plant was here more largely and more successfully cultivated than in any part of Mysore. It is added, however, that there now scarcely remains an acre of land in these talooks suitable for coffee unoccupied by natives, who are most tenacious of their rights to the soil. For health and suitableness to the European constitution Bangalore and its environs are best, Europeans might settle and labor there with every prospect of good health.

Captain Arthur of the Engineers found Native gold in Mysore, disseminated in quartz, and also in an incrustated clay: also some specimens crystalized, in minute cubes. Captain Warren discovered gold in Mysore in 1800, betwixt Annical and Poonganore, disseminated in quartz, and also in the alluvial soil. Two specimens were sent by Lieut. Puckle from the vicinity of Bangalore, one in a matrix of dark blue quartz, and another in black sand, a sufficient quantity was procured to make a ring. The natives have long been working for gold at Baitmungalum just above the ghats—Heyne mentions that Captain Warren had learned the fact of the natives so employing themselves, in their leisure, and the fact is repeated by Sir Whitelaw Ainslie and Dr. Clark, the latter of whom remarks that gold was discovered in the Eastern provinces of Mysore by Lieut. Warren of H. M. 33rd Regiment in 1802,—who found it in the small nullahs or ruts or breaks in the ground at Warrigum, a small village $4\frac{1}{2}$ miles S. W. of Baitmungalum, also on the banks of the Palar river, and the Ponian near Caargory. He found gold also at Marcopium three miles south of Warrigum, and worked by natives as it had also been worked by Tippoo. Heyne likewise (p. 41) states that gold has been found near the hills to the S. E. of Oosentah, and Newbold likewise describes gold as having been discovered by Captain Warren, near the Batterine hills.

A Mysore contingent of 4,000 soldiers has been kept up since the treaty of Seringapatam. The people of Mysore are mostly of the Vira Saiva or Liugayet sect.

The Beder or Veder race of Mysore live by the chase, as hunters and fowlers.

The Mysore toddy drawers are called Halipaik, they speak Tuluva.

The first war against Tippoo, king of Mysore, broke out in 1790. Tippoo attacked the rajah of Travancore but was defeated with considerable loss, General Medows,

MYTHE.

Colonel Maxwell and Colonel Hartley, having met with varied success, Lord Cornwallis, 1791, took command, and on the 21st March captured Bangalore. On the 13th May 1791, Tippoo opposed him at Arikera but was completely routed, yet Lord Cornwallis was obliged to retreat. In August 1791, however Cornwallis captured several difficult forts and on the 5th February 1792, he encamped before Seringapatam, and drove the enemy into the fort, and Tippoo came to terms, delivering up half his kingdom, three crores of rupees and two of his sons as hostages. Lord Cornwallis had reached Calcutta in September 1786 and on his return from Mysore, in 1793 he reformed the revenue system of Bengal by a perpetual settlement and he returned thence in October to Britain. Mysore territory seems to have been under the control of polygar chiefs, until Hyder Ali assumed the virtual sovereignty in 1742, but in 1799 it passed to a young man whom the British put upon the throne on the storm and capture of Seringapatam, when Tipoo fell in the breach. This Mysore rajah, ruled with little success till 1832, when, during Lord Bentinck's administration, the civil and military jurisdiction was delivered over to a commission, which continues in 1873, until the successor, a minor, come of age.

The taking of Bangalore from Tippoo sultan, on the 21st March 1791, gave the British a permanent position in Mysore, but it was eight years later, when Seringapatam was stormed on the 4th May 1799 that the country came under British control, by the replacement of the hindu descendant of former rulers on the throne. The Government was resumed in 1832 at a time when the country had fallen into a deplorable condition. Mysore town is on a table land 2,450 feet above the sea. Mysore table land covers an area of 30,886 sq. miles and contains a population of 2,300,000 souls. — *Madras Literary Society Journal: Universal Review*, p. 556. *Madras Exhibition Juries Reports*.

MYSORY or Schouten Island, in the neighbourhood of New Guinea, its northern point is in lat. $0^{\circ} 37' S$. It is high and 60 miles in extent.

MYSCORE-THORN, Eng. *Cæsalpinia sepiaria*, *Roeb.*

MYTHE, or Make, is a river rising in the Vindhya Mountains, lat. $22^{\circ} 32'$, long. $75^{\circ} 5'$; 1,950 feet above the sea. It runs N. W.

MYTHOLOGY.

145 miles, W. 25 miles, S. W. 180 miles into the Gulf of Cambay, length 350 miles. It receives the Amas 90, Manchun 55 miles. It is navigable for 15 miles from its mouth. At 50 miles up 100 yards wide.

MYTHOLOGY. All the Aryan races have a complicated mythology, which is not the case with the Semitic races. The latter have El, strong; Bel or Baal, Lord; Adonis Lord; Shet, Master; Moloch, King; Ram and Rimmon, the Exalted; and other similar terms for their deities. The Aryans, on the contrary, have Zeus, the sky; Phœbus, Apollo, the sun; Neptune, the sea; Mars, war; Venus, beauty, &c. Max Muller has very ingeniously endeavoured to explain this difference by the different character of the language in these two races.

Hindu mythology accords precisely with the Greek in sending the souls of the dead to receive judgment, and according to the sentence of their judge they are thence conveyed to Tartarus or Elysium, to Naraka or Sverga, according to their evil or good deeds.

Grecian mythology is largely mixed up with the mythology of India,—the Ceres of Greece has the Lakshmi of India, Eros of Greece is the Indian Kama, Yama or Dharmarajah is the Grecian Pluto—the Grecian Dionysius is the Indian Rama; Vaitarini in the hindu pantheon has its supposed analogue in the river Styx, and Cerberus has corresponding dogs. Amongst the hindus, mythology is all pervading. Their history, science, literature, arts, customs, and conversation, are replete with mythological allusions. A respectable knowledge of their pantheon is consequently an almost indispensable preparatory acquirement to the study and comprehension of nearly every thing which relates to them. The mythology of India has done much to explain that of Greece and Scandinavia as will be seen by the following list of the principal of the hindu deities of the present day, and their principal analogues.

Durga, is the analogue of Juno.

Narada, god of music=Mercury.

Krishna=Apollo.

Bhawani=Venus.

Kali or Durga=Proserpine.

Agni=Vulcan, fire, ignis.

Swaha, wife of Agni=Vesta.

Aswini-Kumara=Castor and Pollux.

Arana=Aurora.

Ata-deva=Diana.

Kuvera=Plutus, god of riches.

Ganesa=a male Minerva.

Indra=Jupiter, god of the firmament.

Varana=Neptune, god of the water.

MYTHOLOGY.

Prithivi=Cybele, goddess of earth.

Viswakarma=Vulcan, architect of the gods

Kartikeya or Skanda=Mars, the god of war.

Kama=Cupid, Eros, god of love.

Surya or Arka=Sol, the sun.

Hanuman, the monkey god, son of Pavana=Pan.

Rama, god of wine=Bacchus.

Hercula, an Indian deity=Hercules.

Aswiculapa=Esculapius=Genii.

Vaya=Æolus.

Sri=Ceres.

Anna-Purna=Anna perenna.

The religions of the ancient Greeks, though forming collectively one vast polytheistic system, were exceedingly numerous, and dissimilar in their character. Greece and Asia Minor seem to have been parcelled out among a number of deities, each of whom was the paternal god of some city or race, having not only separate rites, but a form of worship widely different. Each deity had his favourite abode, and local attachment; to some valley, or grove, or town, the power and presence of the divinity especially belonged, and hence in Boeotian Thrace, we trace the orgies of Bacchus; in northern Thessaly the worship of Apollo; on the Corinthian shores, the rites of Neptune; in Argos, the temples of Juno, and in Ephesus, the worship of Diana. Though acknowledged to be divine out of their own peculiar domains, yet their worshippers were rather averse to proselytism, fearing lest, by an extended communication, the local influence of the deity should be weakened. The sacred object of Ephesian worship, was carefully preserved, from the period of its first formation, through the ages which intervened, till the demolition of pagan temples, which followed upon the rise of christianity. The image consisted of a large block of wood of beech or elm, but, according to some, of ebony or vine, shaped into a likeness of the goddess, and evidencing its remote antiquity by the rudeness of its workmanship. The first statues were unshaped blocks and stones; and, hence, the word column, was generally used by the Greeks, to denote a statue. The Greeks worshipped Baal. They identified Baal with Zeus as they did Asarte with Venus. The heaven-fallen idol of Ephesus, was not a representation of the elegant huntress of classic fable, but an Egyptian hieroglyphic, a personification of nature. In this character she was pictured as a woman, having a number of breasts, to denote, according to Jerome, that, as nature,

MYTHOLOGY.

she was "the nurse, the supporter and life of all living creatures."

So, even to the present day, amongst the hindoos and other idol worshippers of British India, shapeless stones and pieces of wood are worshipped in every village; the three great idols at Jaggernath are three shapeless masses of wood and similar pieces of wood are used as deities on the left bank of the Bhémah river. Also every village has its own local deity, and the idol worshipped at Tripati is quite dissimilar from that at Scirangam.—*Lubbock's Origin of Civil*, p. 219. *Hind. Theat.* vol. ii. p. 106. *Milner's Seven Churches of Asia*, p. 83. *Sir W. Jones*. See Deo, Granfa deva, Hindoo.

MZARAI.

MYXA, or Egyptian plum of Pliny, is supposed to be the *Cordia latifolia*.

MYKEK. PERS. Cloves.
